

Introduction

Mapping the Field of Media History

John Nerone

ABSTRACT

Media history is an emerging field. Ambiguities about its object of study and modes of explanation make it difficult to define the boundaries of media history. It is possible to sketch out some existing formations of scholarly work in the area. This introduction offers some suggestions for mapping the field while it introduces the structure and contents of the handbook. It also addresses the received history of the field of media studies. It challenges the likelihood of the emergence of accepted grand narratives about either media history or the foundations of media studies, but proposes that the resulting anarchy is a sign of intellectual robustness.

Media history is an emerging field. Scholars across the full range of the social sciences and humanities now encounter the media as a phenomenon. As they work to comprehend the media, they often turn to historical work as a mode of explanation. There they are discovering a large and overlapping set of theories, problems, and texts. Working sometimes in dialogue with but as often mostly unaware of or unconcerned with each other, they are nevertheless beginning to generate the intellectual and institutional apparatus of an interdisciplinary field. No one knows whether the field will cohere or enjoy only a moment of dynamism before disappearing.

Ten years ago I addressed this emerging field in an essay in Blackwell's *Companion to Media Studies* (Nerone, 2003). Remarking on the various disciplinary sources of media history, I argued that there was a fundamental incoherence springing from a lack of recognition of what exactly was meant by the term "media," and that in fact there were two different notions of media in play in the field: one notion referring to technologies, and another referring to institutions. For many scholars, media are the tools of communication, like the telegraph, while for others, media are the organizations that produce and distribute news and entertainment, like the BBC. I did not at the time suggest a definitive resolution of this division, though I did point to areas in which scholarly formations seemed to be bringing together work across the divide. Revisiting this question a few years later (Nerone, 2006), I outlined three formations that seemed to promise coherence, or at least meaningful dialogue, among the many genres of media history: the history of technology, reconceived under the general principle of the social construction of technologies; the "history of the book," as a well-institutionalized meeting ground of disparate scholars with modest theoretical investments; and the history of the public sphere, migrating from Habermas's formulation into a more catholic notion of public spaces and practices. I did not predict success for any of these. Rather, I offered my own preference for continued anarchy.

James Curran offered another take on the fundamental diversity of media history in his book *Media and Power* (2002; see also Curran, 2009). Curran identifies a number of competing narratives of British media history: the dominant "liberal" narrative, and challenging "feminist," "populist," "libertarian," "anthropological," "radical," and "technological determinist" narratives. Each narrative in Curran's scheme brings certain moments and actors into visibility while obscuring others in a way that might seem incommensurable. Curran holds out hope for a coherent integrated narrative of media history, at least in Britain, emerging from a dialogue among metanarratives. It is a modest hope, but one that I do not share.

There are good reasons why there are so many narratives of media history. In addition to the disagreement over who is the protagonist (technologies or institutions), there are also disagreements over what supporting characters are most involved (markets, governments, individuals, gendered power structures), where the story is set (homes, communities, nations, virtual spaces, the globe), and what the story means. Is it a comedy or a tragedy? One might hope for settling these questions through a scholarly conversation. The most likely result of that is a shifting set of groups of like-minded scholars: sphericules. Or one might hope that the welter of specific narratives might harmonize on a deeper level, where a larger narrative fits them together by making them part of the same big story. But as you appeal continually to larger and larger narratives, you find that each one of them has competitors framed around different selections of character, setting, plot, and theme. Alas, it's turtles all the way down.¹ If order is to emerge from this chaos, it won't be brought by tellers of a grand narrative.

That's too bad for me, because I would have preferred to have composed a book that moved in a steady narrative line. And of course I have such a book in mind, as

I think every media historian does. But the task of this book is to represent the field, not to present an author's master narrative. This handbook offers a map of this still anarchic field. Each essay presents a relatively coherent assessment of a particular approach or problem or moment. A critic might contend that the essays add up to less than the sum of their parts. There are, by design, dissonant voices in this collection, and the intent is to have them work together to indicate the shape of the field.

In this introduction, I will try to spell out the contribution of the collection as a whole, and argue for the usefulness of thinking of media history as a field, in spite of the fact that it is hardly a coherent field.

Approaches

Media history is an interdiscipline that brings historical research into dialogue with the unruly tribe of communication theories. Historical research in this formulation can be of two sorts. One is the historical work of historians with degrees in history working in departments of history, and I'll refer to this in shorthand as history from now on. The other is historical work done by scholars in many other disciplines, and I'll refer to this as historical studies. History remains relatively non-theoretical. A sophisticated engagement with theory (or any substitute term, like interpretation or methodology) is not a requirement for a piece of work being determined good or valuable by historians. Good historical work is defined not so much by theoretical or methodological correctness but by two more pragmatic standards: whether the author has made a good-faith effort to look at everything relevant to the subject matter and whether the author has sufficiently addressed one's work to the ongoing conversations of other historians. Historians have paid attention over the past few decades to the theoretical underpinnings of historical narrative (White, 1973) and have also thought some about the stuff they draw on, the archive, and how it's been shaped and selected and preserved (Burton, 2003; Robertson, 2011; Smith, 1998). But attention to these discussions is a hood ornament of a history, not part of the engine or drive train.

Historical studies tend to be more engaged with theory and methodology. Historical sociology or anthropology or economics, for instance, often sets out to test a theory, or tries to clear the same methodological threshold as other research in the same discipline. Media historians often look like historical sociologists in this regard.

Media histories differ from other historical studies, though, in that they tend not to have a body of theory that they call their own. Media theory is an ad hoc assemblage of theories drawn from other fields and disciplines and then (sometimes) modified by being addressed to processes of mediation. At this moment, there is no standard version of media theory. Nor is there a standard list of communication theories. Communication scholars have been playing with schemata of media

approaches and theories for quite some time (Berelson, 1959; Craig, 1999), and may have moved closer to a standard taxonomy, but there are damned few theories that every media scholar is expected to know, and those don't seem to add up to either a worldview or a toolkit. Even if media studies is moving in the direction of coherence (an arguable proposition), other social sciences and humanities seem to be moving in the opposite direction, decreasing the likelihood that media studies will ever arrive at a moment of stabilization.

So when I say that media history mediates between historical work and communication theories, I'm not talking about a dialectic between two stable entities. Instead, both partners in this negotiation contain multitudes. As a result, the boundaries of media history are very difficult to describe. Those boundaries change not just in the present but in the past. Work that was written in previous decades gets hailed into media history in a process of irredentism² (Peters, 1986). Just as dead people may find themselves baptized into Mormonism, Elizabeth Eisenstein awoke one day to discover that she was a media historian.

Because of the ad hoc way in which media history has grown, this book takes a multidimensional approach to mapping it as a field. The first dimension, Part 1 of the book, consists of approaches, and represents the theoretical domain of media history. A critical reader will notice a hard core of dead white men at the top of this section – Marx, Innis, McLuhan, Foucault. Essays centered around figures like these are coupled with essays about approaches like race/ethnicity and gender. Those essays may seem to a critical reader to be compensatory, but they are not add-ons. Scholars of gender insist that every history has an element of gender to it, even if unacknowledged, in the same way that Marx says every history has an element of political economy to it. Each of these chapters is meant to take on a body of notions that can and should play in every work of media history. Any monograph in media history ought to acknowledge questions of class and economics, technology and culture, identity and discourse. These questions are not unique to media history or media studies, but they are fundamentally constitutive of any account of the media.

These chapters also begin to nominate entries to a canon. Media historians do tend to have read the same basic books. Some of these really belong to media scholarship. Harold Adams Innis, for instance, is read a little bit by economists and geographers, but is primarily taken seriously by media scholars. McLuhan has readers across the humanities, but is an exotic there, often invoked only as a straw man. Most of the authors of the foundational approaches had no investment in media scholarship so called. Marx, Foucault, and Habermas speak to the full range of the social sciences and humanities. Each of them inspired a next generation, also frequently cited here: McLuhan and Innis begat Walter Ong, James Carey, and Neil Postman (Marvin in this volume); Marx's work (Mosco in this volume) oriented Raymond Williams, Richard Hoggart, and Herb Schiller; numerous scholars of the history of sexuality, the history of science, and the study of governmentality continue the legacy of Foucault (Packer in this volume); Nancy Fraser and Michael Warner offered

contrapuntal voices to Habermas's. This second generation, too, did not have an investment in media studies as a field.

Also canonical is a range of historical work that sometimes tracks the theoretical work. The other Marx, Leo (Mosco in this volume), is an example, as is Eisenstein and a series of other scholars – Robert Darnton, Roger Chartier, Natalie Zemon Davis, Adrian Johns – who are identified with the formation that calls itself “the history of the book” (Zboray & Zboray in this volume). Benedict Anderson has had a tremendous impact among media historians, although often through a superficial appropriation of his concept of imagined communities. Scholars who study identity in media history (Soderlund and Squires in this volume) usually have read W. E. B. DuBois, Omi and Winant, and Joan Scott, who do not define themselves as media scholars, as well as Stuart Hall, who does. A pair of social histories from the last decade are more directly aimed at media history: Asa Briggs and Peter Burke's *Social History of the Media* (2005) and Paul Starr's *Creation of the Media* (2004). Briggs and Burke are historians by training, and Starr is a sociologist; their books were written with an awareness of their impact on media history but without an investment in an identity as media studies scholarship.

This canon-in-the-making outlines a common set of problems around which media histories orbit. These problems are not specific to media history, however, and are broadly shared across the social sciences and humanities. The problem of empire is the gravitational center of studies of writing and communication in the ancient world. The problem of the circuit of meaning is the central motif in histories of print culture, which tend to dwell on how ideas were disseminated through the production, distribution, and consumption of texts. The problem of the public gives urgency to journalism history and the history of freedom of expression and communication policy. The problem of the local and the global informs the study of the movement of messages through space and across borders, expressed in frames ranging from cultural imperialism to hybridity to modernization. The problem of representation is one of the more powerful drivers of the analysis of media content. The problem of capitalism appears in accounts of media commercialization, media ownership, consumerism, and advertising support. The problem of the modern and postmodern invites studies of how media forms hail people into configurations as readers or as audience members or as hybrid producer/consumers, and how media institutions and media professionals won and then lost the ability to stabilize meanings. Astride all of them is the problem of democracy.

Moments

The heart of this book is a set of chapters devoted to specific moments. The list of moments is non-exclusive and sometimes overlapping; some specific texts and authors appear in more than one of these chapters. One could easily imagine other

chapters and other organizations. Much of this particular list orients around communication technologies, like writing or the telegraph. Others deal with grand historical moments like the Enlightenment. The logic behind this selection is to follow the scholarship: to focus on objects around which work from various fields coalesces. There is an emphasis on English-language scholarship in this selection, but at least it's an ethnocentrism with a guilty conscience.

A number of topics appear recurrently in these chapters. These topics may come to be the ground on which broader media histories emerge. Among these topics are journalism, the public sphere, technology, markets, and policy; lurking as yet unrecognized is work. These topics are thoroughly entangled with each other, with the public sphere coming up repeatedly in conjunction with several others, and markets and policy continually making cameo appearances.

Journalism is a particularly well-represented topic. Journalism history is one of the oldest and most firmly institutionalized modes of media history, claiming its own scholarly organizations and journals. For all that, it is not a deeply thought-through field. Even now, as journalism as a normative practice, as a viable occupation, and as a social institution is experiencing disruptions that commentators label a crisis, journalism historians are slow to recognize the stakes (Nerone, 2011; for two remarkable exceptions, see McChesney & Nichols, 2011; Zelizer, 2010). But the emergence of a recognition of the transnational dimension of journalism's history is one of the more promising developments.

Four essays in Part 2 specifically address journalism, and they are broken down geographically. In addition, a fifth deals with the international wire services, the infrastructure of a global news system that has had powerful influence on national developments. The geographical chapters deal with Europe (primarily Germany, France, and Britain), North America (primarily the United States), South Korea, and China. These are mostly narrative in structure.

Differences in the style and tone of these pieces reflect regional differences in both scholarship and news systems. The European history (Wilke in this volume) takes primacy in time; the Europeans invented the term, and inaugurated what became a global practice. The European invention of journalism is characterized by fragmentation along national lines and by strong interaction with states, which entailed an emphasis on centers of power and especially capital cities.

Modern journalism grew from both the struggle to free the press from state control and the rise of new, more market-oriented business models. The first was framed in the West by a notion of the public sphere; it is a matter of debate whether its development resembled the Habermasian model. In North America, and particularly in the United States (Kaplan in this volume), a set of normative ideas about how the press was supposed to facilitate the public deliberation of citizens exerted a gravitational force on public policy, especially the construction of a postal system as an infrastructure for the press (John, 1995; see also Chapter 13, this volume). Coupled with artisanal production by printer-editors, the North American system took on a fundamentally different cast than the European one that had seeded it. It also provided a resource for an emerging system of mass popular politics.

In the mid-nineteenth century, a combination of a market revolution (Sellers, 1994) and the emergence of a telegraph–railroad infrastructure transformed the news system (see John in this volume). A more commercialized press began to produce a news culture distinguished by event-oriented and eventually neutral or objective items that acquired commodity value through the labor of reporters and through distribution as saleable items through the wires (Barnhurst & Nerone, 2001; Chalaby, 2000). When news organizations industrialized – became big businesses among other big businesses – they repurposed elements of the norms of the public sphere into an ideology of professionalism and social responsibility that could explain and justify the power they were recognized to hold. They encouraged the growth of journalism degree programs in colleges and universities. They began to export this ideology to the rest of the world. The Western wire services created a global news system in the second half of the nineteenth century (see Rantanen in this volume), forming a material base for the transmission of Western journalism as a news style.

The Asian chapters are again quite different, reflecting both the remarkable transformations of the countries they cover and the challenges of present-day journalism and journalism education in those countries (Kim and Chen & Wang in this volume). The histories they tell share a series of themes: a prehistory of “indigenous” journalism in the court papers of Confucian monarchs, an encounter with Western colonialism, an initial encounter with Western forms of journalism, the interaction of journalism with a struggle for national liberation, the transformative impact of World War II and its aftermath the continuing negotiation with state power, and the extraordinary recent experience with digital technology.

The journalism history chapters are more concretely institutional than the rest of the book. They can tell the story of a recognized formation of practices and ideas embodied in organizations that have left archives and that interact with other agencies like states, universities, and advertisers who also generate archives. They can work from a significant body of previous scholarship on specific news organizations, journalists, legal controversies, and national press systems. There is a global history of Western hegemonic journalism. At the same time, the boundaries of this history are not settled. This is most clear in the Asian case studies, in which hegemonic Western journalism has only somewhat colonized the news system, while other journalisms, ranging from Confucian admonition and Maoist self-criticism to citizen journalism, offer counter-histories. The act of writing journalism history, in such a fluid situation, can contribute to a redefinition of journalism’s identity.

The chapters on technologies are more abstract. Most trace the assembling of elements into familiar forms – instruments or assemblages – that have some built-in affordances that in turn provide some agency in historical processes. Historical work on communication technologies has settled in to a middle ground between the sort of muscular technological determinism argued by Innis and McLuhan and a contrary argument from social determinism that can be found everywhere from Milton’s *Areopagitica* to the limited effects model of media influence. In this middle ground, there is a soft determinism that comes from the way technologies are socially constructed.

The history of the printing revolution provides a convenient parable of the interplay of these positions. From the Renaissance to the scholarship of Innis and McLuhan, the printing press was celebrated as the tool that enabled Western civilization. A large body of scholarship based partly on careful research into the invention and dissemination of print technology in fifteenth-century Europe (mostly ignoring its invention in other places) and a formalist analysis of the abstract technology saw powerful effects generated more or less automatically. The most hyperbolic version of this position is McLuhan's *Gutenberg Galaxy*, which attributes to printing not just Western rationality but also the discovery of depth in perspective, a side effect of a reorganization of the sensorium. An initial rejoinder to this hard technological determinism came from Elizabeth Eisenstein's epic work, *The Printing Press as an Agent of Change* (1980). As its title suggests, Eisenstein's book also sees powerful effects, but they come about because printing reorganized the environment of European intellectuals through the mass reproduction of standardized texts. Still, Eisenstein settled on a feature of the technology as the prime mover of this agency and called it "typographical fixity." A generation later, Adrian Johns (1998) introduced another dimension of social construction, arguing that fixity itself was a characteristic that had to be built into printing, and that initially printing had introduced heightened uncertainty into intellectual life by spawning uncontrollable flows of forgeries and piracies.

The chapters on technology in this volume deal with a broad range of objects: writing (Peters), printing (Kittler), the telegraph and telephone (Rantanen, John), sound technologies (Rothenbuhler), photography (Robertson), motion pictures (Wasson, Wasser), broadcasting and television (Ouellette), computing (Grier), and mobile telephony and other digital technologies (Andrejevic). These chapters too are quite diverse. John Durham Peters explores a vast history and a large spectrum of scholarship on various writing systems, while David Alan Grier offers a minute examination of a string of applications of computing technology to newspaper production. In spite of this diversity, several common themes emerge.

Each of these technologies is presented as socially constructed at some level. Usually the construction involves the interplay of different types of actors. In the industrial era and after, the interplay generally assumes similar forms across culture industries (see Wasser in this volume), which constitute a kind of braiding of four histories: of science, of entrepreneurs, of regulators, and of publics or audiences. The history of theatrical film is a good case in point. There is a scientific history stretching from the camera obscura through the development of photography and the magic lantern to different apparatuses for film exhibition; this trajectory can be captured in shorthand form by narrating innovators in a sequence: Daguerre, then Muybridge, then Edison, more or less. Then there are the various attempts to monetize these innovations through first a "cinema of attractions" (Gunning, 1990), then through a variety of projection venues, culminating by the 1920s in the classic studio system in the United States, with parallel histories in some other countries. As entrepreneurs competed for market control, they engaged with the state on several levels: as regulators of exhibition spaces, as censors of film content, as enforcers of antitrust

law, and perhaps most importantly as enforcers of patent and copyright law, which became the key tools by which some measure of industrial control was maintained. Throughout this history, ordinary people inflected developments continually: as consumers, as fans, as crowds, as voters, and arguably as cultural citizens in a cinematic public sphere (Hansen, 1991). So the social construction of theatrical film involved a complex negotiation among many different actors, with the decisive role being played sometimes by entrepreneurs, sometimes by policymakers, sometimes by audiences, and sometimes by technicians. Similar stories are told about many technologies in this volume.

One narrative arc that reappears often in these pages is mobile privatization. Initially coined by Raymond Williams (1971) to describe the vector behind the social construction of television, mobile privatization denotes the deep drive in modern capitalist societies to reconfigure practices so that people can engage in them as private individuals or nuclear families moving freely through social and geographical space. Mobile privatization offers a shared trajectory uniting disparate objects and systems that moved activities from public to private ownership and control in the course of the rise of mass consumer societies: the automobile, moving transportation from trams and railways to the suburban garage; the refrigerator, moving food storage from the public market to the family kitchen (Hartley, 1999); the telephone, moving social interaction from the public street corner to the private parlor; and, of course, radio and television, moving entertainment from the public theater to the living room (Hay, 2006). Media technologies help people move more quickly and smoothly through shared spaces too, providing a kind of capsule (de Cauter, 2004): think of the way a newspaper can be held up as a kind of shield, preventing unwanted interaction on a bus or subway; or the way people submerge their gaze into a smartphone, effacing their surroundings and immersing themselves in an extralocal environment. Common sense tells us that mobile privatization sums up much of the work of the developing digital media system, intensifying the capsule of privacy by detaching it from the defined space of the home and the car. But even within this very convincing narrative there are contrary positions to hold, one in which the tools of mobile privatization are “technologies of freedom” (Pool, 1984), and another in which they are “technologies of oppression” (Howard, 2010, pp. 13–14).

The “technology of oppression” version of mobile privatization runs along two tracks, which we might call Foucault and Marx. The Foucault track sees the mobile private individual as the ideal subject of neoliberal governmentality, deploying the tools of digital communication to render oneself visible to surveillance and at the same time better self-disciplined. In the Marx track, mobile privatization accelerates the expropriation and accumulation of wealth, in large part by capturing unpaid labor that people misrecognize as play or leisure. The latter is Smythe’s (1994) argument in his famous “Blindspot” essay. It is also the argument of numerous critics of Facebook.

Late capitalism is another overarching topic in the essays on technologies. Repeatedly we see firms and corporations competing for monopoly control of industries. In turn, we see industries that are prone to concentration because of either

economies of scale associated with production technologies (see, for instance, the essays by Kaplan and Stole) or apparent instances of “natural monopoly” (see John and Rantanen). Media technologies tend to produce bottlenecks in distribution, either because of aspects of the technologies involved or because of the collusion of policymakers in reinforcing the market control of specific interests, for instance in spectrum allocation (McChesney, 1993) or in intellectual property law (Lessig, 1999). Yet monopoly is consistently seen as a problem. The media system is supposedly one of the infrastructures of democracy, so it follows that, if there are pools of monopoly in the media system, the media power generated will distort the conduct of public deliberation. A liberal could argue that the public sphere itself must be a monopoly. Even counterpublics cannot operate effectively in the absence of a hegemonic mainstream public sphere. How else can a coherent public opinion emerge? And if the public sphere must somehow exercise a monopoly, wouldn’t the media that serve it eventually, if only for efficiency’s sake, have to share some monopoly characteristics? Still, even conceding that, wouldn’t we want that monopoly power to be publicly held?

Work is a topic that is the direct subject of only one essay (Barnhurst) but that figures in a few others as well (Wasser, and also the essays on journalism). Media work usually has been thought of as white collar work, and the most familiar media occupations have either sought to professionalize or to control the labor market through unionization. These workers’ movements have had varying success, depending on where and when you look; for the most part, “technical” occupations have organized more successfully than “creative” ones (including journalism as a creative occupation). Where media workers have won some measure of autonomy, there has often been a gender component; autonomous work is gendered male, historically. Women have often had to fight a war on two fronts in media workplaces – one against simple exclusion, and the other against a masculine workplace culture.

Implicit in the scholarship on these moments, as in much communication scholarship generally, is the unspoken presence of democracy as the master problem. Democracy appears in its political guise in the essays on journalism and in invocations of the public sphere; it appears in its cultural guise in the essays on media technologies. In either arena, democracy is supposed to involve dispersed and shared power, freedom from coercion, and an ability to engage in meaningful action in part through communication. For most of the scholars represented in this collection, and in this section in particular, the history of the media has not been a story of steady progress toward democracy. At the same time, it is hard for these and other media scholars to imagine democracy without the media.

The Foundations of Media Studies

The question of democracy also runs through the history of media studies. Part 3 features a series of essays on key moments in the history of media studies. A critic

might say that this part of the book is linked to the first two only by the accidental appearance of the word “history.” On the contrary, the history of the study of the media is in fact a modeling of the history of the media themselves. The rhythm of the life course of the field reflects a negotiation between the history of the media system and the history of the academic organizations and institutions that have housed its study and their own negotiations with the political forces that shape them.

There are three major moments in this history. The first extends from nineteenth-century arguments about the breakup of traditional communities in the process of industrialization and modernization, to World War I-era anxieties about the power of propaganda. The second moment overlaps with the first, examining the influence of media messages and media forms on public opinion in modern democracies, with the conflagration of World War II and the settlement achieved in Western countries afterward as pivotal. The third moment stretches from the critique of liberal versions of the influence of the media in democracies to the collapse of mass communication as a business model and the rise of networked digital communication in the past few years. Each moment engages with a specific dominant version of the media. The first moment engages mostly with “the press,” the second with “mass communications,” and the third with “media.”

The first moment (the subject of essays by Hardt, Collins, and Wahl-Jorgensen in this volume) began with the question of the impact of democracy and free markets on culture and politics. Key nineteenth-century statements of the question were de Tocqueville’s *Democracy in America*, Mill’s *On Liberty*, and Le Bon’s *The Crowd*. In Germany, whose universities produced the founders of graduate programs in US universities, sociologists took on the study of the press as an institution, framing its social importance in terms of the shift from community to society. One product of German university education was Robert Ezra Park, who became a key figure in the Chicago School of sociology.

Park’s career offers a neat container for many of the influences of this early period of media studies. As an undergraduate at the University of Michigan, he studied with John Dewey (who later moved to Chicago and then to Columbia University, both key locations for the gestation of media studies). Upon graduation, Park went to work as a journalist. Then he took an MA in philosophy at Harvard, where he studied with William James. He then did postgraduate work in Germany, studying with Georg Simmel at Berlin and then Wilhelm Windelband in Heidelberg, where he took his PhD in philosophy. He returned to the United States and taught briefly at Harvard before going to work with Booker T. Washington at Tuskegee. In 1914, he joined the sociology department at the University of Chicago.

Park’s combination of US pragmatist philosophy and German sociology was characteristic of media studies in the early decades of the twentieth century. Media had been called forth to fill a vacuum in meaning making for populations uprooted by industrialization and urbanization. Chicago was a particularly interesting laboratory for studying such media. The population of Chicago included large pools of recent immigrants, divided by language, nationality, religion, and political

persuasion, segregated by neighborhood and exploited by employers and purveyors of goods and entertainment. Assuming the posture of progressive reformers, sociologists surveyed this population to find out how media took over the role of cultural authority left vacant by immigration and social transformation, processes which had eclipsed the authority of parents, community, churches, and schools. Chicago sociologists and their fellow travelers, like George Herbert Mead and John Dewey, hoped that the media system would replace the meaningful culture produced by interaction with local communities by allowing people to form an equally meaningful culture rooted in a "Great Community" (Dewey, 1927), and that this culture would allow democracy to flourish in what Wallas had called the Great Society.

The press assumed great responsibility for constructing the great community. For Dewey and many others, the press had underperformed. Early media scholarship drew on a generation of populist criticism of the press as a big business, seeing it as in thrall to the "money power," as muckrakers called concentrated wealth at the beginning of the twentieth century. The climax of this moment of press criticism, and of this moment of media studies, came in the response to World War I. The Great War had given scholars a chance to see the power of propaganda when directed by central governments and deployed through the press. The disillusionment expressed in Walter Lippmann's *Public Opinion* (1922) is understandable, considering Lippmann's participation in the Wilson Administration's efforts to make the war make the world safe for democracy. Lippmann linked his critique of press performance to an indictment of market forces, on the one hand, and of the flawed cognitive machinery of ordinary people on the other. Both parts of that critique yielded research agendas for communication scholars.

The second moment, the moment of mass communications, overlapped with the first. For scholars of Park, Dewey, and Lippmann's generation, the question of the media also involved a fear of cultural anarchy springing from the strangeness of new urban populations. Eastern and Southern Europeans mixing with older immigrant populations from Germany and Ireland and occupying neighborhoods next to growing African American ghettos seemed defenseless against the material that appeared in their newspapers and, beginning in the first decade of the twentieth century, on their movie screens. The influence of the movies became a major topic of concern. An audience that included many young people as well as many immigrants seemed especially vulnerable to the obvious emotional and sensual power of the motion picture. And this power was wielded by shady entrepreneurs employing stars of questionable morality. It was this set of anxieties that produced the first massive funded study of media effects, the Payne Fund studies of motion picture influences. It also informed the early studies supported by Rockefeller Foundation funding, like Robert and Helen Lynd's *Middletown*. In a more radical vein, an anxiety about the way the media system might mimic fascism marked the work of Max Horkheimer, Theodor Adorno, Leo Lowenthal, and others of the Frankfurt School (see Kellner in this volume).

Meanwhile, other researchers undertook studies funded by sources more interested in applications for profitable media operation. Advertising agencies wanted to be able to tell their clients scientifically what worked to convince consumers; broadcasters wanted to be able to tell their advertisers scientifically what sorts of people watched which programs; political groups wanted to know scientifically how public opinion stood on matters of relevance to elections. This sort of “administrative” research did not fear the power of the media but wished to harness it.

All of these strains came together at a few key institutions. Chief among them was Columbia University, where Paul Lazarsfeld headed the Bureau of Applied Social Research. Lazarsfeld unsuccessfully courted scholars like Adorno and C. Wright Mills, while forming more harmonious partnerships with Frank Stanton, the head of CBS, and Robert K. Merton. Yale University was another key center, housing social psychologists studying media influence like Carl Hovland and political scientists like Harold Lasswell, who wrote formative volumes on propaganda.

As World War II approached, many of these scholars were recruited by the Rockefeller Foundation into a communication seminar that met regularly to try to formulate some covering procedures and terminology for what looked to be an emerging social science discipline. Wilbur Schramm, a product of Harvard and the University of Iowa who would later found PhD programs at Illinois and Stanford, was also a member of this group. When the United States entered the war, most of this group played a role in the war effort, working with the Office of War Information.

World War II produced a settlement among the competing schools of studying media effects. The compromise consisted of an identification of the problem with the so-called “5w” model of communication processes – who says what to whom through which channel with what effect. Media effects would thus take the form of changes in individuals’ attitudes, and would be measurable through survey research and experimental study. And a rough set of parameters for findings also appeared at that point in what later came to be called the “limited effects” model (Simonson in this volume). In the limited effects model, media content changes attitudes only under specific circumstances and only with the help of opinion leaders or support from a primary group. The major function of the media in this model was reinforcement. Institutionalized by Lazarsfeld and his students, especially Bernard Berelson and Elihu Katz, this model remains very influential.

Left out of the postwar settlement in media studies were radicals of the left and cultural critics of the right. These continued to voice criticism of “mass culture” and “mass society,” seeing the “mass media” as a central element. On the left, the strongest statement of this position came in the book *The Power Elite*, by Lazarsfeld’s estranged protégé C. Wright Mills (1956).

Through the 1950s and 1960s in the United States, academic work tended to confirm the limited effects model. In the 1970s, a number of approaches appeared, proposing stronger media effects but remaining within the limited effects paradigm and applying the same methods. Among the more vital are agenda-setting, spiral of

silence, and uses and gratifications. It is notable that the first two deal primarily with news media. In the 1980s and 1990s, studies of news media influence would also embrace priming effects, framing effects, and indexing, all indicating that the news system could function as an extension of power.

Intimations of media power really blossomed in the Western academy after 1980. By that time, numerous forces outside the academy had already argued the case for media power. In the United States, the civil rights and antiwar movements found a media voice only after a long struggle. On the global scene, a movement for a New World Information and Communication Order had appeared, sponsored in UNESCO by members of the Non-Aligned Movement (see Nordenstreng in this volume).

The rise of critical approaches to media studies can be looked upon as a shift in object of study from “mass communications” to “the media.” To some, the media meant the media system, and was understood as a subsystem of industrial capitalism (see McChesney in this volume, on the political economy of communication). To others, it meant the multiform cultural environment of industrial societies (see McCarthy and Logue in this volume, on cultural studies). Both of these strands drew inspiration from the Marxist tradition, with the political economists crediting Smythe, Schiller, and Garnham and cultural studies scholars crediting Williams, Thompson, and Hall. A broad area of agreement was often obscured in the 1980s and 1990s in the United States and United Kingdom – mostly in the United States – by eruptions of pointed disagreement.

Conclusion

The history of the field in this volume trails off in the 1990s, before the advent of digital media. It is likely that the field will reconfigure itself as the impact of the digital environment becomes clear. The rise of network media will oblige some of us to rethink what we have meant by media, and when we do that we may also have to rethink media history.

The useful lessons of history usually begin with a negative. “Never forget” is the prime example. In media history and in the history of media studies, the obvious lesson might be stated this way: “Don’t assume that the term ‘media’ has a stable meaning.” The word itself is relatively recent in coinage, at least as a term applied to communication. In the nineteenth century it was applied to people who communicated with the spirits of the dead. But before that it referred in art, physics, and chemistry to the material that a work or a process used. Air was a medium for sound. Canvas was a medium for painting. Gelatin was a medium for growing bacteria. In the 1920s in the United States it came to be used in advertising agencies to refer to anything that could carry an ad, replacing the term “space,” which had been made archaic by the advent of commercial radio. Only in the second half of the 1930s did that usage become more commonly seen in scholarly and popular writing. In fact, the word was novel enough in the 1960s that many thought McLuhan had invented

it. In the 1930s, media referred to radio, magazines, newspapers, and motion pictures; in the 1960s, television was the dominant referent. Now “new” media, or network media or social media, are displacing television and the press in both popular and scholarly conversations. So the meaning of the word “media” has changed several times in the lifespan of the older living media historians.

Therefore, to return to the theme I struck at the beginning of this introduction, we can expect continuing anarchy, both in media studies and more specifically in media history. There are neither the intellectual nor the institutional resources to stabilize either of them as a discipline. But again I think this is a good thing. There is a persisting illusion that knowledge, and especially historical knowledge, works best when it is authoritatively known. Granted, we want to be able to work with a vast array of solid facts or information; nothing is more useless than a debate in which everyone gets to make up their own facts. But historical knowledge is not *per se* factual; rather, it is interpretive. And if everyone agrees on the interpretive level, then the production of new histories becomes a tedious antiquarian enterprise. It is the interplay of master narratives that makes media history so appealing as a field. One could say that there is too much anarchy; exercises like this book are meant to offer some kind of order. They can try to bring researchers in the field into conversation with each other, and to make them more aware of their compatibilities and dissonances. They cannot, however, make this field into a discipline.

NOTES

- 1 One version of this saying comes from Geertz (1973, p. 27): “There is an Indian story – at least I heard it as an Indian story – about an Englishman who, having been told that the world rested on a platform which rested on the back of an elephant which rested in turn on the back of a turtle, asked (perhaps he was an ethnographer; it is the way they behave), what did the turtle rest on? Another turtle. And that turtle? ‘Ah, Sahib, after that it is turtles all the way down.’”
- 2 Irredentism refers to attempts to “redeem” lands ruled by another country on the basis of claims about ethnic solidarity or historical possession.

Media Studies

The Interdiscipline of the Present and the Future

Angharad N. Valdivia

Media studies is a rapidly growing, widely relevant, and evolving field – an interdiscipline (Valdivia, 2003). While some scholars have bemoaned the loss of focus on process and effects, especially on milestone studies (DeFleur, 1998), others find the breadth and porous contours to be conducive to a worthwhile intellectual pursuit (Sterne, 2005). To be sure, between 1998 and the present, there has been a huge growth in interpretive and critical approaches, which have nonetheless flourished in the margins as the effects paradigm – the stuff of milestones – has firmly retained its central place in the field, at least in the United States and the Netherlands. Indeed, efforts to map out the diversity of the field of communication (Craig, 1999, 2001), which we might call the broader umbrella for media studies, yield a multiplicity of sometimes overlapping and other times mutually exclusive approaches. The terrain of contemporary media studies acknowledges that most of us live in intensely mediated environments, so that Livingstone (2009) writes on the mediation of everything, and Hay (2000) writes of refrigerator studies. The former expands on how media and communication are “ever more crucial in today’s world” (Livingstone, 2009, p. 13), and the latter asks us – as a field over a decade ago, while continuing to encourage us (Hay, 2010, 2011) – to consider the broader web of networks to which other technologies, such as refrigerators and toasters, contribute in terms of routines and practices that serve to mediate the world for us. The latter line of questioning has proven immensely prescient as many of us live in highly networked webs of media and communication, where not only can our location be pinpointed at any given moment thanks to elements in our mobile technology, but also, if we chose to, we can broadcast a narrative of our location and other audiovisual bits of information constantly to many – such as our hundreds of Facebook friends and Twitter or Tumblr followers.

Nonetheless, whether we are talking of old media technologies or institutions (see Nerone, Volume 1, *Media History and the Foundations of Media Studies*), we are witnessing the constitution of new audiences and a shift in traditional audiences (see Parameswaran, Volume 4, *Audience and Interpretation*) through the invitation offered by seductive content in a dynamically converging and synergized media environment (see Mazzarella, Volume 3, *Content and Representation*). The effects of these technologies and content continue to be measured and studied (see Scharrer, Volume 5, *Media Effects/Media Psychology*). While media platforms and patterns of production are converging, enduring tendencies toward concentration of ownership and control of media industries coexist with the emergence of new patterns of labor, practices, and updated forms of exploitation (see Mayer, Volume 2, *Media Production*, as well as some chapters in Gates, Volume 6, *Media Studies Futures*). This is not surprising given the rapidly expanding new media and communications technologies, many of whose functions replicate previous technologies while other uses (and abuses) bring new possibilities, utopian and dystopian, to the fore (see Gates, Volume 6). Unexpected global locations of nodes of influences result in previously unsuspected transnational alliances and networks (Castells, 2009).

As an early caveat to this triumphal celebration of media, I must remind readers that most of the above sentiment refers to a media-rich group that luxuriates in a wealth of networks and technologies. Yet we must not forget that even as I write this introduction at the very end of 2011, fully 50% of the global population have intermittent access to electricity. Mobile telephony may be widely spread, but the radio remains the most reliable global medium (see the *Journal of Radio Studies*). Beyond the fact that it is cheap, it neither relies on nor requires electricity or literacy, in English or any language. Furthermore, despite our current fixation with digital, wireless, and mobile media technologies, in times of crisis – whether natural such as a huge earthquake or in wartime – when the electric networks are down and we are thrown back into old school forms of media and communication, radio returns to its central location as a reliable and essential medium. So before you continue reading this introduction, or continue to read any of the absolutely outstanding volumes of this encyclopedia project, go out and buy yourself a radio – one that is both electric and battery powered. You might never need it, but if you do, you will be very relieved to have it.

The fact is that media are everywhere, and nearly everyone shares lifelong experience with and expertise on particular forms of media. Dating back to the 1920s – as identified both in Nerone, Volume 1 and Mazzarella, Volume 3, the study of media has been multi-modal and heterogeneous. Theoretical and methodological complexity has grown since the Payne Fund Studies. International, transnational, and global perspectives have become absolutely essential. Not that they ever were not, but now that media are produced, consumed, and circulated transnationally, media studies has to take this into account. Inclusivity of the heterogeneous components of the population in regard to the media has also grown. Scholarship that was once nationally bound and focused on White middle-class males has expanded to take into consideration gender, nation, region, age, ethnicity, sexuality, ability, and class.

Furthermore, as both Downing (2003) and Castells (2010) remind us, we must not forget the importance of religion in the contemporary world, as many armed conflicts revolve around religion, and media content, production, audiences, and effects are interlaced with religious impulses.

Media studies is an interdiscipline. As such it draws on and benefits from a number of contributing fields such as history, philosophy, psychology, political science, education, literature, and sociology. Yet even as it draws on those many fields, it is its own area of studies. Too often other fields, whose interdisciplinarity takes them into media studies, see this interdiscipline as new – as in, “oh look, we just discovered that we ought to look at media.” Our field becomes the direct object of other scholars’ deployment of the myth of discovery. Just like Columbus discovered “America,”¹ scholars from other fields continue to “discover” media and media studies. A century’s worth of theories and research disappears in the process, and many of us often find ourselves in other disciplines’ conferences listening to presentations that implicitly suggest direct effects, transparency, mimetic images, and so on. Transparency, when media content, industries, audiences, and practices are treated as if they spoke for themselves, as if there were no mediation, is often the tactic taken by scholars outside our discipline. What we as a field contribute to the understanding of culture and society is, at the very least, that mediation is complex and that understanding mediation helps us to uncover patterns of power, distribution, and potential justice. Media studies is about unearthing and maximizing the democratic potential of practices, institutions, technologies, and audiences that pervade our contemporary life.

Nonetheless, as Gates reminds us in her introduction to Volume 6, one central question for both the present and future of media studies concerns the very definition of media: What counts as media now that it no longer makes sense to limit the term to film, television, audio, and print? Does it still make sense to refer to a broad concept or category of “media”? If the more appropriate terms are “digital media” or “new media,” then what do *these* terms encompass? Terms like “convergence,” “remediation,” “interactivity,” and “user-generated media” capture a general sense of current transformations, but what are some productive ways of parsing out the complex dimensions and issues that these terms encompass? By paying careful attention to issues of history and context, this encyclopedia seeks to trouble the usage of these terms even as they are used rather carelessly in popular culture and public policy.

The six separate volumes of this encyclopedia were present as six separate sections in *A Companion to Media Studies* (Blackwell, 2003), the volume that provides the model for this encyclopedia and that was, in turn, modeled after McQuail’s *Mass Communication Theory*. The editors of the individual volumes put together a stellar cast of authors who in turn produced original chapters. All volume editors were asked, indeed implored, to compose a table of contents that was inclusive in many ways. First, inclusivity in terms of global topics was paramount, and we strived for inclusivity in terms of authors and global regions as well. This, as I have discussed elsewhere (Valdivia, 2011b), is not as easy as it sounds. Differential access to the latest

research, culturally different approaches to writing and developing an argument, resources that might enable a given scholar or team to develop a project and get it ready for publication, and so on, are all variables that effectively discriminate in favor of those of us in well-funded research universities in wealthy countries. We recruited some scholars whose work we translated into English, and all editors worked assiduously to cast as global a network as possible.

Another element of inclusivity was paradigm diversity. Schooled at the Institute of Communications Research (ICR) at the University of Illinois, I am the recipient of an educational tradition that highly values paradigm inclusivity. Insofar as it was possible, we included scholars using quantitative and qualitative approaches, sometimes both of them at the same time. Obviously the *Media Effects/Media Psychology* volume focused solely on the social scientific tradition, while both the *Content and Representation* and *Audience and Interpretation* volumes included scholarship using both approaches. A third element of inclusivity was gender, race, and sexuality diversity. Cutting across as a focus that can be conducted in the research included in any of the six volumes of this project is the work of transnational feminism and globalizing gender studies (Hegde, 2006). Editors sought scholarship that would include these vectors of difference, as media studies really makes no sense without their consideration. Yet even within each of these categories we encounter new gaps that merit more research. For example, as Mazzarella mentions in the introduction to Volume 3: “the reader might notice that the volume is heavy with studies of cultural representations of females. Indeed, seven chapters deal with some aspect of this topic, while only one deals with masculinity. Yet this is representative of the field, as studies of media portrayals of women and girls have been very prolific, and media studies scholars have only recently begun to seriously study mediated portrayals of masculinity(ies) (Mazzarella, 2008).” The rise of masculinity studies follows feminist studies as a logical move once we realize that femininity is socially constructed. Indeed, this is a process that this collection of volumes entices us to accomplish: a greater degree of preciseness to this complex concept of media studies, which all of us who work within the interdiscipline intellectually seek to explicate.

As a final note about process, these volumes have been peer reviewed in an innovative manner for an edited collection. First, each table of contents was submitted to the peer review of a senior scholar within that area of the field and edited accordingly. Then, as the chapters came in, within each volume authors reviewed other chapters. Ideally, each chapter was reviewed by two other authors as well as by its editors. As the overall editor of the project, I carefully reviewed all volume editor introductory chapters. Now the review process is turned over to you, the reader.

Media Studies Today

As an organizing principle for this book, I have followed since 2003 the structure provided by many different editions of Denis McQuail’s *Mass Communication Theory*:

An Introduction. Dating back to the first edition in 1983 and up to the sixth edition in 2010, whose name has changed, appropriately enough, to McQuail's *Mass Communication Theory*, Denis McQuail provided a manageable way of dividing up the field into components that, while overlapping – as they had to be since these components were teased out more for scholarly inquiry than because they are discrete and differentiated – provided a useful way to look at the breadth of study of the media. We all experience media as an integrated experience. Media inherit values and histories that are in turn explicitly or implicitly incorporated into their production; then we either consume and/or interpret media in relation to regimes of representation, with particular audiences and interpretive tactics in mind, with some desired effects over which we have little control, and contributing to a future that – like effects – we wish we could influence but really cannot. Still for the purposes of research, we tease out the media experience into a number of areas.

The volumes of this encyclopedia match the sections of the *Companion*, which used McQuail's schema and added the "futures" section. Thus we have history, production, content and representation, audience and interpretation, media effects/media psychology, and futures. We will later add a "methods" volume to complete the encyclopedia. While these areas are teased out for the purposes of research, there is great cross-pollination by scholars in media studies. We find that some scholars use both qualitative and quantitative methodologies, or at least rely on both. We also find that many scholars write about two or more of the six areas mentioned above. For example, a scholar such as Francombe (2010) combines the study of representation with attention to issues of labor. Durham (2004) combines analysis representation with exploration of audience and interpretation. These are just two of the recent pieces of scholarship that I mention in this introduction, and there are many more such overlaps within the volumes of the encyclopedia.

In fact, many of the major trends in current research encompass holistic media studies approaches. Among these contemporarily salient research projects are network analysis (e.g., Castells, 2009, 2010; Chan, 2007, 2011, forthcoming; Gilbert, Karahalios, & Sandvig, 2010); girl studies (Banet-Weiser, 2011; Durham, 2004; Projansky, 2007a, 2007b, 2010; Valdivia, 2008, 2009, 2011a); transnational feminism (Hegde, 2006; Molina Guzmán, 2010; Valdivia, 2011b); and neoliberalism as an undergirding framework of analysis (Banet-Weiser, 2011; Hay, 2000, 2010, 2011; Hoerl & Kelly, 2010; McCarthy, Pitton, Kim, & Monge, 2009). McCarthy (2011) expands the focus of neoliberalism in media to the educational system and the efforts of many cities, such as Chicago, to become a cosmopolitan, globally vibrant center of economic activity, thus linking media studies to educational policy studies.

Many of these recent research tendencies converge in the critical examination of the "posts." Scholars develop amazing analyses demonstrating the potential of an intersectional approach that uses race, ethnicity, gender, ability, sexuality, and class all at once, for people experience these elements in an integrated manner. Roopali Mukherjee's *The Racial Order of Things* (2006) set the bar for intersectional analysis of the "post-soul" era. Tasker and Negra (2007) provide a comprehensive introduction to the political implications of postfeminist culture, while Molina Guzmán and

Valdivia (2004) apply the intersectional approach to the study of celebrity Latinas. Joseph (2010), in her provocatively entitled “Tyra Banks is Fat!” (a title that, to be fair, comes straight out of tabloid magazines and television coverage), explores the implicit racism and sexism of the postracial and postfeminist veneer of reality television in general, and Tyra Banks’s brand in particular. Molina Guzmán (2010) explores the transnational deployment and commodification of the Latina body, both spectacular and everyday. The politics of the post appears in all elements of media studies as these scholars foreground media studies even as they situate their work within a broader context of geopolitics and the dynamically changing mediascapes. While it may be fashionable to suggest the end of media studies, just as others have previously declared the end of history or of ideology, what this encyclopedia convincingly illustrates is the field’s ability to expand as new practices, technologies, and institutions arise. As many of the editors and contributors will document, “new media” is a misnomer as neither the technology nor the uses or assemblages are so new (see Morley, 2006). What at first may seem to be epochal breaks are revealed by many of the contributors to be far more continuous elements in relation to history, culture, and media.

Editors and Volumes

We begin with normative theories and history. **John Nerone**, author of *Violence Against the Press: Policing the Public Sphere in US History* (1994), co-author, with Kevin Barnhurst, of *The Form of News: A History* (2001), and co-author and editor of *Last Rights: Revisiting Four Theories of the Press* (1995), as well as author of many other journal articles and book chapters, is the perfect historian to lead us through this fertile terrain of scholarship. Volume 1 on history underscores that while all media have long histories, historians agree neither on the definitive tale of origin nor on the particular historical approach. Moreover, Nerone, the careful historian, alerts us to the fact that even our use of the word media in relation to communications is quite recent.

Nerone’s volume includes normative and historical approaches. Both of these overlapping areas of study continue to inform the interdisciplinary, and my singling out of a few representative recent pieces of scholarship below is not meant to be exhaustive, but rather illustrative of the ongoing work. For example, Christians (2010) continues his leadership in the field of media ethics as he strives to expand scholars’ framework from a Western individualist universalism toward a communitarian model that takes into account a broader number of regions and countries. Similarly, Hartley (2007) takes us to China’s *Super Voice Girl*, its version of *American Idol* that is the US version of the British *Pop Idol*, to chart the global expansion of reality television. Plebiscitary industries and the loose equation of reactive entertainment votes with civic participation in a democratic process are issues at the core of contemporary discussions, or rather, popular celebrations, of the democratizing

influence of market-driven free labor from constructed audiences. In particular Hartley singles out China, wherein the political regime continues a very hands-on approach to issues of popular discussions even as media are becoming increasingly commercialized and adapting Western genres. Indeed, the entire deployment of reality television overlaps with discourses of neoliberalism as it shifts responsibility from the state and the collective to the moral labor of individuals (Hay, 2010, 2011; McCarthy et al., 2009; see also Bailey, 2011; Banet-Weiser, 2011), though this is an intrinsically contradictory position in places such as China where the state insists on making decisions, especially regarding media content regulation, even as it shifts moral and economic responsibility to individuals.

Historical research, drawing on normative frameworks or not, continues to offer media studies scholars great insight and tools with which to understand contemporary media. Furthermore, there is great diversity within historical approaches to media studies. At this point studies of memory continue to provide a welcome contribution to the work of media studies. Not surprisingly, Brockus (2004) examines the location of Disney in the US collective cultural memory and national identity. Disney studies is one way of charting US media industries, content, and audiences, especially in terms of media convergence and synergy at a global level. Another topic, special effects, something nearly all Hollywood blockbusters rely on, has received nearly no historical attention from media scholars. To the rescue comes Turnock (2009, 2010), who develops a history of special effects dating back to the production of *Star Wars* and the Industrial Light & Magic (ILM) studio that became the standard for special effects even to this day.

Beyond cultural memory and special effects as components of media history, we are also witnessing an explosion of careful work that revisits the archive, data, and documentation. For instance, Gitelman (2006) takes a fresh approach to the study of history, pointing out that even the archives are already mediated, linking them to the so-called “new” media. While there is much talk about new media, a well-versed media scholar, whose training includes a historical overview, will remember Marvin’s (1988) brilliant admonition that old media were once new, and so will our contemporary media be tomorrow’s old stuff. In addition to Gitelman, Robertson (2009) and Kafka (2009) take us back to technologies that we might not even think of as such, to address issues that are absolutely elemental in the contemporary setting of surveillance, global (im)mobility, and access to and record of any information. Robertson (2009, 2010) instructs us on the pedagogy and deployment of identity technologies, as the passport becomes a document that vouches for our national identity and indeed our very existence. Furthermore, the passport charts the evolution of border crossings, exclusive national belonging, and record keeping of national populations as central tasks of the modern nation-state. Hadlaw (2011) takes a decidedly old school look at early twentieth-century ads for AT&T telephones that literally instructed readers not only how to use the new technology, but also why speed and time had to be reconceptualized as tied to the marketplace, capital accumulation, and surplus value. This careful historical work helps us transition into the production

volume as telephone consumers had to be taught to prioritize elements of daily life that were previously seen as natural and noncommodifiable. Similarly, Kafka (2009) brilliantly studies that most elemental component of media – paper. It seems like such a simple task: how do we study the construction and use of paper, the “bureau” in bureaucratization, the work of scribes? Kafka concludes that: “As scholars continue to research the history of paperwork, we need to keep in mind that we are defending not only the ‘historical record,’ but the political one” (2009, p. 352). Indeed, these are the perfect words to keep in mind as we read the volume on history so elegantly crafted by John Nerone.

Volume 2, *Media Production*, is composed by **Vicki Mayer**. Among the many publications by Mayer, we can list *Below the Line: Producers and Production Studies in the New Television Economy* (2011), *Producing Dreams, Consuming Youth: Mexican Americans and Mass Media* (2003), and *Production Studies: Cultural Studies of Media Industries* (co-edited with M. J. Banks and M. T. Caldwell, 2009). Mayer begins her volume by reminding us that “[M]edia production is frequently the most invisible aspect of our relationships with media. In the storm of media messages we encounter, we rarely consider where they came from, who made them, and how.” We expect to find, and we are not disappointed, a combination of keen attention paid to the sociological approach to our field, something about which McQuail had previously written in *Towards a Sociology of Mass Communications* (1969), and the more critical analysis of neo-Marxist political economy now accompanied by a focus on labor issues in the global setting. Moreover, as explicitly stated in one of her book titles, Mayer paradigmatically maintains a dialogue between political economy and cultural studies, an approach that resonates with globally used approaches in our field. The tension between structure and agency pervades this fine volume. Mayer remarks that “[I]f the focus on social structures has implicated the modern state in the study of media production, the focus on the agency that people exert over media production implicates the modern project to create enlightened subjects who can embody, perform, reflect on, and actually become media producers.” So the new production studies is global by necessity as transnational ownership and production of media industries cannot be denied; blends political economy and cultural studies; foregrounds issues of labor, both above and below the line; and takes up issues of networks, intellectual property, and subjectivity as producers are constructed in terms of categories of identity.

Production is a wide-ranging area of studies. A few examples of the state of the art in production studies follow. Chan takes up the challenge laid down by Castells and many other network scholars, and pursues a couple of case studies in Peru. The first one explores software networks (Chan, 2007) and the latter investigates ceramic production and regimes of intellectual property in relation to efforts to market that traditional craft globally (Chan 2011, forthcoming). Intellectual property is an important component of any discussion of production and global circulation of media or of any form of cultural products, as Boateng (2011) has demonstrated in relation to textile production in Ghana. As both Boateng and Chan have shown, unequal power

between the global North and South have widespread implications in terms of how Western-originated notions of intellectual property are deployed over global regions whose own traditions do not necessarily match individualist and market-driven definitions.

Looking at a very different type of media and group of media consumers and producers, yet resonating with many of the production issues brought out by Boateng and Chan, Banet-Weiser (2011) connects girls' YouTube video productions with neoliberal tendencies of marketing the self within heteronormative, market-driven forms of representation. The labor investment implicit in these forms of digital interventions is also discussed in some chapters of Volume 6 on futures. Additionally, the Banet-Weiser project combines production with representation research, and provides an ideal transition into discussing Volume 3 on content and representation.

Sharon Mazzarella, a prolific scholar of issues of youth and the media, leads us through the wide world of "content and representation." Author or editor of books including *Girl Wide Web 2.0: Revisiting Girls, the Internet, and the Negotiation of Identity* (2010), *20 Questions about Youth and Media* (2007), *Girl Wide Web: Girls, the Internet, and the Negotiation of Identity* (2005), and *Growing Up Girls: Popular Culture and the Construction of Identity* (2001), Mazzarella is a rigorously trained social scientist who also pursues qualitative research. As such she is the ideal editor for this volume, which is respectful of both of those methodological approaches. Indeed, for many a budding media studies scholar, content and representation provide the first point of entry, as these are the aspects of media that we experience most directly. Although, of course, all media have normative implications, histories, and a complex web of production, most people focus on the finished product: the television show, the movie, the blog, the social media website, the song, the newspaper, the advertisement, the catalogue. Content analysis is alluring yet amazingly difficult to carry out. Representational analysis also bears the sophistication of a range of theories. Neither is an easy task, and quantitative approaches complement interpretive studies. Mazzarella presents a persuasive argument as to why content/representational analysis remains an essential component of media studies and why projects that are well carried out tell us much about the world and the circuit of culture.

To be expected, this area of research continues to be plentiful. The few research projects I mention speak to some of the pressing issues discussed in contemporary life, including the ones mentioned earlier, especially girl studies, neoliberal critique, and the politics of the post. A major theme is the neoliberal global regime that contours the parameters for so much of what is discussed in popular media, sometimes discursively enabling a witch-hunt of anyone who dares mention that systemic issues might be at play. For instance, Bailey (2011) examines how actor Isaiah Washington, formerly of *Grey's Anatomy*, is made to pay for his neoliberal *faux pas* when he dared to say that racism was at work in the public incident that constructed him as homophobic. Given the moral economy of neoliberalism, the individual has to assume responsibility for any "sin" and follow a path of therapeutic care of the self.

Washington's assertion that some of the controversy had something to do with racism attempted to shift the analysis to a structural and systemic issue, a move that is not supported within neoliberalism. Thus Washington was coded as the nonrepentant, faulty neoliberal subject. Bailey's representational analysis foregrounds the construction of masculinity vis-à-vis discourses of sexuality and race, and another major area of studies explores the battleground over the construction of the sign of "girls." Chesney-Lind and Irwin (2004) reflect on the moral panic construction of contemporary girlhood, which is constructed as either bad or mean. Neither option provides a progressive possibility for this demographic category. As the ongoing brilliant scholarship of Projansky (2007a, 2007b, 2010) details, girls studies is neither new nor homogeneous, nor does it even refer to an age-specific category as the term "girl" is still loosely used in a sexist culture. Chess (2010) illustrates the gendered deployment of contemporary gaming, including advertising that positions boys/men as producers and girls as consumers, and returns us to the elements of the implicitly heteronormative family. Similarly Lindenfeld (2007), through analysis of representations of food, reveals the articulation of discourses of race and ethnicity to family and nation. Given the explosion of food pornography² now available to us through cable channels, magazines, websites, and within movies (not just Hollywood film), foodways scholars draw our attention to the manner in which food continues to be a primary signifier of identity and belonging.

As useful transitions from content and representation research into audience and interpretation, we consider Hoerl and Kelly (2010), Francombe (2010), and Durham (2004). Exploring the normative elements of the discursive construction of the ideal neoliberal girl who is interpellated into the Wii game "We cheer," Francombe (2010) and Chess (2010) provide a welcome respite from the focus on boys and gaming by studying girls' representations and audience positions in regard to this most popular type of media (see also the extensive work of Nakamura, 2009a, 2009b, 2010, and Volume 6). A follow-up class assignment to these readings, encouraging students to play any Wii game they could access,³ proved to be quite instructive as nearly all games implicitly constructed the player as male. Students took note of the implicit division of labor that this situation generated: boys/men playing digital games and women in their households performing domestic labor around the Thanksgiving holiday.

Similarly, Durham (2004) takes girls' media studies globally and diasporically by studying the relation between media and sexuality in the lives of South Asian immigrant girls. Hoerl and Kelly (2010) take up the postfeminist discourse that is part of the neoliberal regime of representation, wherein we are interpellated into a subjectivity of agency and choice when the latter is constructed *a priori*, already ruling out some of the options for which feminists have fought. In their case study of three very popular Hollywood romantic comedies – *Juno* (2007), *Knocked Up* (2007), and *Waitress* (2007) – Hoerl and Kelly explore the representation of unmarried pregnancy and the resolutions that highlight the do-it-yourself, White spunky women will triumph over all obstacles narrative that ignores issues of power, the economy, and, of course, race and class. Given that the analysis of "We cheer!," media consumed by South Asian

girls, and contemporary Hollywood film segues between representation and interpretation, it provides a useful transition from the former to the latter.

Radhika Parameswaran edits Volume 4 on audience and interpretation. Parameswaran's research includes two long articles in *Journalism and Communication Monographs*, "Melanin on the Margins: Advertising and the Cultural Politics of Fair/Light/White Beauty in India" (2009, co-authored with K. Cardoza) and "Global Media Events in India: Contests Over Beauty, Gender, and Nation" (2001). Her work has focused on the intersection of feminist cultural studies, gender and media globalization, South Asia, and postcolonial studies with a particular emphasis on issues of audience and interpretation. As such she constructs a volume worthy of her areas of expertise, with plenty of chapters illustrating global and gender issues. This volume also bears the traces of an interdisciplinary field that includes social scientific paradigms such as uses and gratifications as well as more humanist approaches that now include global and online ethnographies. Parameswaran remarks that "audience studies has not only survived the backlash against its populist tendencies in the late 1980s to mid-1990s, but it has also thrived and expanded to include a range of audiences, media genres, modes of audience engagement, and institutional and international sites of reception." "Populist tendencies" refers to the "discovery" of the audience around every corner, as it were, without proper attention to issues of power and structure. In the contemporary moment, audience studies is vibrant and innovative. Whether we look at fans or online digital communities, to mention just two of the many possibilities, the construction and potential agency of the audience are major issues that continue to guide the production of media and subjectivities. Illustrative of the many philosophical quandaries undergirding the location of the audience within media studies is Jack Bratich's chapter in Volume 6, as audience analysis is part of the present and future of the field. In addition, audience connects with issues of production as it undeniably takes labor to be part of any audience.

Illustrating one of the many possibilities within audience studies, Buchmann, Moore, and Fisher (2010) take up the issue of Hollywood film-induced tourism. Their case study examines the Tolkien trilogy (*The Lord of the Rings* movies that were filmed in New Zealand) and the tourism to that location that the movies have generated. This is a project that can fit in both audience and effect, for how can one argue that traveling to a real faraway country – as New Zealand is from the United States – for a very hefty sum of money to attempt to relive the books and the movies that feature a fantastic story is not a very strong and immediate effect partly induced by particular forms of very persuasive media? Given that tourism composes a growing percentage of many countries' GDP and that much of it is induced through mass media, it is not surprising that a journal such as the *Annals of Tourism Research* includes articles that could squarely fit within a media studies journal, including this one on film-induced tourism.

Erica Scharrer guides us through the fifth core component of media studies, media effects and media psychology, the dominant paradigm in the United States as well as in other global settings such as the Netherlands, and the paradigm that reaps

the most funding in a positivist framework that values scientific demonstration of impact. Scharrer has co-authored, with G. Comstock, *Television: What's On, Who's Watching, and What it Means* (1999), *The Psychology of Media and Politics* (2005), and *Media and the American Child* (2007), and, with L. Weidman and K. Bissell, a long article in *Journalism and Communication Monographs*, "Pointing the Finger of Blame: News Media Coverage of Popular-Culture Culpability" (2003). Scharrer brings to the volume on media effects/media psychology a long-standing engagement with the social scientific paradigm in our field. A well-carried-out effects study tells us much about the influence of media on individuals, groups, and societies. The field of media effects, therefore, is presented with both the challenge and the opportunity to sort out these complex and potentially idiosyncratic experiences in a context in which the number of media outlets has proliferated, their use occurs at virtually any location and time of day, and their consumption and purposes intersect and converge more than ever before. Thus Scharrer asks: "Why are individuals drawn to media to such impressive degrees? How do they process and make meaning from media messages? What types of content are they both receiving and creating when spending time with media? What are the consequences of such media use? What factors and conditions help explain why individuals vary in their responses to media? And what factors and conditions may moderate or mediate such responses?" These questions require complex methodological and theoretical expertise to answer. Many of us were schooled in a critique of the "hypodermic needle" model, though we have since learned that the media sometimes have or generate direct effects. Why else does a multibillion dollar advertising industry exist in the United States? However, we continue to marvel at the long-term cumulative effects that are far more complex than we originally anticipated. Furthermore, effects scholars, such as many of those contributing to Scharrer's volume, seek to explore how to effect positive change as well as how to avert more nefarious outcomes.

Finally for now,⁴ the encyclopedia concludes with Volume 6 on "media studies futures" edited by **Kelly Gates**. Gates's own research is the veritable embodiment of a focus on futures. Author of *Our Biometric Future: Facial Recognition Technology and the Culture of Surveillance* (2011) as well as co-editor with Shoshana Magnet of *The New Media of Surveillance* (2009), Gates studies the discursive formation of the wishful deployment of recognition technology with an "almost gleeful futurism" that suggests "if only" the systems were in place, before 9/11, for instance, our present and future would be different, better, and so on.⁵ Futures is, by definition, a transient category, as within 10 years the content of this volume will be the stuff of the present, or maybe even the recent past. As Raymond Williams has written, we cannot anticipate what will be an emergent media form until it is *post facto*. The futures volume takes up some of the issues around Internet, gaming, social media, mobile telephone in a converged media form, biopolitics, and digitalization technologies such as biometric body scans. Gates asserts that media studies needs to take seriously the possibility that *radical uncertainty and contingency* are the only features that define where media are and where they are headed. All of the chapters in this

volume could be retrofitted into the other five volumes. Yet together they compose a vision of the field as it moves forward, taking up issues that date back centuries, engaging them with theories and modes of media that only apparently represent new terrain.

Emblematic of the future of media studies research, in her ongoing and not just influential but paradigm-shifting body of work, Nakamura reveals the fallacy behind claims that the Internet and digital gaming left behind the body and its racialized, gendered, and ability components (Nakamura, 2009a, 2009b, 2010). Nakamura takes us into the world of digital media and the many types of labor that they absorb – from our racialized player labor to the labor that it takes to produce the virtual and material gaming infrastructure. While gaming is not new, the ways that it becomes its own subfield due to the sheer magnitude of the industry, its widespread everyday deployment, and the millions of people daily engaged in its production and consumption, make it a focal point of our field. Similarly, Meddaugh (2010) highlights the relevance of new forms of delivering news to an audience that no longer watches traditional media or reads legacy media. Comedians such as Jon Stewart and Stephen Colbert replace the prime-time news of yesterday as a source of information, and deliver their message through alternative cultural genres such as humor to get at a deeper truth than the “objective” news. Also a new twist on an old tactic, in a hyper-capitalist age, it seems almost impossible to imagine a space or time when not everything is bought and sold in the transnational marketplace. Boycotts seem so last century to our students. Buycotts (Pezzulo, 2011), on the other hand, provide consumers with a positive tactic – to buy products that confirm consumers’ demands. This strategy works within the system to secure gains such as environmental practices. Environmental and green issues come up often in Volume 6 as many of the contributors, especially Maxwell and Miller, remind us of the massive amounts of disposable hardware, not to mention the huge carbon footprint, it takes to produce the so-called “new media” that many of us are constantly buying to replace the previous disposable model.

Jessica Retis-Rivas’s (2011) work on flows of immigrant media from Latin America via Spain and Europe to the United States complements the work on contraflows by international communications scholars highlighted by Daya Kishan Thussu (2006) in his overview of the field. For example, the work of news flows then is taken in the field of international communications as “contraflow” – the fact that the one-way flow from the West to the rest sometimes backs up and is thrown right back at the empire. Today the ongoing work by Jessica Retis-Rivas tracks the flow of Latina/os and Latina/o media as populations move around the globe in reaction to economic crises. Thus she charts the original flow from countries like Peru or Colombia to Spain as Latin American economies tanked. In Spain the economy is now in rapid decline and the political situation quickly veering to the right – with the election of conservative Rajoy replacing the left-of-center Zapatero indicative of the popular frustration with a global crisis that cannot be contained at a national level. Latina/o populations, many of whom have gained Spanish citizenship, are flowing once more

to England in general and London in particular, and many more are planning yet another trans-Atlantic crossing to the United States where they will enter as European/Spanish immigrants. They bring with them their media businesses and practices. The contraflow that was originally discussed in terms of media is now embodied by globally roaming populations, who of course take their media and culture with them and continue the millennial hybridization of both.

This is the state of the art of media studies. It is a field where we know better than to use the term “new” media – for all media are somewhat new but also very old in many of their aspects. Scholars in this encyclopedia take us back to the production of paper even as they bring us up to the latest technologies, assemblages, and institutions that arise to mediate our world. Contributors to this encyclopedia share the belief not only that media studies is an academic exercise, but also that by engaging in this important area of studies we are somehow contributing to a more just vision of the world. As the separate volumes build on each other, whether we are engaged in media at any of their analytical nodes (production, content and representation, audience and interpretation, media effects/media psychology), we are simultaneously linked to its history and its future. As a diverse heterogeneous field that is global, interdisciplinary, intersectional, multi-methodological, I cannot imagine a more exciting and potentially liberatory academic enterprise to be involved with.

NOTES

- 1 In this introduction and whenever possible, this encyclopedia uses “America” to refer to a continent and “US” or “United States” to refer to the country, unless we are quoting from scholarship that uses “America” otherwise.
- 2 Food pornography refers to the deployment of codes of pornography – such as repetition, extreme closeups, and lingering camera shots – in the coverage of food and food preparation in so much of today’s multichannel media.
- 3 Students often have gaming equipment in their place of residence. If not, both libraries and athletic facilities on campus have entire rooms dedicated to gaming as well as providing an opportunity to check out gaming equipment.
- 4 A *Methods* volume is projected to be released at a later date, edited by Fabienne Darling-Wolf.
- 5 Few people know that Gates submitted her dissertation proposal the day before 9/11. What to the committee seemed like futuristic queries became the very real present within a period of 24 hours.

Left Behind

End Times for a Media History Paradigm

Carolyn Marvin

ABSTRACT

This chapter examines the work of the media “structuralists” of the so-called Canadian or Toronto school of media studies: Harold Adams Innis, Marshall McLuhan, and Walter J. Ong, especially. Their work is placed within its historical context, both in terms of scholarly ancestry and in terms of its reception in North American universities and especially in schools of journalism. A critical assessment of the work of these scholars as media history is offered, recognizing its shortcomings as historical narrative but also its appeal as a way of understanding the influence of media forms.

What makes us who we are? Class struggle? The disenchantment of the world? Do we owe our ways of being in the world to the family romance, the wheeling zodiac? How about the selfish gene, birth order, guns, germs and steel, patriarchy, the internal combustion engine, original sin, the scientific method? Is it the particular way that media technologies frame the social environment and organize our relationships to one another? Anyone inclined toward this last idea will recall a line of argument from the 1960s Marshall McLuhan for a while hijacked what might be called thinking popular culture with a high-concept take on the generational explosion of the 1960s – its energy, its music, its civil rights, its sexual openness, its advertising, its counter-culture, its antiwar volume.

The ore McLuhan proposed to mine to uncover society's deep structure was television, rabbit ears cocked to the cultural sun and overdue for a vision more arresting and certainly more entertaining than the wasteland talk of establishment discourse. Behind television's ephemeral, culture-clucking content, McLuhan discerned a perceptual world in transition to sensuous plenitude. He argued that mental habits deformed and impoverished by the phonetic alphabet and typography were in an expansive process of reconnecting to an electric shared cornucopia of bodily sensation, especially the acoustic sense (McLuhan, 1964). While popularly admired as a possible master key to the cultural id or, at the very least, a provocative commentary on postwar society, the powerful message McLuhan assigned to the medium also had a scholarly life, primarily as the stalking horse for a paradigm I describe here as media structuralism. Though McLuhan was its public face, it was elaborated and developed by an interdisciplinary group of twentieth-century scholars collectively persuaded that the historical appearance of alphabetic inscription, especially its printed form, was a phase change in human civilization. Generally speaking, they agreed on the rough outlines of that change.

This essay is a critical examination, here and there a ferociously critical examination, of the intellectual usefulness of that paradigm for representing the history of media. Media structuralism took the history of inscription as a seed model for understanding the cultural impact of twentieth-century electronic media, especially television. Though inscription in all its forms was always implicated in the logic of media structuralism, alphabetic inscription in particular was examined as an instrument that, in rendering language abstract and detached from direct human encounter, had set human society down a historical path of no return.

The engine of the argument was the hoary old notion of technological determinism, a clumsy moniker for what turned out to be an equally clumsy claim. Everywhere the alphabet went, in this narrative, an irresistible logic of form went as well. Alphabetic literacy as a cultural formation was said to have restructured authority and trust, public and ceremonial life, the social and cultural organization of knowledge, forms of collective representation – even, in some versions, personality and perception. Its effect was not only on the forms of collective life, but the shape of the social values these forms were said to embody. For communication studies, media structuralism offered something else as well: an attractive apparatus of grand distinctions for fashioning a disciplinary imperative.

In media structuralism alphabetic inscription was ground zero for looking backwards at the past and forward to the future. It offered a way to frame a collection of troubling discontents associated with modernity, and experienced as anxiety about the attenuation of grounded spatial experience, the inscrutability of technocratic systems of knowledge and power, the incoherence of a diffuse public sphere of imagination, the felt loss of shared moral sensibilities, and an uneasiness that immediate objects and distant demands were too insistent and evolving too quickly for the world to be a comfortable human place. Media structuralists differed among themselves about the degree to which different inscriptive forms had moved this process

forward, and the exact processes by which literate effects were translated into the lived particulars of past and present existence. They agreed that whatever these transformative mechanisms were, they were both cumulative and accelerating. In pursuit of their convictions, these disagreements were more ignored than addressed, often in the expectation that deeper scholarship would sort them out in time. Meanwhile, visionaries could grasp the essential historical pattern.

The most influential twentieth-century structuralists did not work under the institutional aegis of communication, a postwar academic invention constructed from a patchwork of intellectual and practical interests traditionally divided between speech communication and journalism instruction. The postwar period saw the gradual assimilation by communications programs of questions about journalism and media addressed from the perspectives of social science. This was mass communication effects research, which soon began to assert itself as a powerful disciplinary paradigm. Recent work chronicles the origin of that tradition in the migration of World War II psychological warfare research and the networks of social scientists developed around it. The new approach was policy oriented, statistically savvy, and staffed by social scientists with the quantitative and organizational skills to secure funding and academic prestige. It entered a postwar educational landscape where major US universities competed for generous funding from a government that valued scientific expertise as an engine of measureable social progress (Haney, 2008).

The imparting of craft knowledge of journalism had no grounding in systematic research. It responded more to professional press associations than invisible colleges of scholars (Carey, 2000). From the beginning, the trainers of journalists and the social scientists did not fit very comfortably together. Though both were focused on media, the uneasiness of their coexistence has been noted, if not much explored. Meanwhile, communication and journalism programs were swept up in the postwar higher education project of constructing more rigorous academic standards across all disciplines, standardizing the curriculum and promoting their field in the wider public sphere. In the absence of long-standing theoretical or methodological traditions with which to leverage funding or prestige, mid-century journalism programs seemed unable to formulate a disciplinary image legible to the larger research university (Carey, 1978). The rhetoric they chose to defend themselves was proffered largely in civic and moral terms. Its message was that good journalists are key to producing an informed citizenry capable of shaping a wider public sphere. Journalism faculty with more academic ambitions positioned themselves as ethical arbiters, critics and moderators of a public debate among citizens, press, and government. Meanwhile, the mantra of journalism instruction – the impossibility of democracy without newspapers – was overshadowed by television in the popular imaginary, and in the imagination of students. With its unapologetic glitz, mid-century's most popular mass medium seemed to have little in common with the heroic world of journalistic ideals that were the heart of journalistic self-presentation in the academy.

At this moment of professional vulnerability, media structuralism offered some humanities-oriented communication and journalism scholars a distinctive set of

questions and a clear object of inquiry. The attribution of powerful inscriptive effects to whole cultures across the sweep of human history seemed to challenge the media effects tradition at its very own game. More subtly, media structuralism offered a moral framework. It laid out a broken world that legitimated disciplinary anxieties in the academic workplace by linking them to a more encompassing cultural narrative. In the academy's growing embrace of theoretical abstraction and scientific specialism, some communications and journalism faculty discerned an abandonment of that institution's vital responsibility to foster dialogue and debate about the great moral questions concerning the civic and academic realities that had come to pass in the postwar moment. It also explained why journalism faculty had not been welcomed as equal participants to the academic table. In these circles the narrative of literate deformation was received both as a well-timed commentary on political tensions within the academy, and as a place from which to reflect on the increasing takeover of the larger culture by the market and the state. Problematically, it failed to offer what its followers needed most. It did not provide a vision of institutional expertise, a methodologically coherent research strategy for training students, or a topical research agenda that could stabilize and consolidate the position of those communication scholars who were not part of the tradition of media effects.

McLuhan had none of this in mind when he laid out the mechanism of television as a perverse kind of modernism in which function followed form. Form was the pixelated screen. Function was the perceptual experience it assembled. McLuhan's pseudo-mathematical "ratio of the senses," a kind of updated medieval system of bodily humors, was meant to reveal a once seamlessly integrated human sensorium that had been fractured by alphabetic literacy and printing (McLuhan, 1962). What print had torn asunder, television would reconnect. The television screen was far more than an agent of shallowness and distraction. It presaged the repair of the psychic dissolution that had long burdened industrial man. This coming transformation was discernible in the new electronic technologies of knowledge and experience. A globally dispersed shared consciousness needed only to recognize itself to claim its utopian reward: unity instead of alienation, simultaneity instead of fragmentation.

Though the spectacle of an erudite literature professor ceding the future of culture to television, the medium of the commonplace and anti-intellectual, was thrilling, McLuhan's koan-like, aphoristic disdain for the conventional apparatus of scholarship denied him a serious academic hearing. A few weak efforts by supporters to translate his claims into something like identifiable social science hypotheses came to nothing. The culture moved on. Still, where technology had once seemed opaque and irrelevant, a side story to larger dramas of politics and society, McLuhan made it problematic, revelatory, and playful. His environmental conviction that everything in culture is a medium in disguise that lends itself to communicative theorizing hung on. He installed the idea that media do not end with their surfaces but resonate and connect with deeper cultural structures. Most of all, he succeeded in linking the profane order of technology to a powerful, even mystical, sense of cultural illumination. He remained an animating presence at the University of Toronto, which holds

his papers. His ideas were also significant in the work of the media ecology program at New York University originated by Neil Postman. Elsewhere his influence was manifest at the Institute of Communications Research at the University of Illinois at Urbana Champaign in the work of James W. Carey (1967, 1998), who paid less attention to McLuhan himself than to the claims of the media structuralists on whose ideas he had built.

The High Modernism of Alphabetic Literacy: Walter J. Ong

One of the driving premises of the cultural analysis of modern media is the idea that there is a relationship between forms of media and forms of life. This formulation had no disciplinary identity in US universities before McLuhan. While his ideas were synthesized from an eclectic mix of influences, the strand that is relevant here was his quixotic refashioning of work by a loosely connected group of anthropologists, linguists, classicists, and one political economist. Several of these scholars had published in the 1920s and 1930s. Most were contemporaries of McLuhan himself. Like him, several were at different times in residence at the University of Toronto. A fair number were Catholic. Though variably aware of one another's work in the 1960s and 1970s, they were less a self-identified research community than attached to a common object of inquiry, namely, the history-altering effects of alphabetic writing on human society. They embraced the view, contrarian for the time, that literate achievement was not an unqualified intellectual advance. A few believed that the price of alphabetic literacy had been a profound loss of cultural innocence. Working from various sources of evidence, they offered idiosyncratic and sometimes controversial readings of the historical record, and observations of isolated tribal and rural communities conceived as placeholders for earlier stages of civilizational development.

The work of Albert B. Lord and Milman Parry on the oral-formulaic techniques of Serbo-Croatian singers was foundational to their shared enterprise (Lord, 1960). Eric Havelock (1963, 1981) advanced a disputed thesis that the *Iliad* was the frozen snapshot of an apparatus of classical oral memory captured at the moment when the alphabet's unique power (the linguistic wisdom of the time) to transcribe spoken language had revolutionized intellectual storage. Jack Goody and Ian Watt at Cambridge energetically challenged the crude binary classification that divided men into savage or civilized, arguing that these categories misunderstood what forms of social organization were necessary to literate and non-literate societies (Goody & Watt, 1968; Goody, 1977).

On the basis of their own studies of inscriptive technologies and the social practices connected to them, two in this group made broad claims that the impact of alphabetic writing had large-scale diffuse effects that were discoverable, universal,

and profoundly problematic. They were Walter J. Ong, SJ, a onetime student of McLuhan's at St. Louis University, and Harold Adams Innis, McLuhan's older colleague at the University of Toronto. Ong discerned these effects in a somewhat manichean struggle between the ear and the eye for sensory dominance (Ong, 1967, 1979). For him the structure of consciousness flowed from repeated encounters with messages available to each perceptual sense. Though the historical ear captured human communication in the form it was meant to be, the historical eye was overwhelmed by corrupted messages that swamped the natural faculty of the ear. Innis argued that the physical properties of messages themselves, rather than the sensory modalities that captured them, were reflected in the mechanisms of societal stability and control. The struggle he discerned was between bureaucratic expansion fostered by messages that could move efficiently across space without distortion, and spiritual traditions of memory in which messages could persist across time with little distortion (Innis, 1991, 2007; for a useful retrospective consideration of Innis's work, see Acland & Buxton, 1999).

For both Ong and Innis, what appeared to be an analysis of the empirical conditions of communication became an unproveable claim that a fundamental moral tendency was associated with different technological forms. Each employed a wholly modernist impulse to strip down human experience to what he perceived as its essential properties. Each also embraced a surprisingly anachronistic framing device: the old culture-stage theory of civilizations, even then a discredited tradition for asserting radical and universalized shifts in human affairs over time. The arguments of both theorists shared three anchoring postulates: (1) At any given historical moment, a "dominant" medium controls the moral, intellectual, and social character of the society in which it exists. (2) The origin of a proper kind of human morality lies in acoustic speech. So does the possibility of its renewal. (3) Acoustic speech is weak against alphabetic writing (and its handmaiden, electronic media).

That writing dominates speech was so obvious to Ong as to need no serious demonstration of its validity as a fact. He repeatedly argued that the habits of acoustic speech were no match for the sheer plenitude and irresistible power of written language. On the plenitude side, writing was said simply to have crowded out meaningful speech and taken up social real estate previously occupied by talk. He might have sought to establish clinching, systematic evidence in the experience of contemporary man – the most accessible and presumably unambiguous example of this historical dynamic at work. In fact, this would not have been easy evidence to assemble. Would one compare time occupied with written media to time spent in conversation? Would a better measure be the number of words individually channeled through each medium, whatever the time spent? Should one consider the social importance of messages in each mode? How to make sense of striking differences in literate and conversational practices across social groups? Which groups? Might individual measures be the wrong ones? Should the focus be on institutional communication? Which institutions? Above all, how could one disentangle the lived reality that writing is thoroughly intertwined with talk, and always has been? To

draw only the most obvious conclusion, people engage in more talk because they read and write, and read and write more because they talk.

Alternatively, Ong argued that the brute psychological power of written language colonizes and transforms the fragile spirit of spoken language, whatever its plenitude might be. This is the idea, approximately, that speech in societies dominated by writing isn't the true, natural speech of original face-to-face encounter. Ong offers many anecdotal examples. They include dictionary-referenced educated speech that in time renders socially inferior the dialect of the neighborhood. The emblematic modern oral speaker is a broadcaster or politician who works from a script. Novelistic dialogue is an artificial facsimile of natural speech. The inevitable logic of his argument is to reduce all contemporary spoken language to a degraded simulation of authentic conversation. Even speech learned at a literate mother's knee cannot be orally pristine when spoken language is demoted to a pale echo of writing. Ong skirts the implication of his argument and also does not refute it.

The justificatory theology of Ong's framework sheds some light on its structure. In *The Presence of the Word* (1967) he argues that men at the origin of human history communicated freely with God. This archetypal encounter created a foundational model for men's relationships to one another. The spiritual necessity of voice and presence was, teleologically speaking, the final cause of the evolution of speech. Writing imposed a disabling artificiality on what men were evolutionarily destined to be. The Fall was effectively a historical event in which inscription shattered the world and estranged men from God. Language that naturally exists in a dialogical condition of acoustical fullness was abstracted and placed on the page. It became a lifeless object separable from the human beings who generated and perceived it. Thus was set in motion a cascade of ever more inventive ways for men to separate themselves from one another while concealing from themselves what they had done. In Ong's view the inscriptive abstraction that fractured the core of human encounter still lies at the beating heart of media, insidiously working against the healing and communion of loving mutuality that a broken world requires. If the spatial abstraction of language by alphabetic inscription so irrevocably split apart something in human consciousness, exactly when did it take hold? Ong never names the decisive moment of psychological transformation after which men became hobbled in their understanding of their essential humanity. Here we pause for emphasis. If the psychological shift away from the wholeness of experience cannot be anchored with historical specificity, if such a moment cannot be unambiguously located for any particular group of people, perhaps the psychological consequences of literacy are neither definitive nor universal but utterly ambiguous, various, and contradictory for all human persons, individually and collectively – much like all human experience.

Ong's most thorough attempt to demonstrate empirically how alphabetic literacy has shaped the structure of human knowledge appears in *Ramus: Method and the Decay of Dialogue* (1983). Based on his doctoral dissertation, it is a study of a pedagogical method invented and popularized by the sixteenth-century French rhetorician and educational reformer, Peter Ramus. Ong explores the Ramist strategy of

visualizing knowledge as a discrete object in space to be efficiently compartmentalized, dissected, juxtaposed, and compared to similar discrete objects. This simplification and flattening out of the learned tradition repudiates a person-centered epistemology of rhetorically layered and sifted judgment. Ong finds evidence in Ramism of an underlying psychological shift away from the traditional acoustic sensibility of the rhetorical art with its appreciation of the dramatic, the creative, and the poetic, and toward the cultivation of new mental habits associated with the monologic, the diagrammatic, and the quantifiable. Ong also argues that the visual cast of the Ramian prose style reflects the psychological experience of a learned man of his day. In this Ong may have been a victim of the fallacy he attributes to literate man. He is perhaps too ready to take what is on the page for a complete reality.

It wasn't just the moral force of language that was weakened by alphabetic literacy in Ong's view. He argued that the triumph of the visual over the acoustic affects human perception of even the phenomenal world. He contrasts the imagined psychological integrity of pre-literate aural experience with the fragmented perception of the post-literate world. He frames this distinction with a physiological proof. In his acoustic cosmology, sound bathed pre-literate hearers non-directionally. Men felt themselves to be immersed in the womb of the world (Ong, 1979). This is a peculiar basis on which to claim distinctions in historical states of human experience. It is hard to believe that any living person exists in a world that is not phenomenologically perceived as immersive. An acute perception of aural directionality is also a vital mode of perceptual discrimination at least some of the time for everyone, and not only for modern navigators of urban streets. Skilled hunter-gatherers would have depended heavily on it. The point of Ong's contrast is to argue that visual experience puts viewers at a perceptual and, therefore, psychological distance from what they behold. This claim must puzzle anyone who has ever been lost in the face of the beloved, or utterly absorbed in a stunningly beautiful landscape, a traumatic scene, a good book.

Pre-literate hearing man was seeing man as well. Some fancy footwork is necessary, then, to explain away the obvious delight in visual experience we may attribute to the creators of the skilled and beautiful designs of material artifacts left to us from ancient and traditional cultures. Acute vision must always have been critical both to the survival and the aesthetic pleasures of the human species. Though different perceptual skills may be honed for the needs of different historical times and places, there are no grounds to believe that hearing was the premier perceptual sense of people in settlements without writing (or that it makes any sense to compare the modalities of ear and eye hierarchically). It is obvious that the visual objects men attend to vary by time and place, but Ong's claim that the most typical visual experience of literate worlds is inscriptive is difficult to credit.

If alphabetic literacy dominates modern visual experience, and modern visual experience dominates all other sensory modalities, then it must dominate touch itself, which accompanies our ever-present situatedness in the world. Ong contrasts what he believes is the relatively more impoverished visual experience of alphabetic

cultures with the presumed perceptual richness of pre-literate existence. Did he mean there is less visual variety in modern life, or that we ignore extant visual variety in order to read? Did he find cities to be less visually variegated than natural landscapes? Here the point at issue cannot be writing as such. It is a claim about the poverty of even the most elaborate human artifactual creations stacked up against nature's fecundity. If human worlds are full to the brim with visual experience in all historical conditions, what can it mean for the ratio of the senses to shift historically? For the perceptual "load" to be different from one culture to another? What is the proper ratio of sensory experience for human beings? What best suits the forest? The savannah? The tundra?

And yet Ong also allows that writing has been necessary to the full development of human consciousness. This concession seems to give the game away. If evolutionary orality may flourish only at the cost of intellectual development, it can hardly be a totalizing ideal for communication among men living in time. In light of this admission, Ong (1982) undertakes to reframe his analytical goal as simply laying out the affordances and tendencies of the range of available communicative modes. Just as there is a natural balance of the senses, he proposes the possibility of a cultural balance between writing and speech. It is hard to imagine what this might be, given his previous arguments. It is curious that while writing has been able to historically amplify and elaborate its power, speech has lacked this capacity. It is more threatened than ever by what he labels the secondary orality of electronic media with its deceptive illusion of intimacy and dependence on literate technology to exist at all. Since speech remains impotent, literate psychology remains unredeemed.

Particularly problematic is Ong's claim that some groups living among literates in the twentieth century have maintained living contact with pristine orality. To explain the persistent failure of minority students in the United States to achieve parity in educational achievement with their majority-group peers, Ong (1979) invokes the "highly oral culture of our black urban ghettos" (p. 4). He diagnoses an educational disparity as a clash of "residual" orality with the literate world of schooling. More than a century after the end of the slave trade, he seems to propose that African Americans are psychologically wedded to the tribal orality of their ancestors, impervious to the contemporary literate blanket surrounding them. Leaving aside the faulty assumption of a unified "African" oral tradition, and the failure to account for this striking survival of this oral sensibility in spite of the disappearance of so many other features of a pre-literate African heritage, the underlying point is worth our notice. There are pockets of escape from literacy after all. "Nor is orality ever completely eradicable; reading a text oralizes it" (Ong, 1982). If print is oralizeable, what possible grounds are left for driving a psychological wedge between writing and speech?

Indeed, Ong never seriously addressed how the orally pristine might sustain themselves, or how contemporary communities might develop their own oral traditions in a larger typographic milieu. The point allows us to consider how literacy itself is diffused. Must literate skill be individually acquired to work its

consciousness-transforming effects? Is living in a world of literate conventions – time stamps and train schedules, driver’s licenses, tax forms and street signs – enough to inculcate a so-called literate psychology? Is literate-mindedness, whatever this may be, wholly transmitted by social imitation and not at all by the visual abstractions of language and sensory specialization? Does the achievement of cultural literate-mindedness require the attainment of reading and writing skills by some critical mass of the population? Do adults with poor literacy skills really have habits of thinking that differ fundamentally from those of their literate fellows? Or do they lack access to specific social networks and timely information?

The End of the Great Divide

To summarize: The text of Ongian structuralism is a mechanism that evacuates from spoken language an acoustically conveyed morality that is the essence of spoken language. This loss of dialogic mutuality estranges literates from the phenomenal world and other men. We may think of this brief statement as the kernel of the tragic narrative of the so-called Great Divide hypothesis. Once prevalent in educational and cognitive psychology circles, the Great Divide proposes in its most basic form that literacy is the signal cognitive acquisition that makes higher-order abstract thought possible. In addition to the tragic vision of media structuralism, there is an ameliorative version of the Great Divide as well. Literacy acquisition is the condition of sophisticated technological progress, and the essential tool of an informed democracy.

To assess the root claim of the claim that literacy is an essential prerequisite for abstract thought, the social psychologists Sylvia Scribner and David Cole (1981) undertook a seven-year ethnographic and experimental study of literates and non-literates in a small area of Liberia in the 1970s. They chose their field site for the fortuitous fact that three different scripts were locally taught using distinctive pedagogies. Arabic script was the medium of instruction in Qur’anic schools. Romanized script was taught in English schools. A locally invented Vai script was taught informally by some adults to other adults. Most students typically learned only one kind of script. This meant that Scribner and Cole were able to measure and compare the cognitive skills of each group of script literates. They also measured the cognitive skills of literates and non-literates across a range of cognitive domains. These included abstract thinking, taxonomic categorization, memory, logical reasoning, and reflective knowledge about language. These data were supplemented by ethnographic observation and extended surveys of family and occupational histories, and of attitudes associated with modernity. Unglamorously but importantly, they learned that different styles of literate instruction cultivate different cognitive skills. The tasks that students excelled at were exactly the cognitive tasks they were trained for. These cognitive tasks were related to the practical functions each kind of script performed

in Vai society. There was also no Great Divide. That is, there were no statistically significant differences in the capacities of literates and non-literates to succeed at abstract thinking tasks. The belief that oral man is captured within a shell of concreteness he cannot peck his way out of to some higher-order level of thinking was heartily disproved.

There was one weak effect that is richly ironic in this context. Literates were a little better than non-literates at *talking* about the structure of language and literacy. In addition, schooled English literacy affected some social relationships among its practitioners, in ways that schooled Qur'anic and non-schooled Vai literacy did not, by offering access to bodies of knowledge outside those locally circulated. This was so even though the amount of time all groups had spent in urban areas was not significantly different. Since girls did not attend school, gender was the single attribute, decidedly a non-cognitive one, reliably associated with the possession of literate skill. The point was that the sources of intellectual achievement are found in cultural and social circumstances, and not in cognitive capacities transformatively tied to literacy acquisition. So where are we? If it is the case that shifts in communication technology do not kick new psychological processes into gear through a process of inculcating literate-mindedness, perhaps these technologies steer social processes in powerful ways. This was the argument Harold A. Innis developed, and to whose work we now turn.

Media Structuralism in its Laocoön (Mannerist) Phase: Innis

Commenting on Innis's account of communication technology as a shaping force in human history for a special issue of the *Journal of Canadian Studies*, his biographer A. John Watson (1977) points to an iconicized, technologically determinist Innis (pp. 45–46). This was the Innis whose bold theoretical claims about societal character anchored in the physical properties of message decay made him a key figure within a certain strain of media studies. This media structuralist Innis is often contrasted with a second persona. This was the political economist whose scholarship about the Canadian fur trade and cod fisheries produced a much admired theory of economic relations between metropole and hinterland. The iconicized, structuralist Innis had a more sweeping point of view. He laid out a world-scale drama of technological contenders in a continuing confrontation between the spiritual tenacity of inward-looking religious tradition and the present-mindedness of secular expansion across territory. He pitted the comparatively effortless movement of messages across distance by media like paper, papyrus, and radio against less mobile forms like parchment, stone, and oral tradition. He believed their durability made them rich in their power to conserve memory. (A small point: Parchment is sturdier than paper, but not much heavier to move. Nomadic oral cultures traveling across space were hardly

unusual. Countless pre-literate groups that stayed put proved rather more fragile than Innis's schema suggests.)

It would be reassuring to conclude that the formulized Innis sketched above was a caricature of the real thing, but it is hard to do with much conviction. *Empire and Communications* (2007) and *The Bias of Communication* (1991) together present the basic framework. In them, Innis wraps up Western history and a little more in less than 300 pages. *Empire* starts with early writing and proceeds through Egypt, Greece, Rome, medieval Europe, Islam, and the printing press. *Bias* repeats parts of that narrative and lays out nineteenth- and twentieth-century Anglophone publishing with a glancing take on radio and telegraphy. In so compressed an itinerary, even Innis's most sympathetic readers have little to fall back on but the highly abstract engine of space-time oscillation in which "biases" toward present-mindedness or tradition-mindedness swing back and forth in history. These arise from the physical portability or durability of whatever media instantiate and so "dominate" a given society's prevailing systems of knowledge and authority. Sooner or later a challenger with the contrary bias rises up and displaces its dominant predecessor in processes that Innis never deeply details. He created no conceptual architecture at all to mediate between his abstract matrix and the slightly mad chronicle of unsorted facts he offered to shore it up. A series of breathless historical assertions and propositions unrolls in the texts of *Empire* and *Bias*, their connecting inferences frequently incomplete or elided. Their author disposes of vast time scales in a few sentences. Great clumps of political and historical complexity are rendered in abbreviated narratives with little discussion. He is contradictory. His inattention to underlying social processes makes it difficult to follow, much less evaluate, his conclusions. In the absence of a conceptual language to order his staccato breviary of fact, his claims are at once too abstract and too particular. His work offers none of the rich expansiveness of articulation that is fundamental to historical explanation. This is probably why both books were scarcely reviewed in economic and history journals at publication and received only a handful of notices in political economy journals, even in Canada where Innis remains an intellectual national hero.

The opacity of Innis's prose is legendary. It is hard to pick an excerpt that illustrates this in a short space; the following sample may suffice. It references the United States during the Great Depression, a topic that most readers will find more familiar than the ancient civilizations that mostly occupied his concern. Its relative abundance of detail is atypical since Innis was wont to summarize the character of whole societies in a phrase. Of the 1930s United States he writes:

The highly sensitive economy built up in relation to newsprint and its monopoly position in relation to advertising hastened an emphasis on a new medium, notably the radio, which in turn contributed to a large-scale depression. The radio was accompanied by political change in the return of the Democratic party to power and the election of F. D. Roosevelt who claimed that "nothing would help him more than to have the newspapers against him." Localization of metropolitan newspapers in the United States

was accompanied by weeklies and digests which provided a common denominator from a national rather than a metropolitan point of view. Illustrated papers and the radio responded to the demands of advertising for national coverage. The radio emphasized a lowest common denominator with profound effects on music. The significance of mechanization in print, photographs including the cinema, phonographs including the talkies, and radio has been evident in literature, art, and music. The pressure of mechanization on words has been reflected in simplified spelling and an interest in semantics. The limitations of words have led to resort to architecture and the rise of skyscrapers as an advertising medium. In North America, in contrast with Great Britain and Europe, the book was subordinated to the newspaper. Mechanization involved an emphasis on best-sellers and the creation of a gap of unintelligibility of more artistic literary works. . . . If civilization may be measured by the tolerance of unintelligibility, its capacities are weakened by monopolies of knowledge built up in the same political area using the same language. (Innis, 2007, pp. 162–163)

For this paragraph (from which several sentences addressing the history of publication are removed) Innis cites the following anecdotal sources: H. L. Mencken, *The American Language* (New York: A. A. Knopf, 1936); Q. D. Leavis, *Fiction and the Reading Public* (London: Chatto & Windus, 1932); L. L. Schucking, *The Sociology of Literary Taste* (London: K. Paul, Trench, 1944); D. L. Cohn, *The Good Old Days* (New York: Simon & Schuster, 1940); E. Haldeman Julius, *The First Hundred Million* (New York: Simon & Schuster, 1928).

Without clearly committing himself, Innis suggests that the collapse of newspaper advertising was a serious factor in the Great Depression. He makes no effort to compare it to more significant collapses in farm commodity prices, automobile sales, steel purchases, or housing. Did newspapers really elect FDR, his well-known quip notwithstanding, or did voters respond to the brutal immediacy of their circumstances? Reliable estimates of how many advertising dollars would have gone to newspapers in the absence of radio are notoriously difficult to establish. He fails to elaborate on what it means if radio content was driven by national advertising, or what content this was. He attributes a “national” point of view to media and their audiences without supporting detail while gesturing vaguely in the direction of its significance. The “profound” effects of radio on music remain unstated. Architecture as advertising invites questions about whether steel and concrete, like stone, count as time-biased media relative to “words.”

Cultural decline seems a less helpful explanation for why US newspaper readers outnumbered book readers than the cheaper price of newspapers and the modest literacy skills of an expanding immigrant population. What we should conclude about a rising rate of newspaper consumption (at a time when rates of mass market book sales were also increasing, if not so spectacularly), he doesn’t say. We are forced to guess what he means (probably nothing good) by claiming the books were “subordinated” to newspapers. Does the popularity of bestsellers really explain resistance to “more artistic literary works?” His final sentence seems to attribute intellectual and cultural openness to multilingual societies, though we cannot be sure. The troubling

proposition that “civilization” is weakened by monolingualism follows from a premise barely elaborated. Nor does he pick up and expand on this comment elsewhere in the chapter in which it appears. The point is not to throw stones at Innis’s style so much as to demonstrate his pattern of leaving key assertions and arguments undeveloped in relation both to specific historical information and whatever larger cultural conclusions he hoped to draw.

We should be troubled by his methodological rigor. Innis never tells us how it is that whole cultures can be properly described as having a single “bias.” Did he work backward from independently observed attributes in each society of interest to discover that its major (by what criterion?) media were those with exactly the biases associated with those attributes? On what grounds did he dismiss (or examine) the relative effects of other-biased media existing in the same time-space? Is his definition of media inclusive enough? His argument is disappointingly circular. He asserts that the materiality of durability and portability in selected media may be understood as proof of societal dispositions toward conservation or expansion.

What if, over time, previously durable and portable media acquire capacities they may not have had before? In her history of the impact of printing, Elizabeth Eisenstein (1979) argues that paper and printing together created new and powerful cultural memory. What we call the quattrocento Renaissance, she says, was a cultural flowering we know about mostly because it was preserved on printed paper. Previously, the memory of cultural achievements had been relatively more ephemeral, subject to decimation and erasure by epidemics, wars, and other disasters. Their successors struggled to recover, or were unaware of, the ground that had been lost. Printing reversed this process. Duplication in large quantities made unprecedented levels of written content effectively permanent even in the face of social catastrophe. Earlier content had no comparable hope of survival. Parchment, though sturdier, could not be produced in quantity. This made it altogether more fragile and less time-binding than printed paper, Innis’s argument to the contrary notwithstanding. Printed paper was both a premier medium for extending messages in space, and the default medium for modern memory as well.

Digital communication, our contemporary medium of transmission *par excellence*, has a similarly impressive history of elaborating and transforming its spatial bias. We know its earliest electrical forms as telegraphy, telephony, and radio, all memory-less modes by Innis’s lights. Over a century and a half these have morphed into a startling profusion of capacities and forms. Its development of unprecedentedly expanded reservoirs of memory poses challenges as dramatic and destabilizing, and opportunities as remarkable, as those from rapidly expanding multi-channel transmission across space. The conceptual point is that the applications, affordances, and obstacles posed by media are unpredictable and never fixed, even in their earliest manifestations. Their engagement with the cultures that produce them is never rigidly fixed.

Can we really believe that time-biased societies usually have no driving interest in present goings-on, the very definition of spatial bias? How do we know that the authority structures of so-called memory-minded societies are actually decentral-

ized? Among societies with little history of territorial expansion, we may be reluctant to concur that this has more to do with the nature of their media systems than with a lack of technological or economic capacity for aggressiveness; or, conversely, to a fortunate command of natural and economic resources satisfying to a domestic population, or, further, to political calculations and arrangements that make aggression unthinkable and costly. To soften the rigidity of his time-space matrix, Innis offers a compromise position for anomalies that are too obvious to ignore. Empire and political stability are said to be markers of a balance (the criterion is unclear) between time-binding and space-binding media in some societies. (On other occasions the term "empire" refers to a civilization-destroying, unrestrained spatial bias working its will.) There is a whiff in this confusion of a self-referential logic entangled in its own concepts and unmanageably arbitrary in its application to historical details.

Though technology has often been conceived as an instrument for progressively rendering space ever weaker in its ability to influence communicative exchange, the cosmology of media structuralism invested space with an aggressive and sinister vitality. In the abstract, compressed space of the page, Ong saw depersonalization and the shattering of human relations. In the leap of messages across distance, Innis saw bureaucratic centralism, the implementation of force, and the crushing of tradition. If space is a villain and memory a virtue, and the history of the West is mostly an obsession with space and a disrespect for time, as Innis argues, there is a paradox in his prescription for the West to pay attention to its past. What past would he recuperate? Surely nostalgia must be reckoned a vice as great as distance in the media structuralist cosmos. That human flourishing is often choked by tradition is plain, just as there are liberating, even ennobling possibilities in hopping across territory. The equation of spatiality with the tyranny of imperialism is no more defensible than the equation of temporality with the tyranny of revelation. Structurally speaking, remote, non-accountable control of distant territory is no more obviously inhumane than the sedimented brutality of racism or the oppression of women, forms of cultivated memory both.

Give Innis credit. He had a global sense of human history and a deep intuition of the perils of spreading technocratic systems. He saw that entities on the scale of nations and civilizations are complex assemblages of material and expressive elements, though this Deleuzian mode of analysis was not available to him for conceptualizing large, interactive agglomerations coalescing and dissolving across space, and producing, in time, other entities altogether. No genuinely emergent properties unfold in the just-so stories that constitute Innis's narrative. There is only the hydraulic opposition of tradition to the tireless advance of the market and industrialism, the whole too abstract to capture the deeper complexities of social change. One imagines Innis stacking fact upon alleged fact pulled from a patchwork of secondary sources of varying quality in a great Baconian pile of statements from which, added up, the truth of societal change would somehow emerge.

Though he positioned historical change as at the level of society and not psyche, Innis was very much in synch with the psychological structuralists. His monopolies

of knowledge and their associated biases run parallel to notions about literate dominance. He, too, invests dialogue with singular virtue. He, too, sees history as a narrative of the advancing spatialization of language and thought. He looks back nostalgically on human societies centuries removed (Athens and Byzantium for him; pre-literate humanity for Ong) and proclaims their lifeworlds to have been morally balanced. Of the complex morphologies of war and peace and politics, of natural resources and social classes, of countless other factors critical for assessing the “implications of the media of communication for the character of knowledge,” he had too little to say (Innis, 1991, p. 3).

What was his aim? In *Bias* he called for the revival of “effective vital discussion” and a recognition “on the part of the universities that teachers and students are still living and human” (1991, p. 32). He believed that universities with their ancient traditions of dialogue and philosophical inquiry had become extensions of the market and the state. He hoped to explain the long tale of history that had brought the West to such a state by exploring how its forms of media reflected its forms of life. This was a visionary question in the 1950s, unacknowledged in conventional historiography. The ambition of his undertaking and the inadequacy of the conceptual tools he invented should be viewed against that background. Still, we can fairly ask how his efforts to render the instrumentalities of thought visible as objects for investigation and concern stacked up against the received historical explanations he hoped to show were radically incomplete. Did he transform any established narratives or points of view? In fact, he took on no traditional periodizations, disputed no mid-range historical theories, clarified no ambiguous historical facts. He resolved no existing historical debates. At best, he mounted a parallel narrative that, lacking in significant historical depth, failed to demonstrate the essential connection, if it was there, between the intellectual and political cultures of the societies that interested him and their forms of media.

Still, he anticipated what is today a thoroughly self-conscious preoccupation of social theory. This is the problem of how to construct theoretical models able to describe the shifting and overlapping relationships of the global and the local manifest in large, technological systems running through the resilient complexity and creativity of realized life. That his schema should have failed is not surprising. Both the scale of the attempt and the lack of available data for exploring the questions that interested him made a genuinely illuminating account of how media are embedded in the shape of the world impossible to produce.

One thinks of remarkable examples of recent historical work he would have loved that are far closer to the spirit of his inquiry than his fatally simplified space-time matrix. Among them is Michael Clanchy’s (1979) discussion of the adoption of writing by the court administrators of Norman England from the eleventh century forward, their uncertain groping toward bureaucratic record keeping and retrieval, the clash with orally based proofs of real property, and the struggle of new literate conventions of law with older legal forms of social trust. Or Carlo Ginzburg’s (1980) study of a stubborn sixteenth-century French miller who confounded local authori-

ties by making cunning use of his new literate skills and limited formal knowledge. Or Gerald Strauss's (1978) account of an ill-fated experiment by sixteenth-century Lutheran reformers to indoctrinate the young in the catechism and other religious texts with an extensive regimen of oral and literate protocols and an elaborate system of evaluation that showed them the failure of their efforts. Or James C. Scott's (1998) account of how in nineteenth-century Germany the axe and the surveying text were welded into a powerful system to transform the forest into a machine for producing tax revenue, which collapsed from this catastrophic simplification of its ecosystem a century later. More recently, he would have been interested in the debate between Elizabeth Eisenstein and Adrian Johns on whether printing had a determinative role in the early modern rise of science, or whether it was only a palimpsest on which cultural habits and constructions were played out (Eisenstein, 2002a, 2002b; Johns, 1998, 2002).

Innis's grand narrative of communication history did not turn out to be of great interest to subsequent generations of historians or political economists. This reflected its shortcomings as well as a more general retreat from grand theory in the social sciences and humanities, the rise of a more fine-grained interpretive turn, and new fashions of conceptualizing power. Some of the most fruitful recent work in social theory has pursued what is now called the spatial turn as the old grand theories have morphed into new paradigms: network theory, globalization theory, assemblage theory. These worry about connectivity and messiness in space, not its determinist depersonalized footprint.

What was the Structuralist Appeal?

Where Innis's historical narrative of communication technology did have purchase was in the field of communication studies, though he may have been more often invoked than closely read. The most persuasive incarnation of his space-time schema is arguably James W. Carey's well-known essay "A Cultural Approach to Communication" (1975). As generations of students know, it contrasts a "ritual view" of communication concerned with the maintenance of society in time with a "transmission view" associated with the extension of knowledge and control across territory. Innis's spirit shows up in other work as well. It includes Josh Meyrowitz's *No Sense of Place* (1985), on how media foster a contemporary sense of rootlessness, and Neil Postman's *Amusing Ourselves to Death* (1985), a cautionary tale about the baneful influence of television.

In the 1980s a flood of new work by historians on early modern Europe began to examine that era's multiple cultures of literate and oral practices in rich detail and with considerable conceptual inventiveness and complexity. Never favored in professional historical circles, media structuralism found itself thoroughly eclipsed. We now return to a consideration of why communication scholars dreamed of locating

its lasting development within the field of media studies. That significant hopes were invested in it as a paradigmatic alternative to research on media effects can be seen in James W. Carey's (1992) estimation of the work of Harold Innis as the "great achievement of communications on this continent" that had "rescued communications from a branch of social psychology and freed it from a reliance on natural science models" (p. 142). This hopeful prediction was offered as an imagined corrective to the field's relentless present-mindedness. If McLuhan had made the cultural framing of media effects thinkable, he had offered no useable mode of analysis. Still, he drew attention to a body of work that did seem to offer a suitably weighty, ready-made historical foundation hatched in academically reliable ways whose authors urged its relevance to the unfolding media moment.

Evidence for the claims of media structuralism was drawn from societies that existed long before the nineteenth century in places other than North America, and from scattered field investigations. Such work had no precedent and could have no future in communications programs. Lacking specialist training in both the relevant historical background and primary source materials that constituted the evidential bedrock of media structuralism, communication scholars found themselves in no position to substantively refine, amplify, or critically review its claims – that is, to conduct the hard intellectual work that keeps scholarly knowledge vital and productive. This did not stop them from using it to authorize their own perspectives on the state of contemporary media and society. As it turned out, the one-variable, two-variable logic of media structuralism was not so different at its core from the effects tradition from which it claimed to depart. It may have felt familiar to its followers, immersed in the intellectual atmosphere and logic of media effect. Nor can the wielding of a shiny intellectual instrument, suggestive without being wholly clear, bolstered by erudite reference, be altogether discounted. What were taken to be the canonic texts of media structuralism were gathered into a useable past, an argument from authority.

Media structuralism answered to a deeply felt disciplinary imperative to construct a qualitative, non-experimental account of the power of media to shape not attitudes and perceptions, but whole cultures, even eras. In the context of communication studies, its root metaphor was especially apt. Technology as the privileged conceptual form of media favored in this approach seemed as solid as Dr. Johnson's table. The link from technology to moral and social meaning may have seemed equally unambiguous. Even the categories by which communications programs divided themselves up – speech, press, radio, television – authorized its aura of empirical substantiality as an antidote to the squishy impressionism of qualitative studies in the competitive politics of academic life.

Beyond their hopes of establishing a paradigm that might usefully serve a new vision of the field of communication, the followers of media structuralism aimed to enrich the intellectual resources of that field, and broaden, in the best liberal arts tradition, the range of important questions it could weigh in on. Its contributions might have been more lasting if those to whom media structuralism appealed with

the greatest force had been more thoughtful, even in the absence of specialist knowledge, about its animating premises, both its clumsy and rigid notion of media dominance and its mystified phenomenology of sensory experience. These and other premises went virtually uncriticized. Media structuralism inhabited a moment when a strategic search for disciplinary identity was resolved by substituting a deeply felt moral agenda for the work of scholarly investigation that could have made that agenda a better fit and allowed it to speak more usefully to a larger scholarly and public audience. It did stretch the imagination of the field, introduced new and searching questions about how to think about the role of communication in contemporary society, and laid sympathetic ground for the time when what is now broadly called cultural studies was able to more successfully broaden the field beyond the quantitative project of media studies. In retrospect, it stands as the unclaimed freight of communication theory, now a musty box of curiosities, witness to a lost way of looking at the world.

The Two Marxes

Bridging the Political Economy/Technology and Culture Divide

Vincent Mosco

ABSTRACT

This chapter examines how political economy and the cultural study of technology inform media analysis and history. It addresses the divide between these two perspectives on media history as a debate between Karl Marx and Leo Marx. Political economy primarily grew from the materialist conception of Karl Marx which viewed technology as dynamic but banal. Karl's work gave rise to a materialist or political economic tradition in media studies that took up the role of communication technology in class domination, exploitation, contradiction, struggle, and resistance. Leo Marx developed an approach that focused on the sublime nature of technology. In doing so, he demonstrated how technology drew people to visions of transcending the banalities of everyday life. Leo viewed the sublime as a genuine experience of meaningful transcendence and not what materialists concluded was false consciousness. Whereas Karl provided structural explanations that drew from a philosophical anthropology based in praxis, Leo offered cultural explanations based on a vocabulary rooted in aesthetics. The chapter focuses on specific tendencies and strengths within each and suggests how to draw them together.

This chapter addresses how two approaches, political economy and the cultural study of technology, inform media analysis and history. The purpose is to explore the divide between these two distinct perspectives on media history, which is in essence a debate between two Marxes – Karl and Leo. Political economy grew primarily from the materialist conception of Karl Marx which concentrated on the dynamic but banal nature of technology. This gave rise to a materialist or political economic tradition in media studies that took up the role of communication technology in the processes of class domination, exploitation, contradiction, struggle, and resistance. On the other hand, Leo Marx established a tradition that centered on the sublime nature of technology, demonstrating how it drew people to visions of transcending the banalities of everyday life. What Karl would consider false consciousness (the sublime as socially constructed ideology), Leo would view as a genuine experience of meaningful transcendence. The former provided structural explanations that drew from a philosophical anthropology based in praxis, while the latter offered cultural explanations based on the use of a vocabulary rooted in aesthetics. The chapter focuses on specific tendencies and strengths within each and suggests how to draw together these distinctive but overlapping traditions in media scholarship.

The Marxian Tradition

Karl Marx built on several different strands in classical political economy. He accepted its focus on labor as the chief source of value, although he systematically recast it to account for differences between the use value and the exchange value of labor. This departure laid the groundwork for Marx's theory of exploitation in which he focused on the difference between the value and price of labor. He called this difference the *surplus value* that accrued to capital as a result of increasing the workday (absolute exploitation) or of intensifying the labor process during the workday (relative exploitation).

Marx's critique of political economy turned, in part, on a thorough attempt to historicize the perspective and, particularly, its conception of labor. For Marx, capitalism was a system of unprecedented dynamism, continuously revolutionizing its productive processes with new technologies and new forms of organizing the labor process. Capitalist development created a continuous maelstrom of conflict and struggle. No custom, ritual, or value could block the development of the market, the production of commodities, including labor, and the growth of surplus value. The capitalist tendency to continuous revolution, what Schumpeter (1942) dubbed "creative destruction," could only be undone by forces that capitalism alone was able to release, primarily the working class, defined as those who are made to sell their labor power for a wage and thereby give up control over the means of production.

Classical political economy identified the forces propelling capitalism but tended to view them as natural. Marx sought to situate capitalism within the dialectical flow

of history, but with a materialist vision that broke with established tendencies in historiography as epitomized in the work of Hegel, who valued the history of ideas, beliefs, and the rule of law. In addition to building on much of the Hegelian tradition, particularly Hegel's concept of the dialectic and his goal of a practical philosophy (meant to fuse theory and practice), Marx took up the challenge of revolutionizing it. He would do so by showing how people make history and themselves, albeit not under conditions of their own making. For Marx, history meant, above all, how people make themselves through labor.

The Marxian critique of political economy developed an equally radical social conception of capitalism. Capitalism is a material system, not because of what it appears to be, i.e., a system of things (of machinery, workplaces, products, etc.), but because it contains a historically unique set of *social relations*. The appearance of naturalism masked the reorganization of social life principally along social class lines. Marx (1867/1976) begins *Capital*, arguably his most mature work, with a chapter on "The Commodity." But as the first sentence makes clear, although the commodity is ubiquitous, it is nevertheless a ubiquity of appearances: "The wealth of societies in which the capitalist mode of production prevails appears as an immense collection of commodities" (Marx, 1976, p. 125). Peel back the layers of appearance and we find a set of social relations, specifically "all commodities are merely definite quantities of *congealed labor-time*" (Marx, 1976, p. 130).

More generally, the social relations of capitalism embody a mass of producers who do not own the means of production but have to sell their labor power to a class of owners organized in separate firms that compete in various commodity, labor, raw material, and capital markets. Competition drives these different firms to maximize surplus value by exploiting labor in order to increase capital accumulation. The Marxian literature is filled with the debate over the precise definition and consequences of the capital-labor relationship. Nevertheless, the tendency in the traditional Marxian view is to argue that the system built on the capital-wage-labor relationship leads to the growing mechanization of labor, the concentration and centralization of capital, and periodic crises, of which the tendency to overproduction is probably the most pronounced (Mandel in Marx, 1976, p. 82). One can certainly find the seeds of this view in some classical political economy, particularly in the work of Ricardo and some of his followers. Nevertheless, until Marx, no one ventured an analysis of capitalism that so thoroughly sought to strip away the power of its apparent features that define a natural, taken-for-granted world, to reveal a set of socially dynamic, but fundamentally contradictory and, therefore unstable, social practices and social class relations.

Among the numerous critiques of the traditional Marxian view, one is particularly important to media studies: Marx did not carry the social analysis of capitalism far enough. This does not refer to the widespread, but generally mistaken, view that Marx missed the rise of today's managerial capitalism and service economy. For sympathetic critics like Baudrillard (1981), Smythe (1981), and Williams (1977), these are far less consequential than what results from an essentialist and narrow view of

labor. The traditional Marxian analysis places a great deal of weight on the concept of labor. In his early work, as well as in the *Grundrisse* (which connects the early Marx to the Marx of *Capital*), Marx envisions labor as a broad category encompassing all social activity by which people constitute themselves and history. Nevertheless, even here, the emphasis is on the instrumental and productive nature of labor rather than on its expressive and constitutive qualities. *Capital* takes an even more productivist view of labor, largely, according to Marx's defenders, because it is a critique of capitalism, one of whose central features is the narrowing of labor into the instrumental-productivist wage relationship, turning human beings into objects or mere factors of production. However, one consequence of a formulation that identifies labor as the essential material activity, but squeezes its meaning into the wage system, is that other material practices of working people are diminished. This is especially true of those practices we identify with communication, including culture, language, social reproduction, reception, and consumption. These are rendered non-material, dependent on, and in extreme formulations superstructural reflections of a material base defined by labor. According to Haraway (1991, p. 132), although Marx recognized that labor encompassed the production of human beings themselves, he gave greatest weight to the production of the means of existence providing little more than a starting point for theories of, for example, the sex/gender division of labor. For Dallas Smythe (1981), communication scholars need to expand on Marx by developing a theory of *audience labor*, what scholars today call prosumption or acts of productive consumption such as contributing to advertiser-sponsored celebrity websites.

One of the primary tasks of a political economy of media that aims to build on a critical encounter with traditional Marxian analysis is to demonstrate how communication and culture are material practices, how labor and language are mutually constituted, and how communication and information are dialectical instances of the same social activity, the social construction of meaning. Situating these tasks within a larger framework of understanding power and resistance places communication directly into the flow of a Marxian tradition that remains alive and relevant today (Potts, 2005; Saad-Filho, 2002). The next section demonstrates how the political economy of communication has carried out this task.

Political Economy

Two definitions of political economy help to capture the range of specific and general approaches to the discipline (Mosco, 2009). In the narrow sense, political economy is the study of the social relations, particularly the power relations, that mutually constitute the production, distribution, and consumption of resources, including communication resources. This formulation has a certain practical value because it calls attention to how the communication business operates; for example, how communications products move through a chain of producers, e.g., a Hollywood

film company, to wholesalers, retailers, and, finally to consumers, whose purchases, rentals, downloads, and attention are fed back into new processes of production. However, there is sufficient ambiguity about what constitutes a producer, distributor, or consumer that one needs to be cautious about using it.

A more general and admittedly ambitious definition of political economy is the study of control and survival in social life. Control refers specifically to the internal organization of social group members and the process of adapting to change. Survival means how people produce what is needed for social reproduction and continuity. In this reading, control processes are broadly political, in that they constitute the social organization of relationships within a community and survival processes are mainly economic, because they concern production and reproduction. The strength of this definition is that it provides political economy with the breadth to encompass at least all human activity and, arguably, all living processes (Foster, 2002). The primary shortcoming is that it can lead one to overlook what distinguishes human political economy, principally our consciousness or awareness, from general processes of survival and control in nature.

Another way to think about political economy is to broaden its meaning beyond what is typically considered in definitions, by focusing on a set of central characteristics. To start, political economy has consistently placed in the foreground the goal of understanding social change and historical transformation. For classical political economists of the eighteenth and early nineteenth centuries, such as Adam Smith, David Ricardo, and John Stuart Mill, this meant comprehending the great capitalist revolution, the social upheaval that transformed societies based primarily on agricultural labor into commercial, manufacturing, and, eventually, industrial societies. For Karl Marx, it meant examining the dynamic forces within capitalism and the relationship between capitalism and other forms of political economic organization, in order to understand the processes of social change that would lead from capitalism to socialism. Orthodox economics, which began to coalesce against political economy in the late nineteenth century, tended to set aside this concern for the dynamics of history and social change, in order to transform political economy into the science of economics, which, like the science of physics, would provide general, if static, explanations. According to this view, economics would be able to explain precisely how buyers and sellers come together to set prices in the marketplace, but would not address those broad processes of social and economic change that create the conditions for setting prices. Contemporary political economists, occupying various heterodox positions distinct from what has become the economic mainstream, continue the tradition of classical political economy to take up social change and transformation, focusing now on such areas as the transition from an industrial to an information economy. The study of the mass media and communication technology plays an important role in this research because the industries encompassed by these fields of study are major forces in the creation of today's economy.

Political economy also concentrates on the social whole, or the totality of social relations that make up the economic, political, social, and cultural areas of life. From

the time of Adam Smith whose interest in understanding social life was not constrained by the disciplinary boundaries that mark academic life today, through Karl Marx, and on to contemporary institutional, conservative, and neo-Marxian theorists, political economy has consistently aimed to build on the unity of the political and the economic by accounting for their mutual influence and for their relationship to wider social and symbolic spheres of activity. How are power and wealth related? How do these influence the mass media, information, and entertainment?

Political economy is also noted for its commitment to moral philosophy, understood as an interest in the values that help to create social behavior and in those moral principles that ought to guide efforts to change it. For Adam Smith (1976), as evidenced in his *Theory of Moral Sentiments*, a book he favored more than the popular *Wealth of Nations* (1937), this meant understanding values like self-interest, materialism, and individual freedom which were contributing to the rise of commercial capitalism. Whereas for Karl Marx (1973, 1976), moral philosophy meant the ongoing struggle between the drive to realize individual and social value in human labor and the push to reduce labor to a marketable commodity. Contemporary political economy tends to favor moral philosophical standpoints that promote democracy in all aspects of social life. This goes beyond the political realm, which guarantees rights to participate in government, to the economic, social, and cultural domains where supporters of democracy call for income equality, access to education, full public participation in cultural production, and a guaranteed right to communicate freely.

Finally, social praxis, or the unity of thinking and doing, also occupies a central place in political economy. Specifically, against traditional academic positions which separate the sphere of research from that of social intervention, political economists, in a tradition tracing its roots to ancient practices of providing advice and counsel to leaders, have consistently viewed intellectual life as a form of social action and social intervention as a form of knowledge. Although they differ fundamentally on what should characterize intervention – from Thomas Malthus, who supported open sewers as a form of population control, to Marx, who called on labor to realize itself in revolution – political economists agree that the division between research and action is artificial and should be overturned.

Several schools of thought in political economy guarantee a significant variety of viewpoints and vigorous internal debate. Arguably the most important divide emerged in responses to the classical political economy of Adam Smith and his followers. One set, which eventually established contemporary economics, focused on the individual as the primary unit of analysis, the market as the principal structure, and their interaction through the individual's decision to register wants or demands in the marketplace. This approach progressively eliminated classical political economy's concerns for history, the social totality, moral philosophy, and praxis. In doing so, it transformed political economy into the science of economics founded on empirical investigation of marketplace behavior conceptualized in the language of mathematics. Broadly understood as neoclassical economics or simply, in recognition of its dominant position as today's orthodoxy, economics, it is a perspective which

reduces labor to just one among the factors of production. Along with raw material, land, and capital, labor is valued solely for its productivity, or the ability to enhance the market value of a final product (Marshall, 1961; Jevons, 1965).

A second group of responses to the classic political economy of Adam Smith found it more important to retain a concern for history, the social whole, moral philosophy, and praxis. This set constitutes the wide variety of approaches to political economy. A first wave was led by a number of groups including conservative thinkers who sought to replace marketplace individualism with the collective authority of tradition (Carlyle, 1984), by Utopian Socialists who accepted the classical faith in social intervention but urged putting community ahead of the market (Owen, 1851), and by Marxian thinkers who returned labor and the struggle between social classes to the center of political economy. Subsequent formulations built on these perspectives to create a wide range of contemporary formulations.

Although economics occupies the center and center-right of the academic political spectrum, a neoconservative political economy thrives in the work of George J. Stigler (1988), James M. Buchanan (1999), and Ronald Coase (1968; Coase & Barrett, 1991), all recipients of the Nobel Prize in economics, who apply the categories of neoclassical economics to all social behavior with the aim of expanding individual freedom. Institutional political economy occupies a slightly left of center view, arguing, for example, in the work of Galbraith (1985, 2004), who drew principally on Veblen (1934, 1932), that institutional and technological constraints shape markets to the advantage of those corporations and governments big and powerful enough to control them. Institutionalists created the framework for studies documenting how large media companies control the production and distribution of mass media products and restrict content diversity, particularly by limiting views that challenge business. Neo-Marxian approaches, including those of the French Regulation School (Lipietz, 1988; Robles, 1994), world systems theory (Wallerstein, 2004), and others engaged in the debate over globalization (Sassen, 1998; Veltmeyer, 2004), continue to place social class at the center of analysis, and are principally responsible for debates on the relationship between monopoly capitalism, the automation and deskilling of work, and the growth of an international division of labor. Finally, social movements have spawned their own schools of political economy, notably feminist political economy which addresses the persistence of patriarchy and the dearth of attention to household labor (Huws, 2003), environmental political economy which concentrates on the links between social behavior and the wider organic environment (Foster, 2002), and a political economy that brings together the analysis of social movements with the Italian autonomous Marxist theoretical tradition. Dyer-Witheford (1999) has made the most productive use of this tradition in communication studies.

Communication studies has drawn on the various schools of political economic analysis. North American research has been extensively influenced by the contributions of two founding figures, Dallas Smythe and Herbert Schiller. Smythe taught the first course in the political economy of communication at the University of

Illinois and is the first of five generations of scholars linked together in this research tradition. Schiller, who followed Smythe at the University of Illinois, has a similar influence. Their approach to communication studies drew on both the institutional and Marxian traditions. A concern about the growing size and power of transnational communication businesses places their work squarely in the institutional school, but their interest in social class and in media imperialism gives their work a Marxian focus. Their research, and that of others in North America, is shaped by a sense of injustice that the communication industry has become an integral part of a wider corporate order which is both exploitative and undemocratic. Although Smythe, a Canadian, and Schiller, a US citizen, were concerned with media power within their respective national bases, they both developed a research program that charted the growth in power and influence of transnational media companies throughout the world (Smythe, 1981; Schiller, 1989, 1992, 1996, 2000; Maxwell, 2003).

North American research has produced a large literature on industry and class-specific manifestations of transnational corporate and state power, distinguished by its concern to participate in ongoing social movements and oppositional struggles to change the dominant media and to create alternatives (McChesney, 1999; Mosco, 2009; Schiller, 1999; Wasko, 2003). A major objective of this work is to advance public interest concerns before government regulatory and policy agencies. This includes support for those movements that have taken an active role before international organizations, in defense of transforming the prevailing international economic, information, and communication order (Costanza-Chock, 2003; Mosco & Schiller, 2001).

European research has taken two principal directions. The first, most prominent in the work of Garnham (1990, 2000) and in that of Golding and Murdock (Murdock, 2000; Murdock and Golding, 2000), has emphasized class power. Building on the Frankfurt School's critical theory tradition, as well as on the work of Raymond Williams (1975), it documents the integration of communication institutions, mainly business and state policy authorities, within the wider capitalist order, and the resistance of subaltern social classes and movements reflected mainly in opposition to neoconservative state practices promoting the liberalization, commercialization, and privatization of the communication industries.

Another research stream foregrounds class struggle and is most prominent in the writings of Armand Mattelart (1983, 1992, 2000). Mattelart has drawn from dependency theory, Western Marxism, and the worldwide experience of national liberation movements to understand communication as one among the principal sources of resistance to power. His work has demonstrated how poor nations, particularly in Latin America where Mattelart was an advisor to the government of Chile before it was overthrown in a 1973 military coup backed by the US government, used the mass media to oppose Western control and to create indigenous news and entertainment media.

While it is the case that scholars from developing societies are still concerned about issues of media imperialism, as evidenced by their involvement in the World Summit

on the Information Society (WSIS), there is just as much evidence that scholarship in the former Third World has taken a strong interest in political economic theory (Chakravartty & Zhao, 2008; Liu, 2006; Qiu, 2009; *Review of African Political Economy*, 2004). The process of globalizing political economy research is proceeding rapidly. Some of this results from the sheer movement of scholars, a development that has increased over the last two decades. For example, the Canadian political economist Robin Mansell established a base for institutional political economy at the London School of Economics. Yuezhi Zhao, who has provided the foundation for a political economy of China's media and telecommunications system, left China for the United States and from there moved to Canada to establish important connections among scholars in all three countries. One of her students, A. J. M. Shafiu Alam Bhuiyan, came to Canada from Bangladesh and has produced important work on political economy from the perspective of a postcolonial subject (Bhuiyan 2008). The Korean political economist Dal Yong Jin moved to the University of Illinois, Urbana and worked with Dan Schiller to complete a dissertation on the political economy of telecommunications in South Korea. He has since joined Yuezhi Zhao and Robert Hackett to continue the historically strong presence of a political economy perspective at Simon Fraser University in Canada.

Universities with a strong political economy orientation have established an institutional base concentrating on international research. For example, the University of Westminster, where Nicholas Garnham helped to found the political economy perspective, has established, under the leadership of political economist Colin Sparks, a global research program with particular strength in the study of communication systems in the Middle East and in China. His colleague Daya Thussu, a scholar from India, has established a program to examine Indian media. Similarly, the political economist John Downing, who was once based in the United Kingdom, established the Global Media Research Center at Southern Illinois University.

At a more formal level, scholarly associations have been active in their support of global research. The International Association for Media and Communication Research (IAMCR) was founded in 1957 and, for many years, served as the only global academic society to support political economy research. The organization continues to advance political economic research with an international orientation. Under the leadership of its recent president Robin Mansell and through the hard work of political economy sections heads, including Janet Wasko, Graham Murdock, and Helena Sousa, the IAMCR provides a genuine home to political economists worldwide. The establishment of the Herbert Schiller and Dallas Smythe awards to recognize the work of young scholars offers recognition and incentive for continuing the political economy tradition.

The general growth of academic journals has advanced the process of globalizing political economy but specific examples have been especially helpful to the approach. Founded in 2002 by the political economist Yahya Kamalipour of Purdue University in the United States, *Global Media Journal* has featured critical, especially political economic, research. By 2011, the journal appeared in 18 different editions: African,

American, Arabic, Australian, Brazilian, Canadian, Chinese, German, Indian, Malaysian, Mediterranean, Mexican, Pakistani, Persian, Polish, Portuguese, Russian, and Turkish. In addition to content from practically everywhere in the world, the linguistic range demonstrates a genuinely global character. Additionally, the Union for Democratic Communication, a US-based organization of critical scholars and media practitioners, has established *Democratic Communiqué*, a journal that strongly supports political economic research.

This process of global expansion has made a difference for what political economists have to say. Specifically, current research is deeply concerned with the integration of the global political economy and its media systems. Heretofore the focus was on how one (the United States) or just a handful (the United States plus the European Union) of nation-states and their own corporations dominated weaker states and their nascent economies. The result was deepening dependency and underdevelopment. Today the emphasis is on the integration of corporations, states, and classes across national, regional, and even developmental divides (Mosco & Schiller, 2001). In the view of Chakravartty & Zhao (2008), this involves the creation of a “transcultural political economy,” which they document in a book containing contributions from primarily non-Western scholars.

Corporations, including those in the communication industry, were once based in one country and moved through the world as an external force. Today they are embedded in the fabric of several societies to the point where it is often difficult to determine their national identity. Because corporations now operate as owners, partners, and in strategic alliances with companies based in the host country, political economists have shifted from focusing on the power of multinational corporations to addressing the rise of a worldwide transnational economy. Many of these companies originate in the West but the growth of other economies, notably those of China and India, render simplistic many of the standard models of Western domination. India, for example, which has traditionally been portrayed, quite accurately, as a casualty of British and then general Western imperialism, now contains its own transnational firms that have integrated into Western economies. The companies Tata, Infosys, WiPro, and ICICI have strong bases in North America, employing large numbers of workers, many of whom are eventually dismissed because, after training their own replacements, their jobs are outsourced back to India. These companies also train North American students as interns and operate their own outsourcing ventures throughout Latin America (Mosco & McKercher, 2008).

One result of these changes is a new international division of labor with the communication industry in the forefront. By creating global labor markets and by making extensive use of communication technologies to carry out the restructuring process, transnational business gains the flexibility to make the most profitable use of labor.

The global integration of corporate, government, and social class structures is fraught with risks, tensions, and contradictions. There is also considerable opposition, evidenced in the rise of social movements that have protested this development at meetings of the World Trade Organization, the International Monetary Fund, and

other international bodies like the World Summit on the Information Society. Political economists have not only examined these developments, they have also taken praxis seriously and participated at the political and policy levels. In doing so, they recognize the need to create transnational democracy and a genuine cosmopolitan citizenship.

Communication History in Political Economy

True to a central characteristic of the general theory of political economy, communication research making use of this perspective has always been sensitive to history. For example, beginning in the 1980s, historical research on the political economy of electronic media focused on the relationship between centers of political power and centers of media power. This included Herbert Schiller's (1981, 1992) research on the development of a global and heavily militarized electronic media system and Smythe's (1981) work on the history of Canadian media dependency across publishing, broadcasting, and telecommunications. Subsequent generations of scholars further developed and reworked several of these themes, emphasizing the relationship between government and corporate power. These include studies of US broadcasting (Kellner, 1990; Winston, 1986) and telecommunications (McChesney, 1993; Mosco, 1982; Schiller, 1982) as well as their counterparts in Canadian broadcasting (Raboy, 1990) and telecommunications (Babe, 1990; Martin, 1991) history. Dan Schiller's work is particularly important because it identified the growth of well-organized, large business users of telecommunications services and demonstrated how their emergence signaled a significant shift in the industry power structure. Raboy's book challenged the idea that public broadcasting necessarily contributes to political democracy by documenting how state control of the public system silenced the voices of community and civil society groups.

Research from the mid-1990s to the present has departed substantially from more traditional forms of historical analysis in communication studies which emphasized personalities, such as media moguls like Rupert Murdoch who, it is often maintained, drive the development of media. More sophisticated approaches to media history focused on the arc of technological development, equating communication history with the history of a specific medium like radio or television. However, this approach tends to reify technology, giving it a life of its own out of proportion to the ways social and political forces shape the development of technology. When traditional historical research turned to the social and political, it tended to carry out top-down studies of the policies and politics crafted by elites in government and business. Such a perspective is more useful than one that enshrines either a media mogul or a specific technology and, at its best, provides insights into the clashes between elites who share a general political inclination (Hills, 2007; Winseck & Pike, 2007). But it generally neglects to account for resistance outside of elite circles and specifically how

communication history is a more widely contested terrain. Such a recognition characterizes today's historical analyses that adopt a political economy perspective. Specifically, they demonstrate that media systems are the result of a contested history, involving not just dueling capitalists and their allies in government, but also labor unions, citizens' groups, consumer cooperatives, religious enthusiasts, and social justice organizations of all stripes.

Robert McChesney (1993) firmly established the importance of this approach in his analysis of the battle for control over radio in the United States. Neither above politics, nor the privileged policy domain of a handful of elites, radio broadcasting was recognized early on as vital to democracy and numerous social movement organizations used what power they had to democratize radio. They did so by creating broadcasting stations that trade unions, local communities, and public interest organizations of all types could control for themselves. They fought for citizen access to the airwaves to counter the dominant corporate control of radio. They also worked to democratize the policy process by making the case for popular control over regulations that gave and took away licenses, that assigned spectrum to services, and that established rules for the fair use of the medium. In essence, the struggle for radio was the struggle for democracy. More than the instrument of a handful of pioneers, radio was embedded in the most significant political battles of the twentieth century, pitting supporters of the New Deal against the dominant conservative forces which held the upper hand in US politics.

Radio broadcasting was a central instrument of what Michael Denning (1996) has called "the cultural front," a movement extending from the late 1920s to the early 1950s in the United States which provided the cultural energy for attempts to establish alternatives to America's traditional power structure led by big business. Communication scholars writing history today from a political-economic perspective are telling the detailed story of the media's role, including that of radio, in the cultural front. For example, Nathan Godfried (1997) has examined the history of a Chicago radio station created and operated by a labor federation representing unions in that city. Providing a voice for labor in a sea of commercial broadcasting was not easy, particularly since many of the unions, whose members were also fans of commercial stations, struggled to define a labor alternative. In the face of enormous commercial and business pressures, WCFL (for Chicago Federation of Labor) was able to retain its unique character through the 1940s, providing both news and entertainment from a labor standpoint. Returning to WCFL, Elizabeth Fones-Wolf (2006) takes up the role of radio in the drive to build a democratic Left in twentieth-century America. In telling the story of alternatives to commercial radio, Fones-Wolf describes the political battles that pitted labor and its allies against business in some of the central policy debates of the time. These included decisions about granting and renewing broadcast licenses, setting limits on station ownership, establishing rules about acceptable content, and defining the responsibility to air diverse perspectives (see also Fones-Wolf & Fones-Wolf, 2007).

Political economy has addressed the historical trajectories of resistance and opposition in other media, especially print journalism. For example, Tracy (2006) has written about the crucial role of the International Typographical Workers Union (ITU) in battles to control the labor process and the introduction of new technologies in the printing industry. The ITU's activism culminated in a 1964 strike that shut down the newspaper business in New York City for four months. Drawing on interviews with the leader of the labor action, Tracy documents labor's once powerful voice in the media industry. He also describes how hanging on to a narrow craft ideology ultimately contributed to muting that voice. Recent research extends this view by telling the story of the battles between craft and class among communication workers throughout the history of American media (Mosco & McKercher, 2008).

Political economy scholars have also addressed the history of resistance in the telecommunications and computer industries. Countering the traditional great inventor, technician, and pro-corporate readings of AT&T's story, Venus Green (2001) examines the crucial interplay of race, gender, and class in the company's development. Dan Schiller (2007) recounts those struggles in the workplace and in policymaking circles that challenged business efforts to control the postal and telephone system. Pellow and Park (2002) take the analysis into Silicon Valley by telling the story of the struggles first of indigenous people, then of agricultural workers, and now those of immigrant women who do the dangerous hardware work and of more privileged, but often exploited, young software workers.

It is one of the truisms in countries with a national broadcaster like the BBC or the Canadian Broadcasting Corporation (CBC) that such institutions provide a public defense against commercialism. But in her groundbreaking research on media history in Canada, Patricia Mazepa (2003, 2007) demonstrates that the story is significantly more complex and important enough to make a difference for how one thinks about public media. Drawing on archival sources, Mazepa shows that the CBC developed not only to defend against commercial broadcasting crossing the border from the United States, as most scholarship on the subject has concluded. It also fiercely protected itself from alternative definitions of "public" embodied in media produced by immigrant, socialist, and labor organizations. In Canada, public broadcasting came to be associated with white settler media, mainly English, and an elite French version based principally in the province of Quebec. Mazepa demonstrates how the Canadian state used its policy powers to undermine media emerging from outside the mainstream. Her work not only uncovers the largely ignored story of media production and resistance from below. It also calls on scholars, especially those involved in the process of making broadcasting policy, to question the meaning of "public" in public broadcasting.

Writing about the history of journalism in Canada, McKercher (2002) charts the conflicts that erupted over control of the labor process, the use of technology, and the shape of the news. These were not simply established by those who owned the

presses, nor imposed by the changing technologies in the workplace. They arose from strikes and other labor actions as well. Several of these opened spaces for workers and for those who wanted or needed a more diverse press. Many of them fell far short of success. But her historical work, like those of other political economists described in this section, offers a genuine alternative to the standard stories and, in doing so, gives back agency to social activists and workers.

The “Other” Marx

Another Marx helped to inspire an alternative to the political economy perspective. Leo Marx influenced scholars across several generations and a wide range of disciplines including history, literature, American studies, communication, and cultural studies. Marx has been a professor at MIT since 1976 where he contributed to the formation of a program in science, technology, and society. The author of numerous books on the relationship of technology and culture in nineteenth- and twentieth-century American society, Marx’s most influential work was his first book, *The Machine in the Garden: Technology and the Pastoral Ideal in America*, which was published in 1964 and reissued in 1999 with a new afterword by the author.

Leo Marx examined discourses, including the archival and literary record, to describe how technology was constituted from the sublime. Specifically, he reported on the manifold ways technology drew people to visions that transcended the banalities of everyday life. What Karl Marx concluded to be socially constructed ideology or false consciousness, Leo maintained was meaningful transcendence. Karl offered structural explanations that drew from a philosophical anthropology based in praxis. For him, analysis is rooted in political economy with the goal of transforming society. For Leo Marx, analysis is rooted in culture, and specifically aesthetics, with the goal of understanding the meanings that socially construct technology and living cultures. In *The Machine in the Garden* he described the struggle to create a US culture based on the dialectical relationship between conceptions of wilderness and of the built environment. Although both the unspoiled landscape and new technologies were invested with sublime characteristics, the American response settled, however uncomfortably, on a middle ground, the secure yet dynamic garden. For Leo Marx, the garden embodied the sublime experience in the United States until technology, beginning with the railroad, began to overtake it as the dominant cultural icon.

While it is useful to distinguish the political-economic and cultural orientations, it is also vital to resist simplistic dichotomies. Political economy has also addressed the cultural significance of new technologies. For one leading representative of the school, almost every wave of new technology, including information and communication media, contains a powerful rhetoric, “the ideology of redemption through networks” (Mattelart, 2000). Moreover, cultural scholars do not back off from political considerations. *The Machine in the Garden* begins with an assessment of the

pastoral ideal, not simply as a romantic vision or myth but as a means of preserving a way of life that was under attack from powerful elites who sought to appropriate land for their own purposes. Whether the enemy is Roman aristocrats as featured in Virgil's *Eclogues* or the leaders of the British enclosure movement, there is no shortage of political forces and conflicts in Leo Marx's cultural analysis. One of his central concepts, the sublime, is drawn from aesthetics but embodies these power relations. As he describes it, "the rhetoric of the technological sublime" involves hymns to progress that rise "like froth on a tide of exuberant self-regard sweeping over all misgivings, problems, and contradictions" (Marx, 1964, p. 207).

Just as it would be impossible for one essay to do justice to the fullness of a political economy perspective, it is necessary to focus this description of a cultural view on a few key themes. For cultural theorists influenced by Leo Marx, technologies travel a road from the sublime to the banal, from the transcendent mythic spectacle that Edmund Burke wrote about 250 years ago, to what he called the "stale, unaffection familiarity" of the banal (Burke, 1998, p. 79). For Leo Marx's student David Nye (1990, 1994), the sublime is a literal eruption of feeling that briefly overwhelms reason only to be recontained by it. Moreover, technologies enact their own mythologies and these are intimately connected to wider myths about time, space, and social relations. Finally, myths, understood not just as false statements, but as living, transcendent stories that help one to cope with life's contradictions, have significant social consequences.

Expansion of a Cultural Approach

Marx provided an opening to cultural history that others vigorously pursued. A key exemplar is one of Marx's protégés, Rosalind Williams, who built on Marx's work in *Notes on the Underground*, a book which was reissued in 2008 with a new afterword to the 1990 edition. *Notes* demonstrates that the foundation for producing social and cultural understandings of the world, including science and technology, is built on ideas and concepts drawn from aesthetics. Williams's extraordinary book starts with an enormous question: "What are the consequences when human beings dwell in an environment that is predominantly built rather than given?" (Williams, 2008, p. 1). Science, she describes, has provided some answers, but these are at best partial because each term in the question both reduces to and vehemently resists quantification and other tools of traditional science. After all, as Mircea Eliade, Leo Marx, and other cultural historians have described, the vast shift from a pastoral to an agricultural society, which constituted a new stage in built environments, certainly produced measurable increases in human material capabilities but also social, cultural, and spiritual upheavals that resist scientific tools of analysis. Understanding the shift to the technologically built environment requires not a reduction to science but an expansion of our imaginative capacity that includes ideas drawn from culture, the arts, and from aesthetics.

Starting from this premise, Williams takes us into the modern history of the mine, a story that embodies the concrete practice of science, digging to find resources, but also reflects the spirit of science, one that Francis Bacon captured in his then radical vision that “truth is to be sought in the deepest mines of nature” (Williams, 2008, p. 46). This leads Williams to examine first mines then railroads to understand the mutual constitution of their material and cultural dimensions. But a genuine understanding does not arrive until she deploys a foundation built on aesthetic notions of sublimity, fantasy, magic, and terror, which, along with other concepts, create an “underground aesthetics” to comprehend the construction and the descent into a new built environment. A cultural analysis is necessary because science and its attendant materialisms are limited: “The web of relationships between human beings and the earth that involve values, memories, symbolic representations, meanings, histories, anticipations, social organizations, and cultural connections – all these critical relationships cannot be framed within the normal procedures of science, and so they are often not framed at all” (Williams, 2008, p. 260).

James Carey (1992) followed this train of thinking with his research on the “electrical sublime,” a perspective that influenced my research on the “digital sublime” (Mosco, 2004) and that of other cultural scholars (Czitrom, 1982). Much of the discussion of the technological sublime draws on the classic work of Edmund Burke (1998), who remarked that the sublime so fills the mind with its object that it cannot entertain any other nor apply reason to it. Why? Because the sublime emerges from “whatever is fitted in any sort to excite the ideas of pain and danger, [. . .] whatever is in any sort terrible, or is conversant about terrible objects, or operates in a manner analogous to terror” (p. 86). Unlike beauty and love, which, according to Burke, transcend the banal through pleasure and identification, the sublime achieves transcendence through astonishment, awe, terror, and psychic distance.

The sublime was originally associated with natural wonders including, as David Nye (1994) has examined, such US icons as the Grand Canyon, Niagara Falls, the Natural Bridge, or Yosemite. Indeed, it is this version of the sublime to which Burke directed his attention. As he remarked, “It comes upon us in the gloomy forest, and in the howling wilderness, in the form of the lion, the tiger, the panther, or rhinoceros” (Burke, 1998, p. 109). Later, when the natural gave way to the technological, the sublime came to be associated with the human-constructed world, including, but not limited to, modes of transportation like the railroad and airplane and awe-inspiring projects like the Hoover and Glenn Canyon dams (Steinberg, 1993). In the novel *Mrs. Dalloway*, Virginia Woolf brilliantly captures the sublime image of mechanized flight and foreshadows the inevitable banality of the airplane as she describes one soaring in the skies over London shortly after World War I. The vision is seemingly magical until it is discovered to be advertising a popular candy.

One of the central contributions of Leo Marx and the cultural school of thought has been to demonstrate that history is filled with myth-making about technology and has much to say about how we invent myths whenever we invent technology. People want to believe that their era is unique in transforming the world as we have known

it. The end is preferred to more of the same; the transcendent to the routine; the sublime to the banal. So we not only view our age as revolutionary. We forget that others looked at earlier technologies in the same way.

Scholars such as James Carey (1993), Susan Douglas (1986), Carolyn Marvin (1988), and Tom Standage (1999) have documented this tendency for the telegraph. In *The Victorian Internet* Standage writes that in the minds of many, time and space began their transformation when in December 1868 a room full of banquet guests enjoying the feast at Delmonico's restaurant in New York raised their glasses to Samuel F. B. Morse whose new invention, their toastmaster proclaimed, "annihilated both space and time in the transmission of intelligence" (Standage, 1999, p. 90). Or perhaps the transformation began even earlier in 1858, when the British Ambassador rose to toast another contributor to the success of the transatlantic telegraph, Edward Thornton, whose invention the diplomat enthusiastically called "the nerve of international life, transmitting knowledge of events, removing causes of misunderstanding, and promoting peace and harmony throughout the world" (Standage, 1999, pp. 90–91). One magazine exclaimed that "our whole human existence is being transformed" and another envisioned telegraphy creating its own "ghostland." And according to another, "Wars are to cease; the kingdom of peace will be set up" (Douglas, 1986, p. 40). And, as Marvin (1988) describes, if not the kingdom of peace, then the kingdom of God. An early prophet of transoceanic telegraphic communication, Alonzo Jackman, offered a vision of the salvation of the world through instantaneous long-distance communication in a "new era" of evangelism and proclaimed: "Heathenism would be entombed, and the whole earth would be illuminated with the glorious light of Christianity" (Marvin, 1988, p. 192).

Leo Marx's student David Nye and communication scholar Carolyn Marvin document the importance of reflecting on how, shortly after the telegraph made its triumphant entrance, electricity burst into spectacle. Here is how one turn-of-the-century magazine described its magical power:

Look from a distance at night, upon the broad space it fills, and the majestic sweep of the searching lights, and it is as if the earth and sky were transformed by the immeasurable wands of colossal magicians and the superb dome of the structure that is the central jewel of the display is glowing as if bound with wreaths of stars. It is electricity! (Nye, 1990, p. 38)

As historical research on the telegraph and electricity show, today's world of new media is not the first to be christened with magical powers to transcend the present and institute a new order. But they also demonstrate that transcendence is not easy to sustain. For Nye, the sublime eventually fades into the banality of everyday life. Just as the telegraph disappeared into the woodwork of routine commerce, electricity lost its compelling allure. Nye notes: "Electrical novelties faded quickly and became 'natural.' In 1880 one arc light in a store window drew a crowd; in 1885 a lighted mansion still impressed the multitude; in the 1890s came the first electric signs. Each in turn became normal and hardly worth a glance" (Nye, 1990, p. 57).

Michelle Martin (1991) picks up the pieces of this story with her analysis of the telephone. If the telegraph's lightning wires made up the Victorian Internet then the telephone's pairs of twisted copper made it the Internet of the Gilded Age and the Roaring Twenties. Martin shows how early promotion of the telephone described the characteristics of "a new social order" that the telephone would bring about. It would be both a "business savior" by permitting distant shopping and a liberator of "women slaves" since telephone shopping would lighten the load of homemakers. It would guard against "nervous strain," provide "safety for your family," reduce "household fatigue," and make writing an anachronism. In short, it was the device that could "save the Nation" and so the decision to purchase a phone was considered more than a voluntary consumer choice but "a moral obligation for a considerate husband and a good citizen" (Martin, 1991, p. 37). Marvin echoes this view, noting that "perhaps more than any other communications invention, contemporaries considered the telephone the bellwether of a new age." She cites the magazine *Electrical World's* enthusiasm for the telephone as "the voice crying in the wilderness" (Marvin, 1988, p. 209).

For Martin, Marvin, Claude Fischer, and others, the telephone became one of the central icons of modernity, the medium that marked the turn of the twentieth century. But once again they demonstrate how the sublime aura wears thin. Fischer (1992) documents this for the telephone in interviews with generations of early telephone users. The older interviewees, people who began to see telephones in use in the 1890s, "described the telephone in tones suggesting awe," demonstrably moved by the act of hearing a distant voice and responding to it immediately. But this did not last for long, as those who took up the phone after the turn of the century attest. Statements like "Seems like we always had a telephone" and "Telephones were no big deal. It wasn't like you never saw a telephone" are common among those born just a few years later. For US citizens, the awe and the aura of the telephone disappeared after 1910 (Fischer, 1992, p. 243).

But once again, as Susan Douglas, Clayton R. Koppes, Thomas Lappin, and Eric Barnouw describe, the banality of one technology is matched by the emergence of a new sublime. The magic of messages transmitted through the air with no evidence of their passage was more than just the work of God, it was the medium of God's work. In 1922, Secretary of Commerce Herbert Hoover, a man ordinarily not prone to hyperbole, remarked on the wonder of "wireless fever" which had to be "one of the most astounding things that [has] come under my observation of American life" (Douglas, 1987, p. 303). Admittedly self-interested, the president of the Radio Corporation of America, General James G. Harbord, captured the history-making and history-ending power of radio with this analogy to the invention of printing that sounds more like a prayer than an observation:

Radio broadcasting, I devoutly believe, is the greatest force yet developed by man in his march down the slopes of time. Since Gutenberg devised his crude wooden type and made printing possible, nearly five centuries ago, there has been no single invention which so closely touches human interest and human welfare as this miracle of the age. (Koppes, 1969, p. 365)

Many of the same promises made about the telegraph, electricity, and the telephone were applied to this latest “miracle of the ages.” Like the others, it would serve as a potent force for social cohesion and world peace. One can understand that the president of the General Electric Company would see radio “as a means for general and perpetual peace on earth.” After all, GE owned RCA and had a huge stake in the development of broadcasting. One can also understand that Marconi, the widely described “father of wireless,” would see radio as “the only force to which we can look with any degree of hope for the ultimate establishment of permanent world peace.” But even those without a commercial stake in the technology weighed in with their utopian visions. The Episcopal bishop of Washington, DC gave his blessing to the new medium with the exclamation that “I believe the radio will be a potent factor in making the twentieth century the age of the brotherhood of man. More and more I have come to feel that this growing feeling of brotherhood may result from the intimacy and fellowship created through the medium of the air” (Koppes, 1969, p. 365).

More significantly, Koppes stresses, observers felt that radio would promote an epochal transformation in political life, the growth of direct democracy. In arguments that are strikingly like those we hear today about the Internet, radio would allow the listening audience direct contact with those in power. *The New Republic* magazine praised radio because “It has found a way to dispense with political middlemen. In a fashion, it has restored the demos upon which republican government is founded. No one will capture the radio vote unless he faces the microphones squarely and speaks his mind fully, candidly, and in extenso” (Koppes, 1969, p. 366).

Radio was also predicted to strengthen the quality of political oratory: “There is no doubt whatever that radio broadcasting will tend to improve the quality of speeches delivered at the average political meeting.” Why? Because “personality will count for nothing as far as the radio audience is concerned. Ill-built sentences expressing weak ideas cannot succeed without the aid of forensic gesticulation. The flowery nonsense and wild rhetorical excursions of the soap box spellbinder are probably a thing of the past if a microphone is being used” (Lappin, 1995, p. 218). Furthermore, as Lappin demonstrates, contemporary proponents of “virtual education” would find many of their arguments foreshadowed in radio’s early years. The first radio courses in the early 1920s prompted *Radio Broadcast* magazine to forecast “the advent of the ‘University of the Air.’” One enthusiast declared: “The lid of the classroom has been blown off, and the walls have been set on the circumference of the globe.” Thanks to radio, “every home has the potentiality of becoming an extension of Carnegie Hall or Harvard University” (Lappin, 1995, pp. 366–367).

But once again, just as the garden paradise in Leo Marx’s early United States turned into the banality of suburbia, it would not be long before the forces of banality would undermine the magic of radio. Douglas sees bad omens by the end of the second decade of the twentieth century as first military and then large corporate interests began to recognize the value of the new medium and lobbied to push off the air the young amateurs and educators who envisioned a utopian future for and with radio. The arrival of advertising and big business, with their interest in transforming the high-minded University of the Air into a medium to sell products with popular

entertainment, led serious writers of the late 1920s to question whether radio would succeed. In 1927, as Lappin describes, *The New Republic* magazine, which had predicted that radio would create a new democratic age, now complained that “It turns to propaganda as easily as the aeroplane turns to bombing; it sows its seeds with a wider throw” (Lappin, 1995, p. 369). By 1930, the magazine could only conclude that “broadly speaking, the radio in America is going to waste” (Lappin, 1995, p. 374). Media historian Eric Barnouw describes how Lee de Forest, one of radio’s founding inventors, concluded that radio had become “a stench in the nostrils of the gods of the ionosphere” (Barnouw, 1968, p. 234). Once very optimistic about the technology he helped to create, de Forest complained bitterly in a letter to the 1946 meeting of the National Association of Broadcasting. Attacking the proponents of commercial radio, he demands to know:

What have you done with my child? You have sent him out in the streets in rags of ragtime, tatters of jive and boogie woogie, to collect money from all and sundry for hubba hubba and audio jitterbug. You have made of him a laughing stock to intelligence [. . .] you have cut time into tiny segments called spots (more rightly stains) wherewith the occasional fine program is periodically smeared with impudent insistence to buy and try. (Barnouw, 1968, p. 234)

Nevertheless, as cultural analysts of television describe, his hopes rose again with the latest new medium.

As radio joined other communication technologies that promised but failed to transform time, space, and social relations, another powerful device, television, captured the popular imagination and attracted the sublimity that earlier technologies lost. As Kisselof (1995) and the Fishers (1996) demonstrate, television’s first encounter with “end of everything” promises began with broadcast television, which spread widely beginning in the early 1950s. Its second arrived with cable television, which inspired dreams of a “wired nation” in the late 1960s and early 1970s. The first period of television’s promise viewed the medium in terms familiar to anyone who heard about how radio would realize democracy, world peace, social harmony, and the transformation of mass education. As David Sarnoff, the founder of RCA, boasted at the 1939 New York World’s Fair, television would provide “a torch of hope in a troubled world” (Kisselof, 1995, p. 51). It would do so by guaranteeing “a finer and broader understanding among all the people’s [*sic*] of the world” (Fisher & Fisher, 1996, p. 350). Few people’s expectations rose higher (or ultimately sank deeper) than those again of Lee de Forest, inventor of the vacuum tube. In 1928 he expounded on the medium he was helping to create by gushing over:

What thrilling lectures on solar physics will such pictures permit! [. . .] What could be a more fitting theme for a weekly half-hour of television than a quiet parade through some famous art gallery, pausing a moment before each masterpiece while the gifted commentator dwells briefly upon its characteristics, explains its meaning, recounts the story of its creation, its creator? [. . .] Can we imagine a more potent means for teaching the public the art of careful driving safety upon our highways than a weekly talk

by some earnest police traffic officer, illustrated with diagrams and photographs? (Fisher and Fisher, 1996, p. 91)

Television held out a promise not experienced since the arrival of the electric light and the automobile, and all three are mythologized in Dunlap's early work on television, which declared: "The advent of the television era can be compared in importance with the arrival of the electric light that dimmed the glory of candle and kerosene lamp; with the arrival of the automobile that relieved the horse, sped up travel and introduced good roads that linked the farm with the city" (Dunlap, 1932, p. 224). In short, television "is the wizardry of the age" (Dunlap, 1932, p. 258).

The enthusiasm grew with the promise of cable television. In fact, as Ralph Lee Smith (1972) documented, there was arguably a greater sense that cable would bring an epochal transformation in communication. Broadcast television held out great promise but it was hard to argue with those who saw it as largely a video extension of radio. But cable television was something completely different because it had the potential to link every home and workplace in an interconnected system. It is no wonder that one of the period's more popular books on the subject was called *The Wired Nation – Cable TV: The Electronic Communications Highway*. In fact, cable television was constructed with a similar sublimity as has been the case with the Internet. Indeed Smith put it in language now familiar to even the casual Internet observer: "In the 1960s, the nation provided large federal subsidies for a new interstate highway system to facilitate and modernize the flow of automotive traffic in the United States. In the 1970s it should make a similar national commitment for an electronic highway system, to facilitate the exchange of information and ideas" (Smith, 1972, p. 83). But anticipating the banality to come, he feared that "short-term commercial considerations [would] dictate the form of the network" (Smith, 1972, p. 83).

Computer communication is the latest version of Leo Marx's technological sublime, at once both the banal infrastructure for globalization and the sublime vision of a universal intelligence celebrated in the breezy optimism of *Wired* magazine as well as in the disturbing visions of the theologian Teilhard de Chardin (1959, 1964), who imagined the "noosphere," a literal atmosphere of thought mounting in pressure upon a globe whose linked intelligence prepares the way for an evolutionary leap. Digital communication renews what was once promised by the telegraph, telephone, radio, and television by offering the literal connection, the missing link that will bring about transformation to time, space, and social relations. The remainder of this chapter situates my own research on computer communication in this stream of cultural analysis (Mosco, 2004).

The Culture of the Digital Sublime

Today's communication technology embodies the sublime and with it anoints the world with a near-apocalyptic quality – the end of history. The world experiences,

in the work of Frances Fukuyama (1992), Nicholas Negroponte (1995), and Ray Kurzweil (1999), to name just some of the leading thinkers, a radical disjunction in time, opening the way to a new epoch no longer bound by the economic, technological, or even biological limitations that characterize every historical period. For Fukuyama (1992), new media and liberal democracy mark the end point in an evolutionary process that has taken people through stages of development (e.g., hunting and gathering, agriculture), modes of thinking (mythic, religious, philosophic), and forms of governance (tribal, feudal, communist, fascist). For the founding director of MIT's Media Lab, Nicholas Negroponte (1995), the end of history comes with the end of an analog world and the arrival of a digital one to which we must accommodate. In matter-of-fact prose, he provides a modern-day prophet's call to say goodbye to the world of atoms, with its coarse, confining, materiality, and welcomes the digital world, with its infinitely malleable electrons able to transcend spatial, temporal, and material constraints. The world of atoms is ending, he says; we must learn to be digital. Ray Kurzweil (1999) brings the ballast of strong technological credentials to a bestselling book that casts the end of history in biological terms. The radical disjunction means the end of death as we know it because we are rapidly refining the ability to preserve our intelligence in software so that "life expectancy is no longer a viable term in relation to intelligent beings" (Kurzweil, 1999, p. 280). For Kurzweil, one of history's fundamental problems is that we have been dependent on the "longevity of our *hardware*," that physical self which he laments through Yeats as "but a paltry thing, a tattered coat upon a stick" (Kurzweil, 1999, pp. 128–129). History as we know it ends as we "cross the divide" and "instantiate ourselves into our computational technology" (Kurzweil, 1999, pp. 128–129).

In addition to crossing the divide in time, cyberspace helps to cross the spatial divide, putting an end to geography as we know it. For Frances Cairncross (1997), this means the "death of distance," as cyberspace, unlike material space, permits us to experience what it means to be anywhere at any time we choose. Accepting this view, Kenichi Ohmae (1990) celebrates a "borderless world" where any attempt to create boundaries is doomed to failure or what William Mitchell (1995, 1999) calls an "e-topia" of near boundless choices for where and how we live and work. For him, computer communication does not just extend geometry: "The Net negates geometry [. . .] it is fundamentally and profoundly *antispacial*. The Net is ambient-nowhere in particular and everywhere at once" (Mitchell, 1995, p. 8). Even those like Margeret Wertheim (1999) who take a less triumphalist view still see cyberspace as spatially disjunctive, exploding the singularity of the Enlightenment's vision of one empirical space and introducing an experience dimly reminiscent of the medieval era where existential space is inherently dual – composed then of secular and spiritual space, today of material and cyberspace.

Finally, cyberspace promises to end politics as we know it by undermining bureaucratic constraints on building networked democracies and by sweeping away age-old strategic thinking (Mosco & Foster, 2001). In the work of the Tofflers (1995), George Gilder (1989, 1994, 2000), and others, the end of politics means more than just using

computer communication to create electronic democracy. It also redefines politics by grounding power in networks rather than in institutions. New economic power rests in looser structures, systems with nodal points whose power derives not from their geographical supremacy but from networked interdependence and flexibility. Real-time and 24-hour networks of information flows transcend the physical city and the nation-state too, creating new laws with which politics must comply or be threatened with extinction. Proponents go as far as to envision a quantum politics whose indeterminacy mirrors that of the subatomic world. The end of politics also means the end of fear, particularly the age-old fear of military attack because computer communications enables a defense against it. The need for offensive weapons and strategies of mutually assured destruction disappears as ballistic missile defense systems lift a protective umbrella that shields the world. From the time that Ronald Reagan first called for such a defense, telling Gorbachev that he saw the “hand of providence” in it, to George W. Bush’s reinvention of these systems and their stubborn persistence today, we hear the language of a new dawn in global security, of world peace, driven by a kind of *machina ex deo* that will transform politics as we have known it throughout history.

Cultural studies scholars help one to understand how stories about communication technology envision a radical transformation in temporal, spatial, and social relations. They maintain that while computer communication may not bring about the end of history, of geography, and of politics, there is a lot to be gained from research that addresses why it is not and why people believe that it is. Specifically, one of the reasons why variations on “the end of” stories are so popular is because people collectively forget that technology is constructed with and through the sublime. New media gurus encourage thinking about the end of history, the end of geography, and the end of politics. Everything has changed. So one can apply the mute button to whatever has come before. After all, history has nothing to say to us because it knows nothing of new media. But quite to the contrary, cultural analysts insist that history is filled with stories about technological sublime and research needs to engage this point directly.

Then why do people so willingly acquiesce, indeed actively affirm, stories about the end? It is not just the mechanisms of political economy, including the power of gurus, the mass media looking for a good story, politicians wanting to be identified with the next new thing, and advertisers eager to market the latest promise to transform life as we know it. These are undoubtedly important forces in compelling belief and action. But there is more to it than this. Cultural theorists and historians remind us that active affirmation does not just come from external pressure. There is something powerfully attractive about the culture communication networks, not just the Internet that formed the basis of my book *The Digital Sublime* but the ensemble of new social media that Eran Fisher (2010) examines in *Media and New Capitalism in the Digital Age: The Spirit of Networks*. Nevertheless, as these and other cultural analyses that build upon the work of Leo Marx describe, this magnetic power extends back in time to earlier examples of the electrical sublime and further back to the technological

and the natural sublime. Consequently, we need to understand political-economic pressures within the cultural context of meaningful narratives that lift us out of the day-to-day and designate us as a special, perhaps even a chosen, people. Put simply, people want to believe that their era is unique in transforming the world. The end is preferred to more of the same; the transcendent to the routine, the sublime to the banal. So people not only view their age as revolutionary. They forget that others looked at earlier technologies in much the same way. It is only when we see today's media as mutually constituted out of a culture that creates sublime meanings and a political economy that empowers it that we can fully understand why it is that over and over again, people have encountered and believed in a genuinely living end.

For the followers of Leo Marx, history, geography, and politics ended in the 1850s when the telegraph was introduced. They ended again a few decades later when electrification lit up cities, but the stories were largely forgotten when electricity literally withdrew into the woodwork. The end came once more when the telephone brought about a renewal of these narratives. In the 1920s the arrival of radio brought along its own cast of storytellers who saw it marking a radical change in time, space, and social relations. In the 1950s television changed the world and then changed it again in the 1960s with the multi-channel world of cable television and again with today's new media. As one cultural theorist has concluded in what amounts to an understatement: "The structure of the history of technology itself is such as to encourage particular philosophical attitudes. Most commonly the particular philosophy involved is an optimistic, not to say triumphalist view of both the history of technology and the nature of man" (Mitcham, 1973, p. 169).

Bridging the Divide

The cultural history advanced by Leo Marx and his followers is part of a broad-based intellectual movement that focuses on the constitution of meaning in texts, including all forms of social communication. The approach contains numerous currents and fissures that provide for considerable ferment from within. Nevertheless, it can contribute to the understanding of political economy in several ways. Cultural studies has been open to a broad-based critique of positivism (the view that sensory observation is the only source of knowledge). Moreover, it has defended a more open philosophical approach that concentrates on subjectivity or how people interpret their world, as well as on the social creation of knowledge. Cultural studies has also expanded the meaning of cultural analysis by starting from the premise that culture is ordinary, produced by all social actors rather than primarily by a privileged elite, and that the social is organized around gender and nationality divisions and identities as much as by social class.

Although the political economy approach derived from Karl Marx can learn from these departures, it can also contribute equally to enrich the cultural approach. Even

as it takes on a philosophical approach that is open to subjectivity and is more broadly inclusive, political economy insists on a realist epistemology that maintains the value of material historical research, of thinking in terms of concrete social totalities, with a well-grounded moral philosophy, and a commitment to overcome the distinction between social research and social practice.

Whatever the divisions between the two Marxes, the process of research should bring together, not separate, intellectuals and cultural producers. It ought to build a common understanding and common political purpose that can advance the democratization of social life. In making this call, critics, including political economists, must remind themselves of their own wider purpose, which includes forging intellectual and political links across disciplinary boundaries. There is much to be gained by continuing the conversation between the legacies of the two Marxes.

The Conditions of Media's Possibility

A Foucauldian Approach to Media History

Jeremy Packer

ABSTRACT

This chapter integrates Michel Foucault's historiographic approach with media history. After describing how Foucault's work has traditionally been used and understood by media historians, four areas of work are used as examples for establishing a more holistic account of the value of Foucault's archaeological and genealogical methods of historical enquiry. They are (1) the work of German media theorist Friedrich Kittler, (2) the Stanford School of the philosophy of science, (3) cultural studies work in governmentality studies, and (4) Giorgio Agamben's application of the Foucauldian concept apparatus. After providing eight questions for orienting Foucauldian historical investigation, the chapter explains how this leads to understanding the interrelated dimensions of power, knowledge, and subjectification as they intersect with the historical establishment of media forms, institutions, and technologies.

Michel Foucault was not a media historian. This statement is neither surprising, nor likely to meet with much resistance. While clearly the books and texts forming the archives of Foucault's investigations are media, their explicit materiality as technologies for overcoming time and distance, reducing noise, or maintaining culture, was very rarely if ever the focus of his historical investigations.¹ Yet, numerous scholars

have drawn upon Foucault's work in their historical investigations of media. An obvious question might then be, "How does one do Foucauldian media history?" In a schematic and overly generalized fashion, a simple answer is that there are two clearly distinct ways of bringing Foucault's thought to bear on media history. First, Foucauldian concepts, such as disciplinarity, the confessional, or panopticism, could be applied to the historical dimensions of media forms and technologies. This approach might be called the Foucauldian toolbox approach. Though it will not be developed herein, Foucault himself was certainly not dismissive of such application of his work as he suggested his own books might make up "a kind of tool-box others can rummage through to find a tool they can use however they wish in their own area [. . .] I don't write for an audience, I write for users, not readers" (Foucault, 1994). While keeping Foucault's consideration in mind, I would like to suggest a more robust form of Foucauldian media history.

This second approach would entail combining Foucault's two primary historiographic methods, archaeology and genealogy. Using them to investigate the historical processes of mediation, the creation and use of media technologies, and/or the rise and fall of media institutions could bear ripe fruit. Archaeology is Foucault's practice of investigating the historical constitution of a specific field of knowledge and can be seen most readily in his early work on psychology (Foucault, 1988), medicine (Foucault, 1994), and the human sciences of economics, biology, and linguistics (Foucault, 2002). Foucault's description of this method is most fully elaborated in *The Archaeology of Knowledge* (1982a). Genealogical investigation asks how power has been historically constituted and resisted through governmental rationalities, forms of knowledge, and practices of the self. Foucault (1977) specifically addressed power in groundbreaking ways in its productive capacities, as opposed to merely its working as a mechanism of oppression (Foucault, 1978). Further, he elaborated an understanding of rationalities for rule that organized power according to three variably arranged modes; sovereignty, disciplinarity, and security. Bringing archaeology and genealogy together provides a more "Foucauldian" form of historical investigation than the toolbox mode (not necessarily validating in and of itself). More importantly it allows for an analysis that can systematically focus upon three interlocked concerns (1) the production of knowledge, (2) relationships of power, and (3) modes of subjection. These three arenas serve as a kind of Foucauldian triumvirate that he and others suggested ruled over all of his work.² The toolbox approach is most common in media studies generally and to some degree in media history as well. However, there have also been archaeologies of thought regarding communication, if not precisely media. Armand Mattelart's *The Invention of Communication* (1996) stands out as an exemplary Foucauldian account of this form. While not explicitly Foucauldian, one could read John Durham Peters's *Speaking Into the Air* (1999) in a similar light. Mattelart focused primarily upon France while Peters was more concerned with the development of thought in the United States.

This chapter will first situate some of this work within the field of media history, leaning heavily upon John Nerone's (2003) schematic of the field while

acknowledging that recent work such as the collected volume *Media Archaeology* (Huhtamo & Parikka, 2011) presents other interesting means for following up on some of Foucault's archaeological concerns. It will then proceed to describe work that develops Foucauldian approaches for doing archaeology and genealogy that are particularly well suited to an analysis of media history. These models will come from four sources: (1) Friedrich Kittler's discourse-analytical approach to media history; (2) the so-called Stanford School of the philosophy of science, paying particular attention to their understanding of scientific instruments; (3) key work in cultural studies that builds upon Foucault's concept of governmentality; and (4) Giorgio Agamben's recently translated essays on method (Agamben, 2010) and the apparatus (Agamben, 2009). Each of these key historiographic and theoretical considerations will be developed to help us build a model of media history that avoids some of the criticisms directed at previous Foucauldian work in the field.

What results may allow for a directive to address the interconnections between power, knowledge and subjectification. These three problematics were taken up as the organizing principle for Gilles Deleuze's book-length explanation of Foucault's work, simply titled *Foucault* (1988). In it he explained how they form the backbone of Foucault's epistemological, ontological, and methodological foundations. I will ultimately suggest that a thoroughly Foucauldian media history should attend to the intermixing of these three elements as they elaborate an apparatus. Starting with such a conception and by asking questions related to media processes, we can see how genealogical and archaeological investigation can be put to good use for understanding how subjects come into being through mediation, entwined within technological and governmental relations of power, whose existence depends upon scientific and vernacular knowledge productive of and produced by media technologies, institutions, and forms. Such an approach would take Foucault's definition of technology as a starting point.

In an insightful interview in 1982 Michel Foucault was asked a series of questions that were meant by the interviewer, Paul Rabinow, to clarify Foucault's understanding of the relationship between architecture and politics. In an interesting redirection, one of Foucault's defining strategies, he explains that when it comes to understanding space and power, architects have since the nineteenth century taken a back seat to engineers and technicians devoted to the three great variables "territory, communication, and speed."³ He argues that the political imaginary was no longer dominated by an idealized notion of the city whereby the state was imagined as if it were an extended city. Rather, with the advent of railroads and "a network of communication" the nature of the social and how one must govern were differently problematized. As a result, new behaviors and new forms of resistance radically transformed the population and a new political imaginary emerged which recognized the centrality of the media necessary to create and maintain greater and quicker communication.

Foucault ends the interview with a discussion of how he would approach the history of a specific field of practice and thought that bridged the divide between the technical and the aesthetic, in that instance architecture, though I will argue the

same could hold for media. Foucault would focus on *tekhne*, “a practical rationality governed by a conscious goal” (Foucault, 2000, 364). Recognizing the possible conflation with the term “technology” understood too narrowly in his view as “hard technology, the technology of wood, of fire, of electricity,” Foucault asserts we also should broaden our understanding of “technology.” He claimed for instance that “government is also a function of technology: the government of individuals, the government of souls, the government of the self by the self, the government of families, the government of children, and so on.” Thus the historical study of a specific *tekhne* would demand situating it within the broader sense of the word to understand how it functions in terms of a practical rationality and a means to govern specific practices and peoples. Such an approach could lead us to ask, “Why and in what ways have media been imagined as an arena of analysis and application that could accomplish such practical goals?”

I invoke this interview not because it is one of the few places Foucault actually addresses communications or media in relation to technology, nor because it is the only possible directive for imagining what Foucauldian media history might look like.⁴ As I will argue below, there are numerous routes leading toward such an enterprise, none of which necessarily need cross paths with these few passages. However, the interview does point us in a few interesting directions that will be taken up later. First, Foucault’s broad understanding of technology will help us get out of a division in the field of media history that John Nerone (2003) has expressed in terms of media/technology versus media/institution. Second, Foucault’s assessment of the centrality of communication technologies in the reformulation of governance might be seen as a defining feature of media history. This was due in large part to the changed scale and tempo of the governmental imaginary that follows from the increased speed and reach of media, configured here as both communication and transport, following from some lines of thought more thoroughly elaborated by such figures as Harold Innis, Marshall McLuhan, Lewis Mumford, and James Carey.

Foucault’s Legacy and Media History

The work of Michel Foucault continues to have a more profound effect upon the humanities and social sciences in English-speaking countries than any other intellectual figure to emerge in the second half of the twentieth century or the early years of the twenty-first. While such a claim may seem contentious, if quantitative measures count for anything, a study by *The Times Higher Education* in 2009 showed that Foucault was the most cited author in the humanities. Further, Foucault has been the most cited figure in the Arts and Humanities and Social Sciences Citation Index every year since 1985, the year following his death (Nealon, 2009). In the midst of such evidential significance, having to defend against the question “Why Foucault?”

would seem a bit tedious in any field. However, there are contextually specific reasons for explaining “Why Foucault for media history?”

Within the humanities no field may have been as simultaneously vexed and enchanted by Foucault’s work than history. While it is not within the scope of this essay to consider the decades-long debates that Foucault’s work has inspired, John Nerone has nicely summed up this tantalizing yet uncomfortable affair:

Certainly we don’t read Foucault’s histories of sexuality to learn how the Greeks screwed; rather, they are exercises in the philosophy of the self, and therefore relatively impervious to falsification from the archives. The same might be said to be true of histories in the mode of media/technology generally, which have a durability that more prosaic histories lack. We will be reading McLuhan, like Foucault, long after diligent scholars have disproven or complexified all of his factual conjectures. (Nerone, 2003, p. 99)

Nerone’s description provides a transition to our more immediate topic, media history.

Several prominent scholars have pointed out that the field of media history still suffers from growing pains and as of yet has nothing resembling an official cannon (Nerone, 2003, 2008; Peters, 2008a; Zelizer, 2008). Given these circumstances, claiming that Foucault’s work is worthy of inclusion could be taken as contentious for a number of reasons. It is eminently clear Foucault was not a media historian. In fact, a cursory glance at his seminal books, lectures, and essays shows that he never directly turned his gaze upon media technologies or institutions. Nor did Foucault spend considerable time analyzing the past 150 years⁵ – the bread-and-butter period for most media historians, as it saw the rise of modern mass media forms, technologies, and institutions.

However, at least one strain of media history, devoted to media/technology (as opposed to the more prevalent take media/institution), has partially emerged from a Foucauldian inclination (Nerone, 2003). Some contextualization is in order. Nerone argues that two common approaches to media history coalesce around distinct understandings of what media are. One approach, most clearly exemplified by the Canadian Medium Theory School figures Harold Innis and Marshall McLuhan, focuses upon the grand sweep of historical change resulting from the implementation of different media technologies. Nerone suggests media/technology as a descriptor for this approach. The other common strain in media history, media/institution, is the more parochial and involves histories of mass media institutions and their content. This vein mostly produces histories of journalism practices and news organizations, industry-level alterations in the policy and economics of television and radio, the rise and fall of film studios, and the ever-growing importance of advertising. While the media/technology strain is often said to be infected by “technological determinism,” the media/institution wing is filled with the whiggish remnants of a time when great men (*sic*) lorded over history’s conscience and were thought to man (*sic*) the great levers of time’s passage. Nerone sees manageable maneuvers for

escaping technological simplifications via micro histories of specific technologies that dwell upon immediate media environments. Huhtamo and Parikka (2011) suggest that such specificity of historical investigation is what is needed for media archaeology. Further, it denies not only technological determinism, but “construct(s) alternate histories of suppressed, neglected, and forgotten media that do not point teleologically to the present media–cultural condition as their ‘perfection’” (Huhtamo & Parikka, 2011, p. 3). In sum, it is suggested by Nerone as well as Huhtamo and Parikka that we may need micro histories that are careful not to (1) allow media or communication to encompass everything, (2) simply verify in new historical context what Foucault has already “discovered,” or (3) fall back into the grand-narrative trap set by teleology. Who needs to go to the archive if we already know history’s carriage only stops at the doorstep of Foucault’s house of disciplinary order?

Two other concerns regarding Foucauldian historical analysis need to be addressed. One has to do with periodization and the second has to do with the periods in which Foucault’s work was first encountered in English. Treating Foucault as a historian rather than a philosopher or a methodologist leads both to “better” histories that prove him “wrong,” as mentioned, and also the problem of his historical accounts being misread as being teleological and programmatic. Such a misreading can lead to work in media history that simply extends the workings of a particular Foucauldian concept into a new historical period (by necessity a period following those dealt with by Foucault) or applying it to new media technologies with little attention paid to historical and contextual differences. To make matters worse, Foucault describes the emergence of different forms of power (sovereignty, disciplinarity, and governmentality/security/pastoralism) that often are taken to correspond to consecutive historical epochs. Deleuze (1995a, 1995b) further confuses the situation by adding the notion of “control society” as a form. Without belaboring the point, Foucault is quite explicit that no such epochal transformation has been afoot. “We need to see things not in terms of the replacement of a society of sovereignty by a disciplinary society and the subsequent replacement of a disciplinary society by a society of government; in reality one has a triangle, sovereignty–discipline–government [. . .] which constitute from the eighteenth century onwards a solid series, one which even today has assuredly not been dissolved” (Foucault, 1991, p. 102). Deleuze’s description is looser and he describes “old sovereign societies,” “disciplinary societies,” and “control societies,” each with its attendant, and possibly defining, technologies. For Deleuze (1995b), writing at the beginning of the 1990s, the “key thing is that we’re at the beginning of something new” (p. 182). This “new” may see “older means of control, borrowed from the old sovereign societies” (p. 182), brought back into the fold. The degree to which Deleuze’s account is a break with Foucault or an extension depends largely upon whether (a) “control society” is akin to Foucault’s work on security (see especially the first three lectures in Foucault, 2004) and (b) whether a borrowing of the old forms is an example of Foucault’s “solid series” and “triangle.” In either event, applications of a misconceived sequential logic do exist even though it’s quite clear that was not Foucault’s intent.

A second way in which Foucault's work has been dismissed as being insufficient and/or teleological stems in part from the fact that the most prominent glosses of Foucault in English were written well before whole arenas of his work, most particularly his lectures from the College de France, began to appear in print and/or in English. In its worst incarnation we get a Foucault forever relegated to a set of fixed positions that tell us more about the concerns of scholars in the United States and the United Kingdom reeling from the various "posts" starting around 1980 and continuing into the early 1990s than about Foucault the philosopher/methodologist. Such concerns left all sorts of Foucaults (many for dead): a Foucault to forget (Baudrillard, 1977; Virilio, 1986), Foucault without an analysis of the state (Hall, 1980), Foucault the unbeknownst Marxist claiming to be anti-Marxist (Poulantzas, 1979), Foucault the Enlightenment crypto-normativist (Habermas, 1986), Foucault the anti-humanist nihilist (Waltzer, 1983), Foucault the unethical (Miller, 1990), Foucault who forgot feminism (Heckman, 1996), Foucault the postmodernist (Paglia, 1991), and Foucault the modernist (Bruns, 1994). Foucault rather enjoyed such divergent responses to his thought.⁶ Rather than fixing Foucault as a process of recuperation or setting him in his place, it may prove far more beneficial to look at how Foucault's thought animates a range of historical investigations central to the broad definition of media and technology outlined above. Below, four such animations are described. Taken together, they might be considered foundations for constructing Foucauldian media histories.

Friedrich Kittler and Media's Brute Facticity

One scholar who has most fervently pushed the boundaries of a poststructural media history is Friedrich Kittler. His three major works translated into English, *Discourse Networks 1800/1900* (1990), *Gramophone, Film, Typewriter* (1999), and *Optical Media* (2010), can be approached as the first full-fledged attempt to bring Foucauldian poststructural analysis to the historical study of media. The uptake of Kittler in English-language media history has been to this point rather sparsely scattered, a point several scholars have commented upon and tried to explain (Peters, 2008b, 2010; Winthrop Young & Lutz, 1999). In some ways it is rather obvious. Kittler's view of human-technological interaction feels cold and unflinchingly harsh (Wellerby, 1990). Much of the material he worked with was firmly situated in the roots of a German intellectual and literary tradition that is not easily penetrated by those unfamiliar with it (Peters, 2010). Further, Kittler draws not only from Foucault, but also quite heavily from Marshall McLuhan and the French psychoanalyst Jacques Lacan. Ensuring it is even less palatable upon first review, Kittler's fundamental theory of communication is borrowed from Shannon and Weaver's classic "transmission model" which has in the United States been situated as an adversary to critical and cultural approaches following James Carey's 1975 article, "A Cultural Approach to Communication"

(1989). Finally, Kittler's historical teleology may seem problematic. All media technologies are viewed in terms of their perceived similarities with digital media and/or what technological, mathematical, economic, or theoretical elements they added to help "media history culminate(s) in the digital computer" (Peters, 2010, p. 7). Stone tablets, ink quills, and typewriters are necessary, though ultimately failed, attempts to reduce the noise that kept humans from hearing the sirens' call for a digitized world.

Kittler often acknowledges that he borrows heavily from Foucault for his method of historical analysis. It follows then that a discourse network is composed of "the network of technologies and institutions that allow a given culture to select, store, and process relevant data" (Kittler, 1990, p. 369) and that an "archaeology of the present must also take into account data storage, transmission, and calculation in technological media" (p. 369). The "also" here refers to the fact that Foucault's discursive formations "did not progress beyond 1850" and hence paid no attention to the second industrial revolution and "its automation of the streams of information" (p. 369). Thus Kittler seeks to historicize not the processes of meaning making, ideological struggle, or cultural reproduction; rather, it

follows the Foucauldian lead in that it seeks to delineate the apparatuses of power, storage, transmission, training, reproduction, and so forth that make up the conditions of factual discursive occurrences. The object of study is not what is said or written but the fact – the brute and often brutal fact – that it is said, that this and not rather something else is inscribed. (Wellberry, 1990, p. xii)

This poststructural, post-hermeneutic approach to media history appeared as a corrective to the prevailing assumptions and concerns of literary studies, Kittler's initial academic home. The key here for Kittler is not meaning production, the play of ideology, or idealized discourse communities and publics. His maneuver out of the hermeneutic tradition depended upon a decentering of human agency and meaning production via a turn toward Foucauldian discourse analysis and Shannon's model of communication.

A further ingredient for Kittler isn't so much methodological, but rather his dependence upon Canadian medium theory. Combining Innis's concern with space-time bias with McLuhan's "extensions of man," Kittler looks historically upon the specific means by which time shifting and spatial transmission works to extend the sensory, memory, and logical capacities of the human. Whether this be by book, telegraph, television, typewriter, or computer, the brute fact of mediation according to Kittler is best characterized by Shannon's classic mathematical model (much misused and maligned in the US context of its inception) by which messages (or statements) are encoded by a sender, are transmitted through a medium, reach a receiver, and are decoded. Shannon's theory in the hands of Kittler elaborates the processes by which noise is overcome in order that data can be stored, transmitted, and processed. Thus, Kittler's Foucauldian media history, most succinctly presented

in *Optical Media*, is the history of technological achievements in which the camera obscura and lanterna magica are not merely devices that predated photography and film, but rather elements in discourse networks that reshaped how optical data were collected, moved about, stored, and processed. Such media technologies reorient power/knowledge formations as they create new means for knowing and acting upon the world. For instance, the camera obscura functioned mimetically as a means for an understanding of human optics, perspective, and even ballistic predictability. Further, from such a vantage, media are certainly “extensions of man,” but only insofar as the “man” in question was never an *a priori*, but rather an always-already extended product of discourse and technology. Thus, McLuhan’s humanistic sensibility gets reworked.

There are several more specific takeaways from Kittler’s work for thinking about Foucault and media history. First, the study of discourse as it relates to media looks very different from what Kittler (2010) derides as a “trivial, content-based approach to media” (p. 31). Rather, discourse relates to the networks of associated technologies and statements which organize what can be said (data-knowledge), where and to whom it is said (transmission-power), and what can be made with such statements (processing-power/knowledge). The importance of media technologies is that they changed such dynamics. It made the visual and auditory realms mechanically capturable, storable, searchable, transmittable, and processable. It combined the time shifting of memory or print with analog data capturing that did not have to pass directly through human observation, but rather through mechanical means of production and processing. Cameras may have first depended upon human hands to be made operable, but once freed from such constraints they are capable of capturing data regardless of intentionality, human agency, or the constraints of meaning making. Much meaning will be made and humans will enact agency via the camera for all sorts of intent, but the pivotal issue for Kittler is how it transforms the capturing of data. This is one aspect of the facticity of Kittler’s media analysis. The world was being newly inscribed, not by human hands writing, chiseling, or making marks on papyrus, paper, or some other surface (what Kittler refers to as the artisanal stage of media production), but rather through apparatuses that combined chemistry, mechanics, and optics.

Kramer suggests that Kittler’s media history is fundamentally about both technologies and institutions:

it is necessary to note that there are not always data, on the one hand, and then, on the other hand, the media that are concerned with the data. It is far more the case that media are the production sites of data. These production sites are discourse systems, the networks of techniques and institutions that preprocess what will even be considered data in a given epoch. (Kramer, 2006, p. 98)

Here we have one of the possible means for overcoming the divide that John Nerone sees in the field of media history between examining technologies and institutions. We will return in the section on governmentality to how a Foucauldian media history

could be used to bridge such a division. For now, however, because Kittler's historical accounts are so attentive to the inner workings of technological development, we are given a view into the institutional laboratories from which they are formed. From such a vantage, specific techno-mechanical, biological, chemical, electrical, and human assemblages are the actors, while institutional demands and physical limitations are the well-lit stage.

Most central to a Foucauldian media history may be the question of knowledge production and the games of truth that are increasingly played out via media. Media are fundamental to knowledge production; from how data are collected, how they are made visible, their form, the life of their existence, their degree of malleability, the extent to which they can be translated from machine to machine to machine, and ultimately how they can be processed to make things happen. In the end, for Kittler, the digitalization of data, of the world, of knowledge, makes all media "the same." From such a vantage, the effects on the continuing production of knowledge have clearly not fully come to be understood. In terms of a Foucauldian media history, the project of making sense of how media have altered the production of knowledge that organizes how the world is known, processed, and acted upon has barely begun. Yet what is needed isn't merely the Foucauldian project of archaeology, of discourse, but rather of genealogy.

Kittler's Foucault needs to be complicated by power relations to counter what Peters (2010) calls his "disdain for people, or more specifically, for the category of experience" (p. 5). In particular, I would like to imagine that many of Kittler's insights would not lead to categorizing humans into what emerges in his work as (1) the geniuses of scientific invention and philosophic understanding or (2) the great masses of unnecessary and powerless "so-called humans" who fail to populate his histories.⁷ Rather, a Foucauldian media history might focus not only upon the early Foucault of knowledge production and discourse networks with their attendant ruptures, but more so on Foucault's later work on power and subjectification. Our understanding of the relationship between subject formation and media would become richer and more complex, not flatter and reductive. This would involve not only focusing upon Kittler's favored loci of struggle, nationalist scientific competition, and war, but rather the messiness of struggle over epistemology and invention that take place in local contexts of lived experience. The give and take between from-on-high and down-low has been a difficult relationship to chart. The archive favors the memory, and hence the perceived power, of those who could write their thoughts, file their notes, and mail in their patent formulas. At the very least we know that the creative power of "the people" to create their own discourse networks has been alive and well for a very long time. Foucault summed up the two approaches in his 1977–1978 lecture series *Society Must be Defended*: "To put it in a nutshell: Archaeology is the method specific to the analysis of local discursivities, and genealogy is the tactic which, once it has described these local discursivities, brings into play the desubjugated knowledges that have been released from them" (Foucault, 2004, pp. 10–11). So where might we find such release? We can start up high, before moving below.

Philosophy of Science and Instrumentality

In part, a poststructural Foucauldian media history would investigate, if we follow the lead of Friedrich Kittler, the specific formation that allows particular statements to be made. I want to work this terrain by looking toward the so-called Stanford School in the philosophy of science for insight into two interrelated concerns. First, as part of their work in the history of science, they have often foregrounded the apparatuses of investigation, scientific instruments. Such histories provide useful insights for media history not simply because these instruments look an awful lot like what are often thought to be media technologies. Take, for instance, the X-ray machine that takes photos of an invisible interior or better yet various forms of radar developed to “see at a distance.” Radar combines radio-wave transmitters and receivers, data processors and amplifiers, and cathode tubes with a projection screen similar to that of early television. Second, far more than media historians, philosophers of science tend to be interested in epistemological and ontological concerns. The scholars whose work I will be referencing most frequently, Lorraine Daston and Peter Galison, to lesser and greater degree profess a debt to Foucault’s work and often follow his methodological lead in their historical analysis. Their insights regarding scientific instruments in their historical and epistemological dimension, I will argue, are widely applicable to developing a uniquely Foucauldian media history.

Before beginning in earnest, it is useful to note that there is a rarely stated assumption that media studies, even those that focus on technology, should focus on *mass media* technology. Hence, studies of instruments, rather than “media,” which accomplish similar goals (McLuhan’s [1964] “extensions of man”), but aren’t viewed in terms of consumption, but rather in terms of production, tend to be overlooked. Yet, even from the comfort of my desk chair (a place of production and consumption), I see numerous such media/instruments: an electronic meat thermometer used for “feeling at a distance” (impaled into the untouchable interior of the roast in the oven), binoculars and spectacles for “seeing at a distance,” whether it be birds perched atop a distant cell-tower or the small print in John Berger’s *Ways of Seeing* (1973), and the remote control for “manipulating at a distance” the volume of my stereo to reduce the noise that keeps me from completing my thought. Are other instruments, the piano and saxophone, media technologies? I can’t see the speakers around the corner that seem to be transmitting sound waves that result from the transistor tube-magnification of electrical signals produced by the interface of the vinyl LP *A Love Supreme* (Coltrane, 1965) and the turntable/tonerarm/cartridge apparatus. Would it matter if it were instead a real person interfacing with molded brass to convert breath and finger strokes into similar sound waves? Would the definition be further complicated if the range of my ears were extended by an electronic hearing aid? The issue for media history is not simply the replacement of old forms (oral, print, mechanical) for new (electronic, digital), but also determining the cut-off point used to define media from something else. For Marshall McLuhan (1964), clothes and cars are media.

Peter Galison may be best known for his book *Einstein's Clocks, Poincare's Maps: Empires of Time* (2003), which outside of John Peters's reworking of Carey's classic essay "Technology and Ideology" and Chris Russill's (2009) work on weather and television, doesn't seem to have had much effect on media history. Yet, in his work, Galison provides a clearly stated and thoroughly Foucauldian-inspired model for doing media history. I'll let a summary passage of his speak to this:

On one side lay the vast modern technological infrastructure of trains, shipping, and telegraphs that joined under the signs of clocks and maps. On the other a new sense of the mission of knowledge was emerging, one that would define time by pragmatism and conventionality, not by eternal truths and theological sanction. Technological time, metaphysical time, and philosophical time crossed in Einstein's and Poincare's electrically synchronized clocks. Time coordination stood, unequalled, at that intersection: the modern junction of knowledge and power. (Galison, 2003, p. 47)

It is evident that Galison's concern here is with the control of time over vast distances, a fundamental concern of media history. He presents it here in terms of the institutional, economic, and epistemological demands placed upon the production of knowledge that are implicated in the relations of power that were newly organizing the world.

While Galison's commitment to unearthing power/knowledge relationships are clear, insights from other work help fill in how media might play a part in understanding the power/knowledge/subjectification process. First, Galison provides a vocabulary for attending to the "Conditions of Instrumentality" of what I'm calling media instruments. Second, in his work with Lorraine Daston, *Objectivity* (Daston & Galison, 2007), a model for investigating the co-production of instruments and ethical forms of subjectification is developed via a genealogy of the scientific invention of objectivity. Taken together, these insights provide a means for media historians to heighten their sense of the epistemological centrality of media. There are huge perceptual and cognitive effects resulting from our forms of mediation. Peters (2008a) cleverly points out that our media determine our very perception of the past, our sense of history and our ability to create it, and Lisa Park's (2005) investigation of how satellite imaging technology created new means for studying ancient Alexandria proves the case. As such any media history is itself dependent upon the media available for accessing, retaining, processing, and representing the past. But this is merely one of myriad ways in which academic, professional, institutional, and vernacular forms of knowing are hugely dependent upon and altered by the media forms through which we experience and interact with the world. Mediation is the process by which we come to know the world. Further attention to epistemological concerns would demand investigating how instruments that mediate our engagement with the world are often devised to overcome a perceived epistemological limit or delve into an arena of methodological darkness. They are created to overcome the limits of human perception, representational acuity, and processability. These two broad epistemological concerns, as effect and as prime mover, move us toward a consideration of Foucault's

concern with the historically contingent possibilities for knowledge production. Thinking of media “instrumentally” furthers such a project.

Galison (1997) extends Foucault’s notion of the “conditions of possibility” into the realm of scientific instruments in his account of “conditions of instrumentality.” In the *Archaeology of Knowledge* Foucault attempted to describe how certain statements came to be used as opposed to others. He asked what conditions needed to be in place to make it possible to describe the world in a particular way and be able to claim the description was true and accurate. Galison extends this sensibility by focusing attention upon a similar co-dependent process. These conditions address (1) how specific instruments (media) need to be present to make particular statements or discursive utterances possible and (2) that only under certain conditions can particular instruments come into being and/or seem necessary in the first place. Simply, “what can and should be made representable?” In large part the criteria determining the use of instruments accord with the degree to which such forms of instrumentality produce or reduce “noise.” Thus a communications sensibility orients the “conditions of instrumentality.” In a recent article on imaging technology in dentistry it is argued that Foucault’s assessment of a “unified discourse” in medicine is up-ended by the sophistication of these new instruments and by the distributed care given by a host of medical practitioners (Bleakley & Bligh, 2009). I would suggest that attending to these changes according to their “conditions of instrumentality” and the attendant forms of distributed subjectification is precisely the sort of analysis needed. The necessary fidelity of an instrument is of course historical and flexible, but a statement about its fidelity is determinative of what sorts of discourse are recorded, verified, processed, and disseminated. In other words, there is no overarching schema for determining the acceptability of an instrument’s clarity, but a concern with clarity conditions such use and helps configure who uses such instruments. Jonathan Sterne’s *The Audible Past: Cultural Origins of Sound Reproduction* (2003) is a significant investigation into such “instrumentality” providing for example an analysis of “a new medical semiotics” (p. 128) in which “doctors could hear what they could not see” (p. 127).

Galison wants to move beyond Kuhn’s model of wholesale paradigmatic change to a model that is more complex, more nuanced, and pays attention to both the work of translation (a linguistic communicative problem) and decontextualization (how do things get translated *and* newly “instrumentalized”). As Agamben (2010) also notes, Foucault desires in the *Archaeology of Knowledge* to move away from the language of the paradigm to the episteme; precisely the move that Galison wants to make. So what can we take from this that is “multifold” for the study of media history from a Foucauldian perspective? First, that in experimental (as well as the theoretical) sciences, the production of discourse is dependent upon the “possibilities of instrumentality.” The mediating technologies that respond to and produce observable representations of physical phenomena are integral to an understanding of media, as are the technologies of reproduction and dissemination. (Kittler’s camera obscura and lanterna magica, for instance.) In other words, all knowledge is dependent upon forms of technologically mediated discourse. Whether this runs through the eye

(observation) and the hand (a picto-drawing or lab notes) or digital representations resulting from sound waves (3D ultrasound), the process of mediating experience into discourse (statements that make a claim on the world) is a technological process. So any study of discourse needs to attend to what Galison calls “possibilities of instrumentation.” I might further suggest that any study of media history should also. The kinds of statements that could be inscribed at any given moment depended upon the forms and types of instruments present, available, and in use. The world has become representable and knowable through media technologies.

Part of the etymology of the term “instrument” is that which is used as an agent in a performance. The reason the term “media instrument” holds such potential value as opposed to “media technology” is that “instrument” already implies some effect, some agency, over the very possibilities for representing and processing the world into data. Instruments are not merely facilitators or tools used at the behest of human agency. Further, we might take up the relationship developed by Galison (2002) and Daston and Galison (2007) between science, instrumentality, and subjectification. Gallison (2002) looks to the contingency of authorship in physics. There he begins to develop an analysis for the examination of “technologies of a scientific self.” Distributed authorship is one technological aspect to a collective form of scientific subjectivity, different from other sciences and practices of authorship. Physics projects modes of subjectification.

More fundamentally, Daston and Galison (2007) argue that the formation of what has come to be understood as scientific objectivity is largely the result of how new instruments for producing and representing data are intertwined with what they call “epistemic virtues.” They work through three differing forms of such virtue: truth-to-nature, objectivity, and trained judgment. What they all share is a belief that instruments and discursive rules exist which when properly used can overcome subjectivity, with all of its misperceptions and perspectival limitations. Scientific atlases, filled with hand-drawn or mechanically produced images, charts, x-rays, echocardiograms, and the like, have all been used to teach the proper means for seeing and thus knowing the world. “Once internalized by a scientific collective, these various ways of seeing were lodged deeper than evidence; they defined what evidence was” (Daston & Galison, 2007, p. 369). Hence, an ink-fed needle marking a continuous line that jumped vertically up and down across a series of predetermined horizontal lines became the means for objectively representing and hence knowing the relative health of the cardiovascular system. Yet, a trained reader, ethically committed to an epistemological framework, needed to be simultaneously produced to integrate these markings into an institutional network that could fix this heart so it could later produce a healthy chiaroscuro of markings that fell within the limits of the norm. This co-dependent relationship between technology and subjectification determines what technological forms get developed for use while simultaneously legitimating an understanding of the world that is fundamentally mediated by those same technologies. In *Histories of Scientific Observation* (2011), Lorraine Daston and Elizabeth Lunbeck provide a summary of how such processes work together.

“Observation educates the senses, calibrates judgment, picks out objects of scientific inquiry, and forges ‘thought collectives’” (p. 1). It has increasingly done so by way of technological instruments. What we might call media.

Cultural Studies and Media Governmentality

In the early 1990s Foucault’s work on governmentality first began to appear in English.⁸ One area of scholarship to quickly struggle with the importance of this work was cultural studies. Most fundamentally, Tony Bennett (1992) argued that culture, the foundational concept of the field, must be newly theorized. No longer was culture only to be understood through two prominent modes: (1) the anthropological sense of a “whole way of life” and (2) Matthew Arnold’s sense of culture as the best and brightest products of humanity or its opposite, the lowbrow “popular” forms. Rather, culture was also to be understood as an arena for the shaping of conduct. Understanding in this form derives from *agriculture* and acknowledges that the same sort of attention, care, and cultivation that farmers invest in their crops is akin to how through cultural forms and processes the conduct of individuals and populations alike could be shaped and groomed by governing institutions and agents. Such a redirection demanded new methods and new political commitments. The focus was no longer to be so text oriented and hence cultural politics couldn’t be played out merely via ideology critique.

While it was not explicitly stated as a directive to conduct historical research, much of this work in cultural studies has nonetheless been guided by historical investigation. In fact, Bennett’s first full-scale project in this vein was suggestively titled *The Birth of the Museum: History, Theory, Politics* (1995). At the crux of Bennett’s historical analysis is the argument that cultural institutions, public museums for instance, developed out of a commitment to reshape an unruly mass into a better-mannered and productive population. For Bennett, the British Museum is a political technology of governance, culture its primary tool. Others have taken up this work on the museum in other national contexts, for instance Mary Coffey (2012) examined the formation of the modern twentieth-century state museums in Mexico as a mechanism for the creation and distillation of an explicitly modernist Mexican citizenry built upon a manufactured sense of shared culture and history. Miranda Brady’s (2007) investigation of the National Museum of the American Indian looks to how museums are increasingly infused and integrated with media as a mechanism for extending and updating their governmental logic. What this and other relevant work shares is a historical examination of institutionally embedded uses of communicative, cultural, and media practices to shape conduct and create ethical subjects.

For instance, in *Culture and Governance: The Emergence of Literary Education* (1988), Ian Hunter examines not the book as technology *per se*, but rather the teaching of literature as an example of a technology of governance that uses culture, literary

education, as a primary tool. This sort of historical specificity moves beyond the tracing of circulation as a measure of a medium's effectivity. Rather, it acknowledges media or culture as technologies of governance, and not simply as a text or product imbued with meaning, and acknowledges that institutions try to accomplish goals through the use of media as technologies for governance. This is not a return to "uses and gratifications" models, as the purposes are often institutionally inscribed and defined. Hunter argues that the primary reason for the ascendancy of teaching literature in the nineteenth century was to transform a particular class of reading subjects. The extensive use of the novel in the humanities was due to its imagined role as an ideal means for working upon the intellectual and ethical dimensions of a developing professional middle class. Literary books became a technology for what Nicolas Rose (1999) has termed governing souls.

Similarly, Greene and Hicks's (2005) Cold War-era genealogy of the practice of switch-side debating worked to develop an idealized form of ethical citizenship through the circulation of specific forms of speech practices that articulated democratic decision-making to the ability to rationally take the position of "both sides." Greene and Hicks suggest that these idealized protocols for communication informed wide-scale acceptance of liberal citizenship. Hence, teaching debate and organizing contests were said to not only provide a set of skills for speaking in public, but a set of criteria for judging good arguments from bad and faulty reasoning from sound. Further, debating both sides was imbued with a personal ethic that idealized a liberal market model of citizenship as a means of countering state socialism. More broadly, Greene (1998) has argued that the field of rhetoric, often housed along with media studies in communication programs, needs to examine how the practices and norms which it proposes are attentive to the sorts of citizen/subjects that it has historically worked to create. We can easily view these examples as genealogies of communicative, if not always media, practices in their functioning as institutionally specific technologies of governance.

While I do not want to conflate cultural studies with media studies or communication with culture, there are good reasons for looking to these areas for guidance. Much historical research on media as technologies of governance has begun to appear over the last few years. I turn again to the work of Greene (2005), in this case a study of the use of film by the YMCA from the late 1910s to the 1930s. Greene sees his work as a means for investigating the "relationship between communication technologies and the logics of social welfare" (Greene, 2005, p. 21). Further, he is invested in doing historical analysis that bridges the technology-institutional divide: "unlike institutional approaches that foreground the political economy of film and critical traditions that focus on the film text as an object of ideological representation, this paper locates the YMCA's film program within a cultural problematic of liberal governance: namely, how communication technologies shape conduct" (p. 21). Greene describes how the YMCA built a vast network for distributing and exhibiting film that worked in conjunction with viewing guides, discussion sessions, and educational programs to help shape the conduct of industrial workers, many of whom were newly

arrived to the United States. Such an approach articulates not only how media technologies can function as part of a technology of governance, but that technology works only insofar as it is situated in and by institutions. Kalen Churcher's (2008) scholarship on the history of inmate-produced media specifically attends to how media production, as opposed to reception, can also function as a technology of institutionally specific governance with the aim of providing new modes of prisoner reform.

James Hay has provided several examples for how to historicize the role of television in more generalized modes of governance, in particular those related to mobility and the home (Hay, 2001, 2003, 2004) and as part of a means for configuring media as necessary elements in the history of urban renewal plans (Hay, 2012). Laurie Ouellette in her own work (2002) and along with Hay (Ouellette & Hay, 2008) has also provided historical detail to television as a tool of governance. Ouellette's work on PBS specifies how television has been imagined and struggled over as a mechanism of governing through a unique blending of private and state initiatives regarding good taste, educational programming, and cultural uplift. While Hay and Ouellette's more recent work is not a historical account *per se*, as it looks at the recent formation of reality TV, the historical trajectory they chart situates television across "three historical conjunctures." Each conjuncture describes television as a changing technology in a particular governmental arrangement. In its early broadcast period, television was situated in a series of ongoing debates about how to best serve the "public interest" through the perceived freedom of private industry in contradistinction to Nazi Germany and the Soviet Union. Further, "radio and television mattered as technologies of territorial/global expansion, mass suburbanization, market growth, and mobility" (Ouellette & Hay, 2008, p. 25). The second conjuncture is best understood in terms of a discourse on diversity that would mitigate the "great wasteland" of private television product. It saw the role of government as regulating an idealized balance between corporate management's ability to create popular programming, but directed toward sensibilities of cultural uplift and good citizenship. Out of such debates eventually arose the Corporation for Public Broadcasting and PBS. The third conjuncture witnesses a reinvention of television through cable and niche marketing as a means for lifestyle programming and networks that reorient the role of television as a technology of self-actualization. Hay and Ouellette's work on the history of television provides a model for rethinking the history of media in terms of the interrelated potentiality of technology and institutions (government, private, and otherwise) to be used for the governance of populations in ways that move beyond beliefs, attitudes, and effects. Their work has recently inspired other genealogies of television such as Shayne Pepper's (2011) history of HBO as a pseudo-replacement for PBS, particularly in its role in governing the AIDS crisis.

One criticism of work in governmentality is that it tends to be overly institutional insofar as the governmental goals of institutions are treated as if they automatically produce their desired and intended effects (Bennett, 2003). In part this is to say that the workings of culture, from below, are not taken into account, thereby ignoring all the findings of subcultural analysis and audience studies that began in the 1970s

and continues to this day. It is in essence to ask about the people, about the public. Don't they have some agency to resist, co-opt, or opt-out of such governmental arrangements? One confounding conceptual point here is that for Foucault there is an epistemological shift in which people, the masses, or a state's or king's subjects began to be newly understood as a "population" during the nineteenth century; something which can be studied, experimented upon, and prodded toward new directions of conduct. The point isn't merely semantic. One provision of these histories is that they are first and foremost histories of governmental rationality. They are generally not histories from below. The status of the audience or the public is being reanimated in interesting ways by two other Foucauldian approaches.

The necessity of the field as currently constituted through concerns over the public, ideology critique of representation, ownership, audience studies, and many other key concepts looks very different when viewed through the Foucauldian post-structural lens; different even than the merely disciplinary Foucault. In fact, much work has been done to upset the taken-for-granted nature of the field's key terms. Further, this work is often historical in nature. Specifically poststructural Foucauldian work in these areas weakens the always-alreadyness of such terms as the public or the audience. As Russill (2008a) shows, publics result from specific problematizations. They are manifested through truth claims (knowledge) that invoke the capacities of peoples (power) to be affected by some phenomena. "Problematization" is a term Foucault coined to exemplify the process by which something comes to be thought of in terms of a problem to be solved through analysis and which is caught up within contested claims of truth and falsity. Similarly, audiences are neither publics, nor even a group of people who share a common discursive experience; rather, they are an effect of knowledge claims about the affectivity of mediation upon groups of people (Bratich, 2005). Or to put it differently, the term "audience," within the field of media studies, for media institutions, and for political agents, invokes a whole set of beliefs and assumptions about how people respond individually and collectively to mediated communication (scientifically informed and otherwise). Such assumptions set in motion how media industries are organized and what sorts of content and hardware are produced to elicit the desired effect upon or through an audience. Various iterations of the audience, often simultaneously at play, result from epistemological assumptions regarding cognition, social action, affect, consumption habits, and so forth. Audiences are not merely studied; they are both figuratively and actively produced via analysis and experimentation. This does not assume that such prodding, dissecting, organizing, and directing produces the desired effects. It does mean that the ontological, epistemological, and methodological underpinnings that guide academic, economic, governmental, and technological organization of media practice have effects.

Historical research that simply looks at the rise of disciplinarity or surveillance would not necessarily approach the public or the audience in poststructural terms. Rather such work tends to approach audiences as a fixed entity that are increasingly locked into or made participative members of networked surveillance practices. The

public may more broadly be conceived in such terms, or it may be looked at in terms of its relative acceptance or rejection of surveillance practices. In either event, the conceptual nature of audience or publics (or even “the subject”) may very well be left outside analysis. This is just the sort of analysis that Nerone sees as being overly deterministic.

Agamben and the Apparatus⁹

This final section draws upon Foucault’s description of the apparatus and Giorgio Agamben’s extended discussion of the term. The concept of the apparatus can help unite a number of the themes developed in previous sections. It provides another means for bridging the divide between media technology and media institution, as it involves the interdependent relations between power, knowledge, and subjectification to which I have been gesturing in much of this chapter. By necessity such an approach will involve looking to how various competing and overlapping institutions work to develop, organize, dominate, control, and disseminate the uses of various media technologies. Further, as we saw in the histories of scientific instruments, the possibilities of instrumentality also necessitate the formation of specific technological subjectivities. Agamben suggests a similar form of subjectification results from more traditionally recognized media technologies. In terms then of media and instruments, we can investigate the necessarily historical production of “subjectivities” coinciding with the use of specific technologies *and* we can look to how users become “objectified” through the accumulation and generation of data/knowledge facilitated by such technologies. This double articulation is central to Foucault’s theories of the subject and power, as will be elaborated below.

In *What is an Apparatus?* (2009) Agamben untangles how the concept “apparatus” works to tie together a number of interrelated concepts in Foucault’s thought. More profoundly, Agamben extends the notion of apparatus to encompass all such activities and institutions intended to alter (or, in more Deleuzian terms, capture) human behavior and thought. He even provides two “media” examples of apparatuses, the cellular telephone and the television, which prove fruitful for our concern here with media history. Foucault described the key elements of the apparatus (*dispositif* in the original French) in an interview from 1977, from which Agamben draws heavily:

What I’m trying to single out with this term is, first and foremost, a thoroughly heterogeneous set consisting of discourses, institutions, architectural forms, regulatory decisions, laws, administrative measures, scientific statements, philosophical, moral, and philanthropic propositions – in short, the said as much as the unsaid. Such are the elements of the apparatus. The apparatus itself is a network that can be established between these elements [. . . and] has as its major function the response to an urgency [. . . it is] precisely this: a set of strategies of the relations of forces supporting, and supported by, certain types of knowledge. (Foucault in Agamben, 2009, p. 2)

Here we see a few key elements of the apparatus. It is strategically organized to address a perceived problem or urgency. It works as a network of interested and associated forms of knowledge that are directed toward creating strategic administrative and technological “solutions.”¹⁰

What does Agamben add to Foucault’s understanding? Agamben proclaims:

I shall call an apparatus literally anything that has in some way the capacity to capture, orient, determine, intercept, model, control, or secure the gestures, behaviors, opinions, or discourses of living beings. Not only, therefore, prisons, madhouses, the panopticon, schools, confession, factories, disciplines, juridical measures, and so forth (whose connection with power is in a certain sense evident), but also the pen, writing, literature, philosophy, agriculture, cigarettes, navigation, computers, cellular telephones and – why not – language itself. (Agamben, 2009, p. 14)

For Agamben, then, the range of apparatuses is vast and he might draw fire for being so broad as to not provide any useful specificity for analytic application. However, a second necessary element in these compositions is that “Apparatus, then, is first of all a machine that produces subjectifications, and only as such is it also a machine of governance” (Agamben, 2009, p. 20). Thus we can see that cigarettes, for instance, are the result of a complex of forces and materials that have for a very long time been at work creating the subject position “smoker.” This is both a means of capturing one’s time, resources, and desires as well as a biopolitical attempt to objectify the smoker, turn them into data, in order to know them, reform them, and make them “unsmoke.” Agamben’s qualification that subjectification is central to the apparatus goes a good way in narrowing and clarifying it as a useful concept. As media scholars we still may question why cellular telephones or pens should be considered an apparatus. We don’t speak of the “cellular subject” or “cell phoners.” Do we need a more nuanced means for thinking about the apparatus as it relates to media history?

Foucault (1982b) provides some insight into how communication forms an integral part of an apparatus when answering the question “How is power exercised?”

No doubt communicating is always a certain way of acting upon another person or persons. But the production and circulation of elements of meaning can have as their objective or as their consequence certain results in the realm of power; the latter are not simply an aspect of power. Whether or not they pass through systems of communication, power relations have a specific nature. Power relations, relationships of communication, objective capacities should not therefore be confused. This is not to say that there is a question of three separate domains [. . .] It is a question of three types of relationships which in fact always overlap one another, support one another reciprocally, and use each other mutually as means to an end. (Foucault, 1982b, pp. 217–218)

How then does communication and mediation work in terms of power? And wouldn’t nearly all dimensions of social activity be subsumed under the banner of the apparatus if even language (as Agamben suggests) is an apparatus? Brief rumination upon

Agamben's examples and Foucault's description of power and communication would lead us to see that media apparatuses are immediately composed of signs, signifiers, and technologies of inscription, collection, and processing (following from Kittler). Further, we would need to provide insight into the power relations enacted through media and media that are structured by power relations.

We could think of a "Stop" sign or a book in such terms. They are signifiers or sets of signifiers as well as technological elements created within vast infrastructures used to guide and direct thought and action. They produce meaning and are the product of labor: creative, affective, manual, and technical. They are technologies each with their own histories and institutional embeddedness. In the same way that Foucault (1977) read Bentham's diagrams and descriptions for the panopticon and "read" the panoptic prison itself, we might imagine reading the history of infrastructure and architecture of media technologies for their power effects, for an understanding of how the movement and mobility of signs, products, and people work to uphold power relations, to see how they form and deform subjects. If we took Agamben's (2009) example of television, we would need to look beyond the content of television – as Raymond Williams (1974) so ably demonstrated and Hay (2003) extended – to understand how a specific formation and organization of television functions as one element in a larger apparatus that he calls "mobile privatization." As Hay explained: "Williams described television as a technology whose utility and effectivity can only be understood with considerable difficulty as part of a widespread 'social investment'" (Hay, 2003, p. 169). Similarly, understanding the cell phone as an element in a widespread social investment would entail more than Agamben's (2009) suggestive assessment that "gestures and behaviors of individuals have been reshaped from top to toe by the cellular telephone" (p. 16). Further, "He who lets himself get captured by the 'cellular telephone' apparatus – whatever the intensity of the desire that has driven him – cannot acquire a new subjectivity, but only a number through which he can, eventually, be controlled" (p. 21). For historians of media, Agamben's analysis can only seem hasty and any significant account of how one is "captured" would need to be much more nuanced than Agamben lets on. For instance, the cellular telephone is far more intricately entwined in a much longer history regarding the governance of mobile media. Further, the cellular telephone, as such, is itself something of a historical anachronism. It is unclear whether one can even purchase a device singularly devoted to making telephone calls, as Henry Jenkins noted in his 2005 book *Convergence Culture: Where Old and New Media Collide*. Rather than taking aim at Agamben directly, I prefer to use his outline of the apparatus as suggestive of the general direction one might take when setting one's sights on media history. In this spirit, a brief rumination upon an earlier form of mobile media, citizens band radio, will be used as a more extended example than provided so far in this chapter.

When I began historical research on citizens band radio several years ago the first major hurdle was figuring out what it was that I was actually researching. What was my archive? Given that there was no commercial content and that conversations were fleeting – mandated by FCC regulation to last a maximum of five minutes – the

historiographic issues were obviously troubling. Such obstacles could also be used to explain the very limited number of academic studies that had been done at the time of CB's peak of popularity from the mid-1970s through the early 1980s (I was never able to locate more than a half dozen), when as many as 20 million CBs were said to be in use. In part this was because the assumed objects of study were the utterances and lingo that marked the use of CB. Yet, without extensive recording technologies and the technological ability to eavesdrop on a nearly limitless set of conversations and commands in mostly moving vehicles, there were virtually no collections of any of these conversations from which to begin a historical investigation.

Modeling an approach built on the notion of the apparatus would suggest recognizing the non-centrality of media as the specific object of historical investigation, while recognizing media as central to holding together nearly any given apparatus. They are never the entire answer – nor thereby their content the whole archive. But they are always part of the answer. Thinking in terms of the apparatus keeps this tension in sharp focus. Further, the focus upon the role of media in the construction and maintenance of various apparatuses is not necessarily merely ideological or “cultural,” if we think of the cultural as the realm of meaning making. Rather, taking a well-understood division in the field, it would entail studying media history in terms of both transport and culture (Grossberg & Carey, 2006). It would recognize that the historical importance of media (as in mediate, “to bring together”) is manifest in both realms. It works to maintain culture over time (cultural) and to maintain the networks and infrastructures that facilitate the movement of people, goods, and cultural artifacts across space throughout time (transport).

Thinking in terms of CB as part of an apparatus of “mobile privatization” or “disciplined mobility”¹¹ allows for different sets of questions to be asked by which the content of CB conversations, though important in terms of their general uses, is not central. Let me clarify. Rather than look to the specifics of any given conversation, we might begin with the rules for conversations (the brute facticity of what can be said) in general and CB's imagined use as first outlined by the FCC. It also would mean recognizing that such determinations changed over time and were struggled over by numerous invested parties. In terms of the apparatus we would need to examine which experts were able to make truth claims as to how the population could conduct itself with the aid of CB and enable the conduct of others through the proper use of this technology.

A key element in such an investigation entails the official debates over who was granted jurisdiction and how such a determination was made. It also involves understanding how their knowledge claims are legitimated and hence used to organize formations of the apparatus. For instance, CB was initially seen as a useful business tool for the dissemination of important information, particularly in the form of urgent messages. As such it was most often used in the management of fleet mobility by businesses or as part of rapid response strategies of governmental agencies such as the Coast Guard. Its range of use was relatively short, but in the case of managing

a fleet of taxis or local deliveries it was eminently useful in monitoring and managing the movement of labor and product.

The FCC is not the be-all and end-all for such considerations, but it is the policy-making body with jurisdiction over CB in the United States. However, this does not mean treating it merely as the police or policy arm of government. It means to take seriously its ability to make truth claims about a specific realm of activity. When Mark Fowler famously compared televisions with toasters, TV became a different technology. Literally. It became part of a different apparatus. It was now governed and expected to be understood – known – through a different rubric. As such the set of social and material relations in which it was a part were reset, rearticulated. CB went through such a transformation as well, though not because of a proactive change on the part of the FCC, but as the result of new cultural uses – aided by technological and economic changes – which could not have been imagined by the FCC. Within the power/knowledge relations, the FCC became the relevant institution that determined how CB should be understood (knowledge) in part as the result of the ongoing collection of data related to its popular use *and* because it was the governing body that licensed and monitored specific cases of CB's use. The FCC also determined the fine structure for infractions and assessed them. Thus it set the stage for the proper use and surveillance of CB and organized its use into a rubric of penalties-based governance.

As those who study technology (media in particular) know, the original intentions for how a technology is to be used rarely play out as hoped. In particular, the state's use of such technologies for policing and military advantage, as well as the specific applications for advancing business interests, are often eclipsed by other uses. This was exactly the case with CB. Military forces, policing agencies, and rapid response civil services such as fire departments and ambulance services initially and most extensively used two-way radio, of which CB is a subset, as it developed for land use. This state appropriation of two-way radio's potentiality was eventually spread out into the realm of business, as with the fleet management already mentioned, and finally into the public via the *citizens* band. Yet even there it was envisioned as a measure to extend its commercial uses and an extension of the state's ability to surveil the road system and promote motorized safety. (For a lengthier history of CB, see Packer, 2008, Ch. 4.) It was never seen as a carrier of culture. The content of CB was to be free from "idle chit-chat." However, this changed radically beginning in 1973 when truckers began to use CB as their communications tool for organizing political protest and building community.

While it is not my intention to retell this historical shift in CB use, I do want to suggest a few ways of thinking about CB as an element in two apparatuses, mobile privatization and disciplined mobility. Thinking about CB in terms of mobile privatization would mean asking how CB alters the key triumvirate in Williams's account of the primary public and private spaces that are traversed in a car-oriented suburban lifestyle: the home, the automobile, and the workspace. For Williams the automobile functions as a private space that extends the possibility for an increasingly private

domestic life. It bridges, or brings into possibility, the domestic sphere of the home and the public sphere of labor. Television similarly bridges the public and private by bringing the outside world into the home. It links the home to the local community, the nation, and the world. Similarly, the transistor radio brought the outside world into the relative privacy of the automobile, making the car a rolling version of the living room. When CB entered the private sphere of millions of automobiles in the mid-to-late 1970s, this equation came under attack. Suddenly, in-car radios were no longer only mass media, but rather a two-way form of broadcast. Conversations could be struck up, debates were had, and information was freely and collectively shared. New forms of culture and community were nurtured and the possibility for a non-commercial form of amassed media emerged. In other words, the private sphere of the automobile became a public sphere that could be and was used to initiate political protest and to foster non-commercial forms of (mass) communication.

CB also emerged as a force within the disciplined mobility apparatus. In its simplest terms, disciplined mobility can be understood as the orchestration and governance of technologies of autonomous motorized transport (primarily automobiles and motorcycles) according to the seemingly competing logics of freedom and safety into a well-disciplined machine for the efficient and productive movement of peoples and goods. While disciplined mobility depends heavily upon proper forms of training and the panoptic presence of police surveillance, CB was used to provide heroic tales of danger and the means to produce a counter-surveillance machine. While two-way radio on the road had historically been monopolized by the state and commerce, the public use of CB allowed for new games of truth to commence and for new relations of power to manifest.

One such power dynamic featured a struggle between the CB citizenry and state policing. A whole host of low-budget films and popular songs told just such stories. They depicted how automobile drivers are situated in a struggle over the validity of motorized safety and what role they played within a vast surveillance apparatus. Should drivers extend the state's ability to monitor motorized behavior by using CB to snitch on errant drivers or should they work together to inform each other of police whereabouts, thus blunting the element of surprise necessary for the working of panopticism? Such tales of popular struggle clearly articulated a vision of populism resonant with the perceived potentiality of CB as a force to thwart state surveillance and commercial control of the media.

In terms of CB's "conditions of instrumentality," we would need to examine the historical potentialities at work that cohered to normalize or instrumentalize CB use; to make certain forms of conduct standard. What technological, economic, and social potentials united to create a new media instrument? More specifically, what role was played by changes in electronics manufacturing and design as transistors replaced tubes? What new social capacities emerged as prices for electronics were driven down by economies of scale and the exploitation of postwar Japanese labor? How did the co-constitutive infrastructures of highways and gasoline distribution get reoriented through the OPEC-induced oil-crisis? How did the range

of CB transmissions make possible or hinder community building, cultural interaction, and networked knowledge production? Such material conditions, constraints, and consistencies are the backbone of the apparatus. This is not a technological determinism, but rather an understanding of the apparatus as the outcome of intentionally focused actors wrestling with material, economic, and epistemological constraints.

There was clearly also the creation of a specific form of CB subjectivity. As a technology of the self, CB promoted a self-broadcast, recoded, renamed, and multi-channelled (literally) communicative subject that was open to constant interruption, noise, and squelch. As a population, the CB citizenry were pulled by the forces of state surveillance, a populist counter-surveillance mechanism, and a form of media collectivity that created its own programming and was free from the political-economic machinery that organized other widely used media. CB subjects and populations were mobile in spatial and linguistic terms, yet situated in a struggle over the proper use of a media technology, by those competing institutions that wanted to capture the potential of CB and its users. These modes of subjectivity were widely discussed and represented in film as well as in CB user guides and manuals, of which millions were sold. Such manuals existed in part because the FCC mandated that a copy of its rules must be present with all CB transmitters and receivers. As such, each CB guide included the rules, thus making them a complementary element in the legal ownership and use of CB. Beyond the presence of the official discourse, these guides most often opened with a variation on the general CB manifesto that outlined the democratic potentiality of CB to replace mass media and bring the power of communications to the masses. The guides also provided updated glossaries of the ever-changing lingo necessary for successful CB communication. Most generally, these guides provided the tools and ethos, both official and resistant, for becoming a member of what was being called the “CB Citizenry.” It provided the rules and modes of conduct appropriate to “proper” CB use. For instance, while the inclusion of the FCC rules was a necessary element, for the most part the manifestos and glossaries provided resistant vocabularies in which the FCC and the police were recognized as “the enemy.” Yet, “proper” use was still understood to be that of conversation and not singing for others’ entertainment. Discussions were imagined to be about the location of police, not recitations on poetics.

Questions for the Apparatus

In an earlier essay (Packer, 2010a) that attempted to answer the question “What is an archive?” from a Foucauldian perspective, I proposed five sets of questions or realms of enquiry from which one might begin the process of doing a Foucauldian media history. Borrowing from the four arenas considered above, I now propose to expand my set to eight.

(1) *Look to organizations, institutions, or credentialized experts whom we might call the determinators.* These are groups or individuals (not at all mutually exclusive) who have been given, granted, or taken the authority to make truth claims regarding specific phenomena. (Though often these realms can bleed over into seemingly unrelated areas.) They articulate desires and plans to alter institutions and individuals. A first question to ask is who has jurisdiction to make truth claims. The process that determines who is “in the true” and who can be an adversary in the games of truth is of particular interest. A further consideration is how particular venues of deliberation and institutions – media and otherwise – grant such authority. These often have substantial documents and holdings for investigations into their workings and to determine the mechanisms they use to create truths that can be “legitimately” acted upon to reform and alter behavior. So to begin to understand how an apparatus works would necessitate examining the discourse of those with plans to alter others’ behavior – as with, say, Jeremy Bentham in the case of Foucault’s scholarship in *Discipline and Punish*, the FCC in the case of CB, or at the YMCA in Ronald Greene’s scholarship on film.

(2) *Look to the statements that come to be “free-floating legitimators.”*¹² These are the statements that are used across numerous discursive sites of contestation to reanimate and legitimate claims and assumptions that organize numerous apparatuses. For instance, the terms “safety” and “freedom” worked to accommodate a wide range of goals, alterations, and reorganizations of institutions and people as they relate to the automobility system. We could ask what are the free-floating legitimators for an apparatus of disciplined mobility or mobile privatization? What are the overarching claims and goals that legitimate the movement to the suburbs or the organization of television as a one-to-many form of broadcasting? How has a term like “safety” been used to justify a whole host of military, governmental, commercial, and even familial initiatives? How have claims of “objectivity” been invoked not only by journalists, but in regard to scientific instruments?

(3) *Locate the competing and sometimes resistant forces and knowledge claims.* Although the “search for resistance” has at times led scholarship down the slippery slope of inconsequence, it is nonetheless the case that force acts on force. Which is to say that the creation of knowledge is always an act of violence against competing knowledge claims and those institutions, disciplines, and individuals who are their promoters. It must also be said that the victors in such struggles are not to be universally despised, nor are the proponents of subjugated forms of knowledge – who may have passed into obscurity – to be lauded for merely having struggled. With such caveats in place, it is essential that media history be composed not merely of the statements of victors or victims, but the full complement of competing discourses in their combative play of force. It is precisely through an understanding of how such force was exerted, thwarted, and redirected that a finer, more nuanced view of power/knowledge comes into focus. It may be just as likely that such analysis leads to a realistic understanding of the solidity of a particular power relation as it is to discover a latent resistance. In either case, if we acknowledge that the apparatus is the result of

strategies for the alteration of behaviors, we must then proceed by first understanding how such strategies won out. Yet, strategies are enacted against an adversary. Understand one's adversary.

(4) *Look to how media technologies work in terms of the material functioning of the apparatus.* They are the articulators of apparatuses. They work to bind things together. They are connectors – as in infrastructure. That is, they provide the mechanisms and processes that maintain the necessary movement and flows to keep an apparatus working smoothly. In this sense CB is a fairly obvious example. It allowed for the organization of fleet mobility, while also creating a mechanism by which important travel information could be shared amongst those using the road, most notably truckers and the police. We could say that one role of cellular telephones is to do precisely the same thing. It allows for the exchange of information necessary for orchestrating the movements of bodies and things in a highly mobile and fluid social environment. It links people into networks and provides a real-time response mechanism to adapt and alter trajectories in coordination with others. Because of the complex of forces exerted via the cellular phone, it is too simple to call the cellular telephone itself an apparatus in the way Agamben suggests.

(5) *Look for the processes of subjectification that are co-constitutive of the apparatus.* As Agamben suggests, this is the elementary process in the establishment of an apparatus. Subjectification works upon life itself, what it means, how it should be lived, and who can manage it (biopower). Beyond the obvious institutional realms of public health, medicine, and psychiatry, numerous guides for living articulate a vision of the good life or more specifically, how to organize the self and others via media. Lynn Spigel's *Make Room for TV* (1992) is an exemplary account of how television was imagined as a new means for remaking women's selves. As Spigel explained, there are often narratives, fictional and otherwise, which provide templates for imagining such new forms of subjectification. In relation to disciplined mobility, drivers' education manuals, guides for successful hitchhiking, and CB users' manuals provide practical advice *and* articulate a vision of a changed subject and an ethos said to be fused with such practices. Becoming a hitchhiker according to such guides is to reorient oneself to all sorts of spiritual and experiential dimensions (knowledge) unknown to the non-hitchhiker. It is also to place oneself into new economies of exchange (sharing of automobile resources) and new obligations to fellow hitchhikers (power). One obvious place to begin such investigation is to look for cases in which a subject is turned into an object. By what process and according to whom does a person become a patient, a child become a delinquent, a woman become a hysteric, a driver become a road-rager, a viewer become a couch-potato, or Facebook user become a friend?

(6) *What are the conditions of instrumentality and attendant epistemological stakes?* This is not so much a question of how struggles over meaning and truth take place. Rather, such a historical approach would look to the realms of phenomena that became differently experienceable, presentable, or knowable due to the emergence of a particular media apparatus. Underwriting such a process will be a particular "will to knowledge."¹³ Through what keyholes and into what new realms do

media instruments peer? How do cosmic and microscopic become spectralized? Which murmurs are made audible and what cacophonous squelching is modulated into perceptibility? Through what sinister synesthesia are smells visualized, tastes given voice, and light weaponized? The simple is made complex, the complex simple, but most importantly all is translated into processable data. This is one miracle of our media instruments.

(7) *What is the brute facticity of a media discourse network?* Following from Kittler, any Foucauldian media history would need to investigate how discursive networks are newly arranged by the introduction of new technologies by specific institutions. New kinds of markings, statements, utterances, sounds, and visions become possible, leave their traces, extend the life and reach of transmission, are differently processable, and distinctively networked and translated. Yet, the world is not merely made knowable, but actionable. Networks arise through the binding demands of data transfer. The bundling of instruments, people, and institutions results from the need to move people, data, and product from place to place in order to actuate effects. The content of CB speech is of much less significance than the potentiality to alter the trajectories and speeds of bodies and vehicles. But CB's fleeting data trail is also useful for our thinking. The impermanence of each CB transmission and the limited reach of its broadcast organize the extension of the network, the fidelity of messages (both in terms of "squelch" or noise and in terms of it only existing "in memory" to be passed along after translation by another CB citizen), and its limited capability to "impart culture" as opposed to its ability to "make culture" through conversation and dialogue.

(8) *How is the apparatus organized as a technology of governance?* Wrapping back to Foucault's explanation of *tekhne* demands that we think of media apparatuses as institutionally situated technologies used within specific governmental rationalities. These may be technologies that have worked to govern the self, captured the latent creative force of an audience, or created a public through problematizations. A historical investigation of a media apparatus draws attention to how it co-emerges with governmental formulations and modes of subjectification. New technological arrangements and scientific applications constitute power/knowledge relationships that are worked out in a context of epistemological, economic, political, and societal problems. The Japanese electronics industry, truckers, state troopers, rationed fuel, radar guns, automotive speed limits, C. W. McCall, and rapidly mutating linguistic codes emerge as part of the CB apparatus. CB does not bring them into being. CB is, however, thrown into the noisy fray and emerges as a conductor of disparate instruments, forming a new marching alignment. Media apparatuses hold together governmental formations, just as they are held together by multiple invested parties and institutions.

Conclusion

Foucault suggested he did not write histories of the past, nor was he interested in being a historian of philosophy. Rather he alternatively claimed to write fictions,

experiments with the real, and histories of the present. When it was suggested that “You know very well that what you say is really just fiction,” Foucault would always reply, “Of course there’s no question of it being anything else but fiction [. . . M]y problem is not to satisfy professional historians; [I] invite others to share an experience of what we are, not only our past but also our present, an experience of our modernity in such a way that we might come out of it transformed” (Foucault, 2000, p. 242).

In terms of transforming our present, I have suggested four arenas of scholarship that provide compelling examples of a Foucauldian-inspired media history. The work of Friedrich Kittler demands that we take into account how media alter the brute facticity of what is said, what is stored, and what is processed. He builds on Foucault’s archaeological approach by adding media to the mix. The Stanford School of the philosophy of science has been investigating the interrelationships of scientific instruments, epistemology, and the formation of scientific subjectivity for the past two decades. By opening up what counts as media to nominally include, if not centralize, such instruments, media historians can more thoroughly situate media as the centerpiece in how we come to know the world; how media are central to the production of knowledge. This means more than seeing media as purveyors of ideology or agenda setting, but rather as bearers of epistemological potentiality to the point of establishing the beginning of perception itself. This is what Deleuze, following on from Foucault, calls perspicuity. This quality of being perspicuous or noticeable is one of the oft-overlooked elements of Foucault’s description of panopticism. Third, historical and theoretical work in cultural studies, oriented by Foucault’s understanding of governmentality, can be built upon. Just as this work approaches culture as a realm for the shaping of conduct, media need to be situated in the broad array of technologies of governance. This centralizes power as a realm of relationships in which media are imagined, implemented, and used as solutions for the shaping of conduct. Media are mechanisms by which governance takes place. Lastly, Giorgio Agamben has championed the notion of apparatus as a means for examining a wide range of activities and technologies, including media. By treating the notion of the apparatus with greater precision and historical specificity, the history of media becomes a history of interconnections (of power, of knowledge, of subjectifications). Media apparatuses do not simply connect ethereally. Rather they are more akin to gravity; a force that holds things in place, sets the rules for space and time, and conditions material and technological possibility.

NOTES

- 1 The closest Foucault comes to treating the book as a media technology is in “What is an Author” wherein he addresses how the material form of books and other written media have differing effects on how the notion of an author functions.
- 2 Foucault first proposed such a schema in his introduction to *The Use of Pleasure* (1990).

- 3 Though it had earlier appeared in 1982 in *Skyline* and again in the *Foucault Reader* in 1984 as "Space, Knowledge, and Power," it also was mistakenly attributed to Stephen Riggins and misnamed "An Ethics of Pleasure" in the 1989 collection *Foucault Live*. More importantly, the interview follows up on themes that Foucault had not formally written about, but had most fully developed in his 1978–1979 lecture series *Security, Territory, Population* (2004).
- 4 As Clare O'Farrell (2005) is quick to point out, "studies of media" are one of the areas which Foucault "scarcely alluded to" but their practitioners have still "borrowed his ideas."
- 5 Though to be fair, one of his more powerful and recently published lecture series, *The Birth of Biopolitics* (2008), dwells upon the development of neoliberal economic models for governance in post-World War II Germany and the United States.
- 6 Shortly before his death in 1984 Foucault addressed the bewildering variety of characterizations used to describe him:

It's true that I prefer not to identify myself, and I'm amused by the diversity of the ways I've been judged and classified. Something tells me that by now a more or less approximate place should have been found for me, after so many efforts in such various directions; and since I obviously can't suspect the competence of the people who are getting muddled up in their divergent judgments, since it isn't possible to challenge their inattention or their prejudices, I have to be convinced that their inability to situate me has something to do with me. (Foucault 1997)

- 7 Peters (2010, p. 6) points out this tired joke, which is not only telling of Kittler's sense of humor, but more prominently his elitist political convictions.
- 8 *The Foucault Effect: Studies in Governmentality* (Burchell, Gordon, & Miller, 1991) is clearly the book that first generated wide-scale interest in this period of Foucault's work, in part as it was the first place the 1978 lecture "Governmentality" was published in English.
- 9 Some portions of the following section appear in Packer (2010a, 2010b).
- 10 This notion can be summed up by the Foucauldian use of the term "problematization." Such an approach in communications history and *scholarship* has to some degree been advanced in such articles as Russill (2008b), Bratich (2005), and Packer (2006).
- 11 This is a term I have used (Packer, 2003) to make sense of how the vastly increased freedom of movement enabled by automobility throughout the twentieth century came to be organized and implemented.
- 12 While obviously borrowing from Derrida here, there is a clear difference between what I'm implying by the use of this term. Derrida (1976) claims that all signifiers can be freely associated with different signifieds. Or more precisely that the play of signifiers, only ever referring to the general grammar of a given language, has no necessary correspondence to its referents. What I'm suggesting is that particular terms come to take on such significance that they can be used to justify nearly any truth claim across numerous discourses in order to justify a vast array of initiatives, plans, responses, and resistances.
- 13 Foucault describes the different forms of a "will to knowledge" that for each of which is "sketched out a schema of possible, observable, measurable and classifiable objects; a will to knowledge which imposed upon the knowing subject – in some ways taking precedence over all experience – a certain position, a certain viewpoint, and a certain function" (Foucault, 1982b, p. 218).

Race/Ethnicity in Media History

Catherine Squires

ABSTRACT

Media historians and scholars who utilize historical comparison in their work have drawn upon critical race theory to guide their interrogations of the past, and have structured important, complex renderings of media histories that debunk simple timeline and “great individual” approaches to historical inquiry. Attending to race/ethnicity in historical inquiry enriches scholarship, regardless of whether the subject is explicitly recognized as part of a marginalized racial/ethnic group or its cultural expressions. Unpacking the large and subtle ways race/ethnicity have shaped our media systems, production, and reception serves to both complicate and complete our view of the past.

This chapter maps studies of race/ethnicity and media history in four sections: (1) “Rediscovering Roots” illustrates how scholars have unearthed and preserved contributions of people of color overlooked by prior historians; (2) “Documenting Discrimination” reviews work that excavates histories of structural barriers, stereotype production, and other institutional exclusions in media history; (3) “Multiculturalisms and National Identit(ies)” explores scholarship that has acknowledged that our current era is not the first “multicultural” one to emerge; (4) “Public Memory, Race and Media” looks at the ways in which media scholars have turned to the role of media’s influence in public commemoration of historical events and figures, and how media figure into the representation of what our history and national identity mean in the face of different interpretations of and additions to dominant historical events.

Race/ethnicity, like gender/sexuality, provides scholars with lenses through which to understand histories of media industries, media representations, and media technologies. Taking race/ethnicity into account compels us to broaden the topics and approaches used in media history. Relatedly, attention to the ways in which race/ethnicity have shaped not only media systems, but also scholarly institutions, makes reconstructing histories of early media an urgent and often frustrating endeavor, as the works and contributions of people of color are not always as well preserved or maintained as those created by Whites. This essay provides an overview of some key works that address these issues. I draw from scholarship produced in fields such as communication studies, American studies, and history, and incorporate contributions by documentary filmmakers and archivists. These interdisciplinary endeavors have enriched historical explorations of race/ethnicity in media and model how we might apply what Houston Baker Jr. (1994) calls “critical memory” to the practice of preserving and telling stories not only of people of color who have been excluded from prior scholarship, but also to reconsider how we pursue any subject within the field of media history.

Why “Race/Ethnicity”?

Like most scholars, I consider race and ethnicity to be social constructions, not biological or otherwise essential characteristics of individuals or groups. I recognize the work of geneticists and anthropologists who conclude that “race” is not a “real” category of human differentiation. However, race/ethnicity does continue to “matter,” and its everyday use and impact really has nothing to do with scientific data or theory. Race is a powerful social construction, and however changeable or based in falsehoods, has impact on how we view the world and categorize its peoples. As Omi and Winant (1994) helpfully explain, race is a “dimension of human representation.” Omi and Winant describe “racial formation” as the sociohistorical process by which racial identities are constructed, reformed, and destroyed as groups contest the meaning of race and concomitant stratification. Media have historically played a huge role in racial formation, structuring and normalizing dominant understandings of our society’s racial/ethnic dimensions. Critical cultural scholars view media as institutions of ideological production, wherein racial projects – “interpretation[s], representation[s], or explanation[s] of racial dynamics” – are formed, challenged, and/or reinforced.

I choose to utilize “race/ethnicity” throughout this chapter to reflect the shifting, unstable definitions of these terms. Critical race theorists and historians have demonstrated how groups we now see as “ethnic” were referred to in racial terms in the not-so-distant past. Exemplary in this body of work are historical analyses by Roediger (1999), Ignatiev (1996), and Sacks (1994), who examined how Eastern European, Irish, and Jewish Americans were considered members of lesser races in the nineteenth

and early twentieth centuries. Likewise, scholars have deconstructed the ways in which “Asian American” and “Hispanic” are used to racially distinguish people even though the terms refer to region/geography rather than phenotype/biology (e.g., Chavez, 2001; Palumbo-Liu, 1999; Park, 2004; Perez-Torres, 2006). This is evident in how the US government, through its census categories and other official record keeping, continues to arrange groups by race and ethnicity in peculiar ways. “Hispanic” is considered an “ethnicity” while “Asian” and “Alaska Native” are considered racial categories. Moreover, the terms “race” and “ethnicity” are joined by the fact that everyone is assumed to have both: White Americans have ties to European ethnic groups; Asian Americans have roots in the ethnic and linguistic groups of the vast Asian continent; Latina/os Americans have ties to a variety of (Black) African, (White) European, and (brown) Native American populations; and so on. Given the ways in which race/ethnicity have been applied to groups over the last two centuries, media historians who investigate these social constructions must take care to understand how and why groups we think of today as “ethnic” may have been considered a “race” in past media representations.

Theoretical Inspirations for Histories of Media and Race/Ethnicity

The study of the role of social identities and social stratification provides the inspiration for including race/ethnicity in studies of media history. Racial/ethnic groups that have been marginalized have long been invested in reforming dominant media representations as part of liberation movements and tactics. Early attempts to combat stereotypes are seen in the eighteenth-century Black press, the NAACP’s protests against *Birth of A Nation*, and Jewish protests against “Shylock” plays and anti-Semitic characters in early Hollywood films. However, mainstream scholarship has not consistently tracked or addressed these issues. Indeed, not until after the breakthroughs of mid-twentieth-century social justice campaigns did the establishment of ethnic studies departments provide stable spaces for researchers to examine the role of race/ethnicity in media, both in terms of representations and in how racial and ethnic stratification have influenced the structure and workings of mass media industries.

Sociologists as far back as W. E. B. Du Bois have looked at media both as an area of inquiry into the production and role of stereotypes and as a tool to combat racial/ethnic discrimination. As more universities began to recognize the need for creating ethnic studies departments, more work on media emerged. Scholars of the 1970s and 1980s looked to cinema to examine how racial representations established central stereotypes and, in so doing, justified and reinforced regimes of White supremacy. Books such as Donald Bogle’s *Toms, Coons, Mulattoes, Mammies & Bucks: An Interpretive History of Blacks in American Films* (2001) and Jack Shaheen’s *The TV Arab* (1984) unearthed the ways in which Hollywood film and mainstream television codified

racial/ethnic stereotypes, and inspired new generations of scholars to look at US media through a critical historical lens.

Importantly, forays into explorations of race/ethnicity in media coincided with scholars' return to Marxist and Frankfurt School interests in ideology and hegemony. In the 1970s and 1980s the work of Stuart Hall and the Birmingham School revitalized interest in political economies of media, and social constructions of national identity and belonging that take place, in part, through media representations. Stuart Hall's (1996, 1997) work, as well as that of Edward Said's *Orientalism* (1979) and other volumes influenced scholars to deepen their look at media's role in forming national and racial identities. Hall's "encoding/decoding" model, along with rejuvenated interest in ethnographic methods, inspired a flurry of audience studies that attended to the role of race/ethnicity, class, and gender in audience responses to media texts. Key works include David Morley's *Nationwide* (1980), Henry Jenkins's *Textual Poachers* (1992), Janice Radaway's *Reading the Romance* (1984), Jacqueline Bobo's *Black Women as Cultural Readers* (1995), and Jhally and Lewis's *Enlightened Racism* (1992).

Michael Omi and Howard Winant's *Racial Formation in the United States* (1994) has provided crucial frameworks for understanding how media representations are part and parcel of social stratification systems, and how these representations may change in response to – or as part of – racial projects of the state, social movements, or other entities. Thus, media historians and scholars who utilize historical comparison in their work have drawn upon the aforementioned bodies of work to guide their interrogations of the past, and have structured important, complex renderings of media histories that debunk simple timeline and "great individual" approaches to historical inquiry. Moreover, their work often complicates earlier histories, and confronts issues that remain controversial as we continue to wrestle with the consequences of legal regimes of racial/ethnic stratification.

Postcolonial critiques, intersectional feminist theory, and deconstructionist approaches to race/ethnicity were instrumental in bringing concerns about racial and ethnic identity into the work of media scholars. Patricia Hill Collins's landmark work *Black Feminist Thought* (1992) included analysis of popular representations of Black womanhood, underscoring the necessity of combining race, gender, and class in media research. Shohat and Stam's *Unthinking Eurocentrism* (1994) similarly took on the ways Western assumptions and frames depict people of color worldwide, engendering a need to deconstruct the hegemonic modes of representation that dominate global corporate media. Their analysis underscores how our ways of looking are shaped by the sociopolitical environments structured by colonialism and apartheid-like systems.

The growing influence of cultural studies, critical race theory, and feminism alongside the emergence of "middle range" theories of media influence – such as agenda setting, framing, and cultivation theory – in the United States provided social scientists with language and tools to examine the continuing impact of racial formations on media output and public opinion. Robert Entman's work was on news frames and "modern racism" (1990) and Gamson and Modigliani (1987) delineated how

frames for affirmative action shifted over a decade of discursive and legal battles in the public sphere.

Attending to race/ethnicity in historical inquiry enriches scholarship, regardless of whether the subject is explicitly recognized as part of a marginalized racial/ethnic group or its cultural expressions. Unpacking the large and subtle ways race/ethnicity have shaped our media systems, production, and reception serves to both complicate and complete our view of the past and its relationship to present-day media and imaginations of the future. Approaching media history from the standpoint that race/ethnicity always matter, in some way, to the development of communication around the globe also opens up vistas to the ways in which our media have long been global and involved with projects of identity and identification, even though these terms have become more prevalent in media scholarship since the 1980s.

In the sections that follow, I map studies of race/ethnicity and media history into four areas:

- 1 *Rediscovering Roots*: This section explores how scholars have unearthed and preserved contributions of people of color overlooked by prior historians.
- 2 *Documenting Discrimination*: This section reviews work that excavates histories of structural barriers, stereotype production, and other institutional exclusions in media history.
- 3 *Multiculturalisms and National Identit(ies)*: This section explores scholarship that has acknowledged that our current era is not the first “multicultural” one to emerge. These works mine media history to reveal the complex interactions and power dynamics between racial/ethnic groups facilitated by media over the past two centuries.
- 4 *Public Memory, Race and Media*: This section looks at the ways in which media scholars have turned to the role of media’s influence in public commemoration of historical events and figures, and how media figure into the representation of what our history and national identity mean in the face of different interpretations of and additions to dominant historical events.

Readers will note that many of the examples used to illustrate these themes in media history come from scholarship on African Americans. This is due to three factors. First, my own research and writings have been largely focused on Black Americans, thus I am more familiar with the literature concerning Blacks and media. Second, because of the dominance of the Black–White divide in discussions and investigations of race relations, and the specific, peculiar role of slavery and colonialism in structuring the transatlantic racial hierarchy, more scholars have addressed Black experiences with media in their studies than other groups. Paul Gilroy’s generative text *The Black Atlantic* (1993) has been instrumental in fostering African diasporic studies in communication and other fields.

Third, in addition to the unique (albeit necessitated by Jim Crow) system of Black colleges (HBCUs), many Black/Africana studies departments were established at historically White colleges and universities (HWCUs) before the establishment of Latina/o and Asian American and Native American studies (Colon, 2003; La Bell &

Ward, 1996; Sumida, 1998), so there is a greater store of work on African Americans in the United States than other racialized groups. This imbalance in scholarship, however, is quickly changing, as new generations of scholars in American studies, ethnic studies, postcolonial studies, and other disciplines delve into the histories of groups once obscured by attention to the Black–White dichotomy, and as critical race scholars provide more sophisticated theoretical apparatuses that reveal how this dichotomy contributes to the structure of other racialized identities in the United States and abroad. Concepts such as diaspora, hybridity, global flows, and mediascapes, showcased in the influential work of Arjun Appadurai, will continue to impact the field as scholars revisit past media formations and campaigns.

Rediscovering Roots

One major task for media historians of race/ethnicity is excavating the work and struggles of people of color who engaged in media production and protest. The race/ethnicity power dynamics of past centuries, however, make this task difficult, since people of color had access to fewer archival and economic resources to preserve their media heritage, and because White-dominated organizations set up to preserve and celebrate media contributions did not recognize the accomplishments of non-Whites. It is a cliché to say that the victors write history; the records and deeds of the oppressed often do not survive. Moreover, historians often consult the writings of journalists to understand the agendas and interests of the public and the powerful. Thus, the journalistic accounts created by and for people of color, whether of mundane events or social upheaval, help us understand and center the experiences of those excluded from the news of the day in so-called mainstream papers. In this section, I draw upon the extensive body of work on the African American press, which attests to the importance of discovering and preserving records of how people of color have created and deployed media. Study of these news pioneers and journalistic output also allows scholars to explore different ways of doing journalism, and complicates dominant narratives of journalism history that track a straight line from the eighteenth-century partisan press to twentieth-century newspaper barons who ushered in objectivity.

Press Pioneers

Historians Roland Wolseley (1990) and Armistead Pride and Clint Wilson III (1997) have provided broad accounts of the early pioneers of the Black press. These books give readers a sense of the long-running dual goals of Black newspapers to provide a public sphere for African Americans, and to create viable business models for publishing regular accounts of Black communities and political interests. Henry Suggs's (1996) collection of historical essays, *The Black Press in the Middle West, 1865–1985*, importantly demonstrates the geographic diversity of Black communities, undermining historical narratives that segment Black life into North vs. South. Likewise, the documentary film

The Black Press in America: Soldiers Without Swords (Nelson, 1998) is a lively account of the popularity of Black newspapers and the influence of Black editors and writers within and outside their communities. These works show us how important Black periodicals have been, from a very early time in the nation's history, and how they continued to support a wide range of Black interests over two centuries.

In addition to broad surveys of the Black press, scholars have provided in-depth cultural and political studies of crucial individuals and eras in the development of the Black press and its interactions with both White and Black publics (e.g., Vogel, 2001). Jane Rhodes's (1998) biography of Mary Ann Shadd Cary, for example, takes readers into the heart of the free Black populations of Canada and New England, chronicling the intensity of the abolitionist movement and stark realities of the fugitive slave laws through the lens of Shadd Cary's pioneering journalism. The book usefully demonstrates the intersections of race and gender, illustrated through Shadd Cary's travels and writings, as well as the discrimination she faced as a Black woman working in a male-dominated field and movement. Melba Boyd documented the life of Broadside Press founder and poet Dudley Randall, on film (1996) and in a book (2003). Her work provides a detailed portrait of Black Arts Movement activity in Michigan, and its links to labor activism. Importantly, it documents the importance of Broadside to Black poets who were able to publish there before African American writers were sufficiently in vogue to gain entrée to White publishing houses.

Other writers have taken in-depth looks at how the Black press fostered talent in photography (Stange, 2001) and film criticism (Everett, 1996), and covered the Negro leagues and other Black athletic achievements (Wiggins, 1997). These works provide us with a three-dimensional portrait of past Black communities, reminding us that the Black press, like any other, supported and reflected not only the political interests of its readers, but also their entertainment and leisure activities. Because legal segregation and not-so-benign neglect meant the events and interests of people of color were rarely (if ever) seen in dominant newspapers, these works give us a sense of the breadth of activities going on in Black communities, businesses, and political organizations. Indeed, records in the Black press have been invaluable to historians looking to document events that are not recorded in "papers of record" and live only in fading memories of the participants – and, if they are lucky, on yards of microfilm. Penny Von Eschen's *Race Against Empire* (1997), for example, is essential reading for anyone interested in exploring how writers and editors of the Black press interacted across the Atlantic, connecting readers and thinkers in the United States, the Caribbean, Africa, and Europe long before "diaspora" became a buzzword in academia.

Diversifying the Archives: Preserving and Maintaining Records for Historical Research

In addition to telling the stories of early pioneers, historians and archivists have set their shoulders to the task of making early Black newspapers accessible and

searchable to the public. These efforts have emerged in book form and, more recently, through digitization. Annotated bibliographies, such as Charlene B. Regester's multivolume *Black Entertainers in African American Newspaper Articles* (2002), allow curious readers to browse content to get a sense of the range of people and places covered by popular Black papers. Likewise, Donald Jacobs's *Antebellum Black Newspapers* (1976) indexed three early anti-slavery papers, including the first known Black-owned paper, *Freedom's Journal*. *Voices of a Black Nation*, Theodore Vincent's (1990) compilation of articles from various Black periodicals produced during the Harlem Renaissance, gives readers an immersion in the wide variety of political and cultural ideologies circulating in the Black public sphere. These books, available in research and some public libraries, are important starting points for researchers who need to familiarize themselves with the Black press, and laypersons who may stumble across references to Black newspapers or editors in other accounts of history.

Happily, digital archives of the early Black press have come online. It is imperative for the archives of periodicals created by and for people of color to keep pace with the digitization of better-known titles so that scholars are able to get equal access to multiple viewpoints on events in the past. Digitization also ensures that as technologies shift, periodicals made by people of color will not be lost or relegated to old technologies that may or may not be as easy to search or use as Internet-based archives. James Danky's *African American Newspapers, 1827–1998* project is available through Readex; the *International Index to Black Periodicals* covers a range of African diaspora newspapers and magazines that launched in the twentieth century. ProQuest Historical Newspapers' database has included African American papers such as the *Los Angeles Sentinel* alongside its mainstream counterpart *Los Angeles Times*, but does not yet have a full range of Black titles covered prior to 1910. The Ethnic Newswatch: Historical database, also available through ProQuest, archives abstracts and full text articles from African American, Hispanic, Asian American, and Native American newspapers, from 1959 to 1989. Importantly, the database includes Spanish-language titles as well as English-language periodicals. Its companion database, Ethnic Newswatch, archives articles from 1990 to the present. For research on the mid-to-late twentieth century, and for scholars doing comparative research on news coverage of important events and political issues of the twenty-first century, this growing database will be very useful.

Rediscovering Roots in Other Media: Examples from Electronic Media

Of course, journalism is not the only area in which historians have worked to rediscover and preserve accounts and accomplishments of people of color in media. Work on film pioneers such as Oscar Micheaux has been done in earnest; most of the film reels from his early twentieth-century career have been lost. Revising the history of

film to shift the focus from Hollywood to figures that have tried to work within or outside the dominant studio system has brought the accomplishments of Native American filmmakers into focus in books such as *Wiping the War Paint Off the Lens* (Singer, 2001) and Randolph Lewis's (2006) biography of director Alanis Obomsawin. Jeff Adachie's documentary *Slanted Screen* (2006) allows us to sample the artistry of actor Sessue Hayakawa, whose career is detailed in Daisuke Miyao's (2007) biography. This Japanese American was an acclaimed leading man in silent films before the infamous Production Code and anti-Asian sentiment closed off opportunities for other Asian actors to follow in his footsteps. Similarly, books on Latinos in Hollywood, such as Clara Rodriguez's *Heroes, Lovers, and Others* (2008) and Rubie and Reyes's *Hispanics in Hollywood: An Encyclopedia of Film and Television* (1994) lay out the stories of Latinos and Latinas who worked in film from the silent era to recent times. Such histories remind us that exclusion of people of color was never 100% complete, and that the color lines drawn by dominant media institutions were simultaneously permeable and dangerously rigid.

Historians of radio and recorded music have also recovered the contributions of early DJs and musicians whose stories were rarely told. William Barlow's *Voice Over* (1999) and Mark Newman's *Entrepreneurs of Profit and Pride* (1988) showcase the efforts of early African American radio hosts, such as Jack Cooper, and civil rights-era DJs like Martha Jean "The Queen" and Nat D. Williams who used their limited airwave access to communicate important events and counter-discourses to Black audiences. Maureen Mahon's *Right to Rock* (2004) and Rebee Garofalo's *Rockin' Out* (2008) recenter the experiences of Black musicians and producers, thereby demonstrating how conventions for classifying and marketing popular music genres and performers were profoundly shaped by racism within the industry and expectations of the audience's racial understandings. This body of work retells the story of blues and rock "n" roll, revealing how racism in the music industry obscured the contributions of African Americans and embedded the stereotype that Whites play rock "n" roll and Blacks play rhythm & blues. Revisiting the roots of media industries, cultural styles, and related practices has transformed traditional media histories from a mono-racial narrative to one that views media production as a multiracial, if often segregated, enterprise.

Although the Internet is still considered a new medium, scholars have already staked out territory to write its history in an inclusive fashion, and to use the relatively low-cost World Wide Web to preserve and maintain older media. Anna Everett (2002) acknowledges the severity of the digital divide, but cautions us to recognize Black and Hispanic "early adopters" who went online in the early 1990s. This kind of recognition makes it more likely that people of color will be remembered in the history of digital communications, and resists the stereotype that positions Blacks and Latinos (as well as women of all colors) as technologically inferior. In a parallel project of memorializing people of color online, amateur and professional archivists have leveraged the Internet's multimedia flexibility to create sites to house "lost" images and texts. The Black Media Archive (<http://thebma.blogspot.com/>) has assembled webpages, pod-

casting, and hyperlinks to capture newsreels, radio interviews, photographs, and television clips that many people may have thought lost. Likewise, Densho: The Japanese American Legacy Project website (www.densho.org) hosts a digital archive of over 8,000 recorded interviews and more than 10,000 documents, photos, and news reports about the World War II internment of Japanese Americans. Included in the collection are digitized copies of newspapers produced in the internment camps, a crucial resource for scholars and teachers who want to center the experiences of Japanese Americans during the war.

When writing the history of the Internet, historians will have to include both narratives of the digital divide – which replicates and extends prior inequalities in media production and access – and stories of people of color who leveraged computer-mediated communication at an early stage in the World Wide Web’s development. Balancing concerns about equality with the task of recognizing early accomplishments and innovation by people of color will prepare future historians of the Internet to avoid the problems of documentation and visibility that have hampered accounts of film, radio, and print media. And, utilizing new digital tools to facilitate preservation of documentary evidence of people of color in the media is quickly becoming an important part of media history endeavors that seek to make traditional media histories more inclusive and insightful.

Documenting Discrimination

Boxed Out: The Economics of Race/Ethnicity in Media Production

A large portion of the work in race/ethnicity in media documents the practices of legal and social discrimination, as well as violence, against people of color in the media industries. Histories of newspapers created by people of color remind us of how White control of the mainstream press meant aspiring journalists of color had little, if any, reason to believe their bylines would make it into the dominant papers. Relatedly, people of color could not trust mainstream news to give their communities regular or “fair and balanced” coverage. Parallel presses emerged in Latina/o, Asian, and Black American communities to tell the stories the White press refused to tell, or exaggerated into ugly stereotype. Patrick Washburn’s *A Question of Sedition: The Black Press During World War II* (1986) diligently documents the ways in which the Black press negotiated its way through World War II, a time when the government was all too willing to silence “seditious” publications. For some – including FBI head J. Edgar Hoover – any protests against racism in the armed forces or other Jim Crow policies were “sedition” and linked to communist insurgency. Washburn’s detailed illustration of government surveillance of and interference in the Black press during World War II is a sobering reminder of how assumptions about the First Amendment

and the “free press” overlook the ways in which racial and ethnic groups have had their speech rights truncated through harassment and legal action.

In the past 40 years, scholarship on news produced by and for people of color has provided ample and detailed evidence of the resistance racial/ethnic minorities faced as they tried to create alternative public discourses through the vehicle of the press. The long history of Latina/o bilingual, English, and Spanish-language periodicals reveals the international scope of barriers Hispanic editors and writers had to overcome to produce news and opinion in the United States. As borders and international power relationships shifted between the Spanish–American War and the Mexican–American War, Latina/os in the Americas found that their journalistic freedoms ebbed and flowed with the politics of the times (Kanellos, 2000). Similarly, accounts of early pioneers of the Black press note how dangerous their work could be; Black editors and White abolitionist editors were often targeted for violence by pro-slavery Whites (Hutton, 1993; Ripley, 1993). This violence continued and escalated during and after the Civil War.

While today journalists lament the public’s decreased trust in their profession, the lives of journalists of color illustrate greater dangers of being out of favor with the dominant public. Exemplifying the dangerous position of Black writers who dared speak out against lynching and other crimes against Blacks is the story of Ida B. Wells, whose paper, *Free Speech*, was destroyed at the hands of a White mob. She received many death threats throughout her life, and regularly carried a pistol (Duster, 1991; Wells & Duster, 1972). As Wells and her male colleagues, most famously Robert S. Abbott, editor of the *Chicago Defender*, urged Blacks to move North, Southern legislators sought to stem the tide of their cheap labor force by banning Black papers.

Beyond government interference and violence, subtler means of suppressing the voices of people of color continued after the civil rights movement spurred initiatives to integrate the media industries. Pamela Newkirk’s *Within the Veil* (2000) documents the travails of the first generation of Black journalists who joined the ranks of the mainstream press in the 1970s and 1980s. Her book, along with Clint Wilson III’s *Black Journalists in Paradox* (1991), provide us with a sobering history of the first attempts at integrating the White-dominated press, and the failures of policies that focused too much on numbers and not enough on transforming racist journalistic practices and assumptions.

The mix of legal and social barriers to people of color is also found in histories of other media industries. Myriad books have engaged these issues in the arena of film. Hollywood’s infamous Production Code banned positive representations of interracial relationships. Moreover, Jim Crow hiring practices restricted the roles and spaces for people of color to appear in films, let alone make their own. Books by Peter Feng (2002), Robert G. Lee (1999), and Ono and Pham (2009) illustrate how Hollywood directors regularly used “yellowface” makeup on White actors rather than hire Japanese- or Chinese American actors for lead roles. For those actors of color who were given screen time the road was never easy, even with steady work.

Biographies of Hattie McDaniel (Watts, 2007) and Dorothy Dandridge (Bogle, 1997), for example, provide ample anecdotes of how directors, producers, and casting agents pigeonholed even popular actors of color into servants and sirens, stereotypes reaffirming dominant racial ideologies. These and other actors made compromises as they negotiated Hollywood, and often faced harsh criticism from communities of color for their alleged participation in stereotype production.

Given the barriers to complex representations of racial/ethnic Others, many people of color tried to create alternative films, just as they had created their own periodicals. But film and television production opportunities were not a realistic option for people of color. The dominance of the Hollywood studios – all White owned – and the Jim Crow practices of craft unions that provided the labor for behind the scenes and on-camera jobs meant few places were available to people of color looking to make an impact. Thus, it was highly improbable for someone of color to rise through the ranks from within. Likewise, barriers to entrepreneurship kept people of color from establishing independent television stations or film studios. Scholars have documented how the FCC notoriously denied broadcasting licenses to African American and Jewish applicants until the courts forced their hand (Barlow, 1999; Honig, 2006; Savage, 1999). And, as Jesse Rhines summarizes in *Black Film/White Money* (1996), even when pioneering Black filmmakers such as the Noble brothers were able to raise money to make a film, getting distribution was quite another thing. Then and now, White domination of all aspects of the film industry made getting films into theaters nearly impossible for people of color. While Oscar Micheaux was able to become the one and only Black filmmaker of his time to regularly exhibit films in theaters – mainly in Black neighborhoods such as Harlem in New York, and Bronzeville in Chicago – the unrelenting financial pressures and lack of alternative distribution networks proved too much for even this maverick (McGilligan, 2008).

Stereotypes, Silence, and Sensationalism: Representational Trends in Mass Media

Institutional racism, unsurprisingly, was reinforced by racist representations in film. Jack Shaheen's *Reel Bad Arabs* (2001) presents a content analysis of 1,000 feature films, finding a mere 12 contained positive images of Arabs; over 900 presented caricatures of harems, sheiks, and crazy fundamentalists. Writers such as Robert Berkhofer (1979), Jacquelyn Kilpatrick (1999), and Beverly Singer (2001) demonstrate how cowboy films and other fantasies of the "Old West" cemented visions of "savages," "noble warriors," and "Indian princesses" populating the continent. As Kilpatrick (1999) explains, these images of Native Americans are built upon literature and lore produced during the European conquest of North America and the Caribbean, reminding us of the links between politics, ideology, and representational practices. Indeed, it is notable how Hollywood capitalized on the early literature of the frontier,

making films of James Fenimore Cooper's *The Last of the Mohicans* (1826) and other novels that crystallized the stereotypes of the noble and ignoble savage during US western expansion. These representations positioned Native Americans (noble or not) as anachronistic beings, doomed to die out and unable to adjust to the modern world brought into being by new technologies and Euro-American cultural practices. These narratives justified broken treaties and genocidal policies of forced removal. Remade later as films in the 1950s and 1960s, these tales reassured White audiences that Manifest Destiny was both right and inevitable.

Some of the most compelling work on discriminatory media practices is contained in documentary films. Marlon Riggs's *Ethnic Notions* (1987) provides viewers with a sobering account of the ways in which slavery and Jim Crow shaped the most popular images of African Americans, from illustrations in nineteenth-century newspapers to early twentieth-century film. The follow-up, *Color Adjustment* (1991), continues the story into television, tracking the inclusion of African Americans from *Beulah* to *The Cosby Show*. Similarly, Deborah Gee's *Slaying the Dragon* (1988) and Jeff Adichie's *The Slanted Screen* (2006) demonstrate how fears of an Asian "yellow peril" and other Orientalist approaches cast Asians and Asian Americans into a handful of stereotypical roles in Hollywood and on television. Likewise, Philip Rodriguez's documentary, *Brown is the New Green* (2007), intersperses discussions of mainstream media's recent "discovery" of the Latina/o market with recollections and samples of Hispanic stereotypes that dominated US media throughout the twentieth century.

All of these films contain interviews with actors, actresses, and directors of color who describe their experiences navigating a media industry dominated by Whites and the limited range of choices they negotiate to remain working in their fields. *Slaying the Dragon* contains many segments where Asian American actresses such as Nobu McCarthy recount their frustration with casting agents and directors who wanted to see "lotus blossoms" and "dragon ladies" populate their films and shows. These interviews are paralleled with commentary from young Asian American women, who relay experiences with Whites who expect them to exhibit the characteristics of Madame Butterfly or Suzie Wong, illustrating how one-dimensional media portraits have an effect on audiences' perceptions of women of Asian descent.

Not surprisingly, the aforementioned films are leavened by the appearance and comments of many media and cultural historians. In *Ethnic Notions*, for instance, viewers are introduced to Patricia Turner, whose groundbreaking book *Ceramic Uncles and Celluloid Mammies* (1994) chronicles how common and widespread were images of African Americans as pickaninnies, grinning Sambos, and helpful mammies well into the twentieth century. Likewise, *Slanted Screen* uses testimony from Dr. Darrell Hamamoto, author of *Monitored Peril: Asian Americans and the Politics of TV Representation* (1994), to provide historical and sociological context for the stream of images presented in the film. Jackie Salloum's Sundance Award-winning short film *Planet of the Arabs* (2003) was inspired by scholar Jack Shaheen's work on televised and film portrayals of Arabs. The film itself delivers rapid-fire clips from many of the movies and shows analyzed in Shaheen's books.

These films play multiple roles in advancing the cause of media histories of race/ethnicity. First, the documentaries themselves contain oral histories of people of color in the media industries via the interviews with actors, actresses, writers, and producers. Their voices may never have been collected by other documentarians of Hollywood or television, making the films valuable for future generations of researchers and laypersons who have interest in these topics. Second, the films introduce viewers to academic researchers whose work informs the film, potentially broadening the audience for in-depth work on the subject of race/ethnicity in media. Finally, the images of media representations that are arrayed in these films trace timelines of representational politics in the United States. While the aforementioned scholarly works similarly provide a clear accounting of how representations of racial/ethnic groups have changed over time, the films have the added benefit of allowing the audience to visually experience these changes and alterations.

Multiculturalisms and National Identit(ies)

Historical investigations of media and race/ethnicity remind us of how contemporary discourses of multiculturalism and “post-racial” national identities are not so new. Moreover, these works show us how long the state and media have been interconnected in projects to form and reform social identities for various nation-building projects, as well as in response to direct challenges to racial inequalities. Importantly, these histories reveal assimilation projects and balkanized visions of “separate but equal,” as well as more cosmopolitan formulations for including (or exhibiting) marginalized groups in media.

Reinforcing Identity Boundaries Through Historical Narratives of Assimilable and Unassimilable Others

Many scholars have quoted an early short film by Thomas Edison that depicted the various “races” of Europe (complete with costume and stereotypical behaviors) being forged into “Americans” through assimilation. The media’s role in assimilating racial/ethnic others – and demarcating those groups that should not be assimilated – has been an object of scholarly scrutiny at least since the publication of Robert Park’s *The Immigrant Press and Its Control* (1922). Park’s work explored whether the foreign-language presses would hinder or assist assimilation into American culture, and how those presses maintained and nourished ties with the home countries and customs. Since that time, other scholars have examined the issue from the vantage point of dominant media: how do mainstream media portray “typical” American culture, and how do their portrayals gauge possibilities for racial/ethnic Others to become American. Media have subtly and blatantly reinforced and amplified notions

of Otherness in conjunction with racial projects that impacted legal definitions of citizenship and social understandings of who belongs in the United States.

The history of Native American representations in popular culture strongly illustrates how media have been integral to projects of assimilability and national identity. Even as US Americans violently displaced Native American tribes and broke legal treaties, “playing Indian” remained a favorite pastime for “real Americans.” Philip J. Deloria’s *Playing Indian* (1999) explores long-standing practices of Whites appropriating Indianness as a symbol of American authenticity while simultaneously denying the rights of actual Native Americans. This inherent and violent contradiction set the stage for White-dominated media culture to use Native American/Indian identities to rewrite the trauma of colonial domination as kinder, gentler cultural interactions. In her deconstruction of pioneer films that feature romantic tensions between White men and Native American women, Joanna Hearne (2003) notes how the bodies of the women were sacrificed – literally and figuratively – to allow safe passage for White settlers who took ownership of the Great Plains. In movies such as *Maya*, *Just an Indian*, Hollywood filmmakers affirmed anti-miscegenation codes that doomed interracial relationships and used the drama of Native women’s “willing” sacrifice to justify White takeover of Native lands. Indeed, these films and scores of other Westerns regularly positioned Whites as rightful inheritors of the land, reinforcing the Manifest Destiny ideology that positioned Native Americans as aboriginal, but not worthy of full citizenship in their own land. Notably, these movies are set in the nineteenth century, reinforcing the notion that Indians are only a part of the past, not the present, United States (Singer, 2001, p. 10).

Cross-racial romance has functioned as a recurrent trope in American media culture, and has mostly been deployed to reinforce a sense of White innocence and justify White appropriation of cultural and economic resources. Ono and Buescher (2001) take these issues into account in their analysis of the Disney cartoon retelling of the Pocahontas–John Smith legend. The authors excavate how Disney’s ahistorical and mythological scripting of Pocahontas and her tribe creates a cipher into which American consumer culture can recycle the myth as a positive origin story, erase the devastation of the Powhatan tribe in the wake of English colonialism, and ignore its heroine’s true end: death in England, far from the verdant landscapes of Disney’s “virgin” America.

Although the “sacrifice” of the “tragic mulatto” or “half-breed” is often visible in media narratives of Black–White and Asian–White romance, it serves the same goals: reinforcing the color line and justifying White hegemony. Work by Cynthia Nakashima (2001) and Suzanne Bost (2002), and collections by Beltran and Fojas (2008), track how popular-culture images of mixed-race individuals and couples simultaneously broke and reinforced racial taboos. Likewise, Jacqueline Stewart’s (2005) study of early silent films demonstrates how filmmakers’ comedic shorts of race “mix-ups” – such as a White woman accidentally picking up a Black baby on a crowded, confusing city street – reflected anxieties about the Great Black Migration’s impact on urban life, and animated for audiences the presumed horrors that could be unleashed if Blacks and Whites lived in close proximity.

Other work in this area has focused on disjunctures between official discourses of national identity or unity and the realities of racial discrimination on the ground. Yeidi Rivero's *Tuning Out Blackness* (2005), for example, shows how Puerto Rico's formal acknowledgments of African roots rarely resulted in televisual embrace of Blackness in the 1970s. Eschen's *Satchmo Blows Up The World* (2006) explores how the US State Department's Cold War-era attempts to use jazz musicians as ambassadors of American freedom in the midst of struggles for civil rights at home unleashed tensions between the cultural exports and their government, sometimes resulting in unexpected leverage in race relations policies.

Testing the Waters: Media and Narratives of Racial/Ethnic Tolerance

Recent histories of World War II and postwar media highlight the ways in which the federal government as well as private media firms attempted to promote interracial/ethnic tolerance. Some of these projects were clearly strategic: Barbara Savage's *Broadcasting Freedom* (1999) brings to life the Office of War Information's investments in radio programming aimed at quelling racial and ethnic tensions. Fearful that Axis propaganda would turn African Americans against the war, and wary of labor organizers who advocated interracial solidarity in the name of socialist brotherhood, the government turned to radio to assure Blacks that they were valued members of the public. Programs like *Freedom's People* joined *Americans All* in articulating an ethnically pluralist America, joined by a dedication to the American Dream. While these efforts were chiefly created to alleviate dissent, Savage shows how well-placed individuals in the government and radio programming units used the popularity of these shows to bring more discussions of race/ethnicity to the airwaves after the war, and extend the discussions beyond the Horatio Alger-style narratives of hard work and tolerance that dominated the government programs.

In the midst of the Red Scare and in the wake of Hitler's genocide, some studio heads in Hollywood saw a need for socially conscious films to address race/ethnicity. Gayle Wald's *Crossing the Line* (2000) studies how "message" films, such as Elia Kazan's *Pinky* (1949), were framed as tools in the war against intolerance. Many of these films, like *Pinky*, featured "passing" characters and interracial tensions. While the films tried to articulate positive characterizations of their main characters, people of color who populated the fringes of the story remained one-dimensional stereotypes. Similarly, Ed Guerrero (1993) and others have commented on the emergence of Sidney Poitier as the leading Black actor in the 1950s. Poitier was positioned as an "exceptional Negro" in all of his early films, and was rarely on screen with other African Americans or involved in racial tensions. The films *In the Heat of the Night* (1967) and *Guess Who's Coming to Dinner* (1967) broke this unspoken rule of race avoidance. However, as analysts of these films note, Poitiers' characters remain beholden to White characters, who must provide him with either safe passage (*Heat of the Night*) or permission to

marry their daughter (*Guess Who's Coming to Dinner*). These observations do not take away from the achievements of Mr. Poitier; rather, scholars point out that Hollywood's conservatism in racial matters results in representations that lag well behind contemporary events and, sometimes, public opinion and behaviors.

Another body of work explores genuine (and disingenuous) attempts to cross racial/ethnic divides to "understand" the Other via media or performance. Lutz and Collins's *Reading National Geographic* (1993) takes readers through the history of the venerable magazine, and exposes how its roots in colonial and imperialist projects shaped its narratives of "civilized" and "natural" societies. The paternalistic and voyeuristic relationship with the developing world that emerged not only framed racial/ethnic others as "primitives" or "exotic," but also reinforced racial binaries that supported a vision of White, Western peoples as "sophisticated" and "civilized." The authors track how visual techniques codified in the magazine have influenced travel photography and tourism advertising as well, such that the presentation of "natural" and "exotic" racial/ethnic others sets the tone for airline and cruise travel to locations in the Pacific Islands and other spaces. Importantly, the research includes reader-response studies with contemporary subscribers as well as textual analysis of photos and historical analysis of *National Geographic's* origins. Through this multifaceted look at an influential mass-market magazine, Lutz and Collins show the great impact media can have in shaping reader sensibilities about racial/ethnic Others, and how narrative and visual conventions reinforce troubling assumptions about the place of people of color in modernity.

In the realm of popular culture studies, three authors have staked out the role and impact of blackface entertainment in American media and ethnic/race relations. Eric Lott's *Love and Theft* (1992), Lhamon's *Raising Cain* (2000), and Melvin Ely's *The Adventures of Amos "n" Andy* (1992) delve into the psychological and social intricacies that emerged from the practices of minstrelsy. These authors argue that blackface should be considered one of America's earliest forms of mass entertainment, and chronicle the longevity of the practice and its many controversial facets. These books demonstrate how powerful racial imagery and mimicry have been in American culture, and how hard it can be to untangle the racist elements from the sometimes innovative, liberating creative moments of blackface entertainment that Lhamon argues are deeply embedded in contemporary dance, music, and visual arts. Blackface was and continues to be terrain for experimentation with racial identity and expression, even as it troubles us with its racist origins and assumptions of embodied difference. These histories are crucial texts for us to revisit, especially as we continue to see eruptions of blackface/voice and yellowface/voice in mainstream media, as well as under the radar on the Internet. On-air gaffes by Rosie O'Donnell, who mimicked Chinese vocalizations, and Don Imus and Rush Limbaugh's sidekicks, who brought us blackvoice mimicry about the Rutgers University women's basketball team and "Barack the Magic Negro," reveal the continued use and abuse of minstrel and yellowface humor, a form that continues to titillate and shock audiences. Students and scholars can better appreciate these contemporary controversies with the complex historical visions offered by these texts.

Public Memory, Race and Media

Because of the racial/ethnic power dynamics of the United States, historians have long “been engaged in a struggle over what to say about America’s past and how to say it” (Fabre & O’Meally, 1994, p. 3). This struggle has influenced media scholars’ accounts of the origins and outputs of our media systems – specifically for media historians, the ways media contribute to public and personal memories – authorized and unauthorized narratives – of our nation’s identity, key events, and esteemed individuals. Struggles over how the story is told and who can do the telling are intimately linked to questions of racial stratification. As Barbie Zelizer demonstrated in her generative book *Covering the Body* (1992), journalists and other media practitioners not only lay claim to “writing the first draft of history” but also participate in choosing and framing which individuals and issues merit continued memorializing well past the initial events that made phenomena “newsworthy.”

Following Pierre Nora, media manufacture and provide *lieux de memoire*. Newsreels, television retrospectives, articles, interviews in the archives, and other fictional and documentary materials mark where and how “certain landmarks of the past” are selected and invested “with symbolic political significance” (Fabre & O’Meally, 1994, p. 7). Therefore media, as much as formal history texts and museums, provide the public with frameworks and touchstones for thinking about our racial past, setting the stage for contrast with the present and speculation about the road to the future. These dynamics are well illustrated in contests over media representations of slavery, the civil rights movement, and the ways Black music culture became interwoven with “American” culture in the twentieth century. As Susan Willis and others note, the late twentieth century witnessed an explosion of Black cultural presence in mainstream mass media (Willis, 1994, pp. 178–179). How the experiences, memories, and stories of a people forcibly segregated from media production and inhibited from telling their experiences in public are represented by the same media systems that participated in segregation, stereotyping, and silencing presents complex, troubling questions for media scholars.

Kelly Madison’s (1999) dissection of 1980s and 1990s Hollywood films about Black freedom movements is particularly instructive. She delineates how White characters were centered in films that were ostensibly about the struggles of African Americans to gain equal rights. However, in order to position Whites as heroes, Black leaders and laypersons were relegated to the sidelines. Madison suggests that the centering of White subjects at the expense of Black subjects reiterated the need to reclaim a sense of White racial innocence that was damaged by the challenges of the civil rights movement and shown to be a lie. Likewise, Ed Guerrero’s (1993) examination of 1930s and 1940s films finds a fascination and fetishization of the antebellum South, most notably in *Gone With the Wind* (1939). These films present a fantasy of a genteel South with a peculiar, but benevolent, institution of slavery, where devoted slaves were happy in servitude. Thus, Hollywood served up a myth of racial harmony under White supremacy at a time when race relations were strained between North

and South in the wake of the Great Black Migration, new immigration from Europe, and labor activism that alternately called for solidarity across racial lines or deployed racial animus to leverage economic and social gains. In both cases, Hollywood's depiction of the racial past served a need in the present and distorted the past.

Acts of Appropriation and Forgetting

Scholars who have incorporated Whiteness studies into their work on media history similarly find that representations of Asian cultures often center White experiences (Ono & Pham, 2009). From David Carradine's role in the 1970s TV show *Kung Fu* to Tom Cruise's star turn in *The Last Samurai* (2003), mainstream media reinforce the sense that Asians are "forever foreigners" and that Whites may be better able to inhabit and protect the most worthy Asian traditions. For example, Sean Tierney shows how, in *Last Samurai*, Cruise's character somehow is able to master the arts of samurai swordsmanship and honor codes in six short months; he kills Japanese men who have studied the forms their entire life, and becomes fluent in Japanese as well. He becomes the "true" inheritor of samurai tradition, displacing the other masters in the movie. This pattern of displacement occurs in many other films that feature White characters who learn martial arts in Asia or from Asians (Tierney, 2006). Like Leatherstocking in *Last of the Mohicans*, White men are portrayed as "supraethnic" as they absorb the "best" aspects of a "foreign" culture (Tierney, 2006, pp. 610–611). This exchange is one-sided: Whites absorb Others' traditions, and then the Other culture recedes – or is destroyed – as Western "civilization" advances.

These displacements replicate distorted and one-sided depictions of eras of inter-group contact and conflict. This is exemplified in Hollywood and pop fiction tales of the Whites and Native Americans interacting in the colonial era and during western expansion. Beginning with the multiple retellings of the Pocahontas–John Smith affair, to *Dances with Wolves* (1990), the 1992 remake of *The Last of the Mohicans*, and steamy romance novels, dominant media have invented fantasies of environmentally correct gentle natives, Manifest Destiny, an ever-receding frontier, and the inevitable extinction of Native American ways of life. As S. E. Bird (1999) puts it, even though the "noble" images have become more prevalent in contemporary film and television, the characters remain "either rooted in the past or in a conception of American Indians as traditional and primitive" (p. 78).

War and the Other: Revisiting and Rewriting Battles

Media accounts of past wars involve sensitive issues of national identity and purpose, and deserve special mention given the ways in which enemy construction is racialized (Merskin, 2006). Essays in *From Hanoi to Hollywood* (Dittmar & Michaud, 1990) evaluate the range of revisionist strategies for telling the story of the Vietnam War. From

Rambo's "win" over stereotypically evil Vietnamese villains to *Platoon's* (1986) troubling depiction of White officer – African American troop relationships, the essays in the collection speak to "the power to make images that may displace, distort, and destroy knowledge of the history in which [others] participated" (Dittmar & Michaud, 1990, p.1). Thus, even though many films about the Vietnam War are progressive in that they incorporate anti-war messages, they simultaneously recycle disturbing stereotypes. For instance, Asian women appear either as helpless victims or hyper-sexed party girls searching for White GIs. And, because these films frame the story from the vantage point of White male main characters (mostly US soldiers), the Vietnamese remain a mass, and the Vietnamese soldier a savage, faceless enemy.

How soldiers themselves are represented is also problematic, as films often look back and incorporate contemporary desires for multicultural inclusion. These desires, while well intentioned, distort the actual racial dynamics of the armed forces during and before Vietnam. Leo Cawley's essay on war films shows how Hollywood portrays the infantry platoon "as a basket of antagonistic ethnicities that is transformed and elevated by American democracy when it forgets its differences and dedicates itself to defending that democracy" (Cawley, in Dittmar & Michaud, 1990, p. 73). Unfortunately, the price of this American interracial cohesion is usually dehumanizing racial/ethnic Others on the enemy side of the line. The soldiers bond as they "kill the Jap/Gook/Hun (fill in the blank)." *The Dirty Dozen* (1967) is exemplary of this formula, where the motley crew of White ethnics and one Black soldier take down the Nazis. This multicultural vision of the infantry as a crucible of the melting pot also comes at a cost of forgetting the very real racism and ethnocentrism Black, Hispanic, Native American, and Asian American soldiers experienced and continue to experience in the armed forces. More recently, the reboot of Captain America engages in a post-racial reimagining of World War II, where the Army includes Black soldiers in the elite unit led by Captain America, whereas in reality, Black soldiers were segregated until President Truman signed Executive Order 9981 in 1948. The contemporary impulse to "integrate" the silver screen simultaneously undermines our understanding of history, whitewashing the ugliness that preceded the integration of the US Armed Forces, including the abuse and lynchings of multiple Black servicemen between and after the world wars.

Commemorating "Progress" and Forgetting Opposition: Martin Luther King, Jr., Obama, and Media

One can easily see the intertwining of media, public memory, and race/ethnicity in the explosion of "commemorative editions," coffee-table books, televised specials, and deluxe DVD sets generated in the wake of President Barack Obama's election in 2008. These trinkets blare a common theme: that with the election of a biracial Black man, the United States has proven that the racist past has truly passed. Multiple commentators in the press and members of the press have opined that we have,

indeed, entered a post-racial era (see critiques by McKissack, 2008; Peterson, 2008; Wade, 2008). At the same time that media represent the election of Obama as the culmination of Martin Luther King's "dream" of American racial equality, many scholars have applied critical memory both to the construction of King's dream, and to the media's self-serving myopia in racial matters.

As Houston Baker Jr. (1994) argues so eloquently, dominant narratives of King's life paint him as an always-already revered man of peace; as an advocate of "color-blindness." One needs only to look at the exhaustive analysis of news about King in Lentz's *Symbols, the News Magazines, and Martin Luther King* (1990) to see how far from true this picture of universal admiration is. Bostdorff and Goldzwig (2005) mapped out how President Ronald Reagan appropriated King's rhetoric, twisting the commitment to social justice into a belief in individual responsibility. Similarly, Ronald Turner (1996) charts the dangers of "distorting and deviating" from King's "color aware" approach to tackling racial injustice. He notes that conservative attempts to take on King's mantle deliberately leave out his commitment to anticolonial and antiwar movements, and his endorsement of affirmative actions to dismantle the apparatuses and effects of racial segregation. Other scholars have examined how neoconservative reappropriation of the "I Have A Dream" speech has followed Reagan's lead, actively rewriting King's legacy to advocate against the legislation and court decisions that dismantled Jim Crow (Brown et al., 2004; Hall, 2004).

Relatedly, in two special issues of the *Black Scholar* (2007, 2010), commentators and scholars have noted how Obama has been distanced from the more radical aspects of King's legacy, aspects that are already obscured in contemporary celebrations of King as a color-blind icon. Indeed, many comment on how much the campaign stayed away from issues of racial justice until forced to address race head-on in the wake of the Rev. Wright–YouTube scandal. Others have explored how memorials of King become terrain for Black and White political elites to contest the meaning of the civil rights movement (Polletta, 1998). Black political elites, as "insider/outside" in the federal government, have more at stake as they negotiate how to keep alive the more radical aspects of King's career and oppositional politics, while their White colleagues tend to emphasize King as a conciliatory figure who will help us "overcome" the racial past rather than insist upon confronting the meaning of institutional racism.

Harry Reed (1999) noted in the *Journal of Negro History* that public celebrations – including thousands of re-broadcast excerpts of the titular lines from the March on Washington speech – meditate on the "dream" more so than the critiques King launched against the US government, our class-segmented society, and the military-industrial complex. In his many, many other speeches, King spoke about *public policy* and justice, not *dreams*. Thus, concerns about media representations of the "dream" are simultaneously concerns about how we frame racial policy in the present and the future. That is, if dominant media discourse heralds Obama as the achievement of what conservatives see as King's dream of a "color-blind" nation, then counter-memories of King are necessary to mount opposition to not only the policy prescrip-

tions that extend from the color-blind representation of racial equality but also the distortion of our collective memory.

Remembering Race/Ethnicity

Our media system was built, in part, on practices of *forgetting* acts of violent oppression against people of color within and outside of the borders of the United States. Part of that forgetting has been amplified by structural racism that limited the opportunities for people of color to record and transmit their own stories through media. Thus, it will continue to be a challenge for historians to give voice to those silenced by those acts, and to chart the sometimes hard to trace legacies of people of color in media, whether in dominant venues or alternative ones. Media histories that attend to the complexities of race/ethnicity also urge us to guard against engaging in simplistic desires for a post-racial era in media, or to see the evidence of progress in representation as part of a simple upward trajectory toward a color-blind world. Rather, we must be diligent in our contemporary research to be inclusive of axes of difference so as not to replicate the mistakes and oversights of past media research.

The end of Jim Crow segregation law does not mean an end to the influence of race/ethnicity in media and historical accounts. Rather, as depictions of the events of 9/11, the wars in Iraq and Afghanistan, and 2011's shocking terrorist bombing and shooting rampage in Norway have illuminated, our racial/ethnic identities continue to matter in how the media mark historical events and map out their significance for our future. In *The Persistence of History: Cinema, Television, and the Modern Event*, Vivian Sobchak writes that today, "history seems to happen right now – is transmitted, reflected upon, shown play-by-play [. . . T]here seems to be a sense in which we believe we can go right out and "be" in history: hence the people who flocked to the sides of the freeway to watch – and be in – the "historic" parade led by O. J. [Simpson]" (Sobchak, 1996, p. 5). Media events (Dayan & Katz, 1992) make us feel as though we are "witnesses to history" and, at least, vicarious participants in history. But our "witness" is framed carefully and orchestrated by editorial choices, camera angles, and narrators who walk us through events and aftermaths. When one racial group continues to have disproportionate decision-making power in media, then the question must be raised about how their assumptions shape our sense of history in the making, and possibly exclude important views and experiences as they pick and choose which events and individuals to record for posterity.

To close, media historians must continue to examine the past and our present research projects to ask whether *de jure* or *de facto* racial/ethnic exclusion has shaped our data or approaches. The answer to this question may require us to work harder to access archival materials or other sources that can illuminate if and whether those exclusions will change the nature of the inquiry. On the institutional level, we need to monitor whether our libraries have databases and other resources to support

research on people of color in the media, and ask ourselves how to remedy imbalances. Likewise, as media scholars frame historical questions that involve race/ethnicity, we must guard against anachronistic uses of racial/ethnic terminology; that is, we must recognize that contemporary labels and approaches may not yield results when investigating the past, when nomenclature and attitudes allowed for a different range of discourse about race/ethnicity. Finally, as we continue to explore the past, we should endeavor to articulate what, if any, lessons our explorations hold for the present and future. Certainly today, as people experiment with the term “post-racial” to describe an immanent, better future, we should be bold in clarifying how race/ethnicity has shaped our media’s past and present, and offer cautions for the future.

Approaches to Gender and Sexuality in Media History

Gretchen Soderlund

ABSTRACT

This chapter surveys scholarship that lies at the intersection of media history, gender history, and the history of sexuality. Work that cuts across these three areas serves as a necessary corrective to the masculine bias found within conventional media histories. However, much of the scholarship surveyed focuses narrowly on “women” as a biological category, ignoring the critical role commercial and social-movement media have played in producing, reinforcing, and challenging historical understandings of gender and sexuality. Much work remains to be done in this important field. In particular, there is a paucity of works within media history that consider the cultural production of gender, race, and sexuality in relation to one another and within fields of power.

Like historical scholarship more broadly, the overwhelming majority of studies tracing the history of media are written with a decidedly male bias: the considerable involvement of women in all facets of media production is often downplayed, diminished, or outright ignored. Take, for instance, two lengthy histories of media since 1600, *The Press and America: An Interpretive History of the Mass Media* by Michael Emery, Edwin Emery, and Nancy Roberts (2000) and *The Creation of the Media:*

The International Encyclopedia of Media Studies, First Edition.

Political Origins of Modern Communication by Paul Starr (2004). Their very titles portend to offer a comprehensive history of the social actors and debates that made the mass media what they are today. Indeed, both works are richly detailed and offer informative accounts of major developments in news industries over several centuries. Starr's work, in particular, seeks to demonstrate how open debate about media-related policy helped to shape the development of the media from the eighteenth century onward. Yet these works, written from a grand history perspective, have little to say about women's role in the development of the print and telecommunications media (let alone the role media have historically played in producing, reinforcing, and challenging gender and sexual identities).

Indeed, over the last two decades the subfield of media history has arguably lagged behind the discipline of history in recognizing gender and sexuality as conceptually important, let alone analytically central, to its object of inquiry. Feminist media historians thus face what Maria DiCenzo (2004) calls the dual challenge of "filling the gaps of more conventional histories of the press, as well as situating women's social movements in larger social, political, and economic historical contexts" (p. 45). Despite the magnitude of the task at hand, each decade since the 1980s has seen an increase in the number of works chronicling the involvement of women in media or demonstrating the significance of media to the historical construction of gender/sex.

Drawing on material from journalism and communications, media studies, history, and English, this chapter provides an overview and analysis of studies that lie at the intersection of media history, women's and gender history, and the history of sexuality. Much of this work falls within four broad categories: (1) accounts of women in mainstream print or broadcast journalism and other media trades, including advertising, public relations, and entertainment industries; (2) examinations of women's and LGBTQ social activist media; (3) analyses of gender- and sexuality-related media content; and (4) research on gendered reading, listening, or viewing audiences and the rise of the woman consumer. We can draw further distinctions between studies that treat media as technological forms, those that understand media as political and social institutions or commercial industries, and those that conceive of media as instruments of publicity (i.e., work on the public sphere). The works considered in this overview serve as important correctives to the conventional media histories. Taken as a whole, however, they display their own biases and omissions. The existing English-language historical scholarship on media/gender/sex betrays a Western bias: the majority of studies center on Britain, the United States, and English-speaking Canada. These studies are also temporally limited in that they focus on the last two centuries of media use. Gender and sexuality in the media histories of non-Western societies and within longer histories of media use are fruitful and important sites for further investigation.

In this chapter I will focus on histories of print and telecommunications media. Since Laura Mulvey's groundbreaking 1975 article "Visual Pleasure and Narrative Cinema," feminist and queer film theory has produced a rich body of work theorizing

the relationships among film, gender, and sexuality. This work shares an affinity with feminist and queer literary theory and has emphasized psychoanalytic and poststructural/queer theories of gender identification and the construction of heteronormative desire. Studies of gender in other media, by contrast, have taken a more empirical, sociological, or populist/Marxist bent and have often paid more attention to the audience as a sociological entity than has film studies. With a few notable exceptions, studies of the history of gender/sex in journalism and telecommunications have neither lent themselves to densely theoretical analyses nor attempted to link various media platforms or media content to the production of sexual desire itself.

Gender, Sexuality, and Media

Like the term “media,” gender, sex, and sexuality are far from straightforward concepts. Within second-wave feminist theory, sex and gender were presented as a dyad with sex denoting raw biological markers of sexual difference and gender signifying the meanings, roles, and statuses that society attaches to differently “sexed” bodies. Thus what it means to be a “woman,” according to this logic, is culturally and socially constructed, and therefore changeable, even if being “female” is largely an immutable biological fact. This critical distinction between sex and gender led feminist anthropologist Gayle Rubin (1997) to suggest that every society has its own sex/gender system, which she defines as “the set of arrangements by which a society transforms biological sexuality into products of human activity, and in which these transformed needs are realized” (p. 28). Formulations like the sex/gender system were important for feminists because they demonstrated that what was represented as the most “natural” form of difference, that of sex, which served to justify women’s status as the “second, inferior sex,” was actually the product of a given social order (Beauvoir, 2010).

Some later feminist theorists charge that second-wave feminism endowed biological sex with a materiality that it did not deserve. Butler (1993), for instance, questions whether our scientific and popular understandings of biological sex can exist outside of cultural systems of signification. She argues that it is only through the repetition of cultural performances of gender that biological sex is given its status as immutable substance. Further, feminist biologist Anne Fausto-Sterling (2000) critiques the notion that biology itself gives us only two options, male and female. Using examples of “intersexed” people whose chromosomal traits and reproductive organs do not fit neatly into the dominant biological framework, she argues that the two-sexed model obscures at least three additional sex categories.

Some of the historical scholarship surveyed in this chapter recognizes the feminist distinction between gender and sex and is attentive to the significant role media have played in naturalizing gender difference. A large portion of it, however, tells a

straightforward “women’s history” that treats gender as a synonym for women and understands women as all people biologically female. One work within gender/sexuality/media history that productively engages the idea that gender *and* sex are actively constructed through media is Margaret Beetham’s *A Magazine of Her Own?* (1996). This study of such Victorian-era domestic magazines as *Woman at Home* and the *Englishwoman’s Domestic Magazine* shows how these texts “brought into being the woman it addressed as gendered, sexual and embodied.” Taking a performative perspective, it argues that the “naturalness” of the forms of femininity promoted in these magazines “had to be insisted upon again and again precisely because [they were] so slippery.” Beetham goes on to suggest that the “magazine which comes out regularly weekly or monthly over time is the ideal form” for the repetition of these complex identities (Beetham, 1996, p. 4). Indeed, through her close readings of articles on grooming and childrearing and of lavish instructions in the etiquette of how to behave like a proper middle-class Englishwoman (not to mention the advertisements for corsets and other products for physically transforming the body into a feminine form), Beetham demonstrates that there was nothing remotely natural about the Victorian female body.

Within the discipline of history, Joan W. Scott (1999) offers an expansive definition of gender that allows us to see the relevance of this concept to even seemingly ungendered domains. For Scott, “gender is a constitutive element of social relationships based on perceived differences between the sexes, and gender is a primary way of signifying relationships of power.” She goes on to suggest that “changes in the organization of social relationships always correspond to changes in representations of power, but the direction of change is not necessarily one way” (Scott, 1999, pp. 42–43). Scott identifies gender as a central organizing concept in history that should be present in even the most “analytically cast account of the workings or unfoldings of large-scale processes of social change” (p. 17). Thus historians of the press like Starr who make only passing mention of women because their focus is on the “masculine” political or military realm ignore the ways in which gender informs and even structures these arenas as well. The application of Scott’s understanding to media history would show that the media are always richly social and have historically included topics pertaining to gender and sexuality as well as heavily gendered viewpoints, ideologies, and analysis.

Indeed, in her study of radio in Weimar and Nazi Germany Kate Lacey (1997) concludes that “the history of radio cannot properly be understood if gender is absent as a category of analysis” (p. 221). Her analysis considers women as audiences for German radio programming but also the ways in which a subtly gendered language of media discourses framed policy discussions and determined the social and political functions of radio during this period. In general, histories of radio and television have been quicker to foreground gender than histories of the press, in part because the programming these media offered often centered around the domestic sphere where many middle-class women labored. Consequently women were recognized as an important audience for these media shortly after their inception. For

instance, much of the early television programming centered on the home, that medium's central locus of consumption (Spigel, 1992).

In contrast, while women did run early printing houses and wrote for newspapers and political journals, men were often at the forefront of print media production and use. The fact that men were recognized as the primary practitioners of and audiences for news in the eighteenth and nineteenth centuries has, in part, contributed to the gender-blind approach in histories of print media. However, scholars like Christopher Wilson (1985) have convincingly demonstrated that movements within journalism including muckraking were linked to particular understandings of masculinity. In particular Wilson shows that writers like Jack London and Upton Sinclair conceived of their work as fact-based yet actively engaged with the social world and strove to embody the Rooseveltian ideal of the strenuous life and the man of action. Thus gender operates within journalism as a coding of its primary forms as either masculine or feminine. If early twentieth-century muckraking appealed to a particular form of masculinity, stunt reporting in which journalists disguised themselves in order to turn up secrets about closed institutions like mental asylums (as Nellie Bly did in her reports for the *New York World* in the late 1880s) was a predominantly feminized news-gathering mode.

It is important, then, for media historians to think more rigorously about the importance of gender to media history. Within the history of technology it may be difficult to see how gender might figure in accounts of technologies along the lines of Marshall McLuhan (1964) or Friedrich Kittler (1999), theorists whose broad strokes leave little room for social actors. Yet against such technological determinism are studies that show how deeply embodied and engaged in the production of identities technologies are. Ruth Schwartz Cowan's *More Work for Mother* (1983) demonstrates that the supposedly efficiency-enhancing domestic technologies of the industrial period in fact created more work for women, ensconcing them further in the domestic sphere. Carolyn Marvin's *When Old Technologies were New* (1988) shows that communication technologies are always connected to bodies that are themselves traversed by gender, race, and class. As Lacey (1997) puts it, "gender issues are always critical to and implicit in the relationship between the technological potential and the social application of a new medium" (p. 245).

Women as Media Producers

A major area of inquiry within the history of media/gender/sex is that of women as mainstream media producers. Much of the work that falls within this area is recuperative. That is, it seeks to recover the unwritten, forgotten, or marginalized history of women's participation in the media field as active practitioners within mainstream journalism industries. Attempting to remedy accounts like Emery et al.'s history of the American press that focuses primarily on the accomplishments

of male printers, editors, and reporters, many of these studies recreate the history of news from the perspective of *her-story* (Scott, 1999). They seek to correct what is perceived as a male bias not only within media industries, but within the enterprise of writing history itself. In her study of nineteenth-century British women reporters and editors, Barbara Onslow (2000) suggests that “outside the cohort of specialist scholars, women’s collective contribution to journalism has largely gone unregarded” (p. 1). Onslow and others offer a corrective in the form of women’s history, seeking to render the involvement of such writers, reviewers, and editors visible.

Works like Patricia Bradley’s *Women and the Press: The Struggle for Equality* (2005) foreground the accomplishments and experiences of American women journalists and editors like Cornelia Walter and Margaret Fuller while chronicling the discriminatory practices and private sphere ideology that kept most women out of newsrooms until the 1970s. Bradley connects the workplace struggles of women journalists to contemporaneous nineteenth- and early twentieth-century movements for women’s suffrage and, later in the book, to late twentieth-century activism around women’s liberation and equal rights. Similarly, Maurine Beasley and Sheila Gibbons’s *Taking Their Place: A Documentary History of Women and Journalism* (1993), first published in 1977 as *Women in Media: A Documentary Source Book*, credits the women’s movement of the 1960s and 1970s for unveiling many of the sexist attitudes held by male publishers and editors about newswomen (e.g., that they were too emotional to write “hard news” or would inevitably quit when they got married) and documenting widespread discrimination and gender disparities within the nation’s major media organizations. Emboldened by women’s liberation, in the 1970s women in print and broadcast journalism filed protests with the Equal Employment Opportunity Commission and launched class-action sex discrimination complaints against such media outlets as the *New York Times*, *Newsweek*, *Washington Post*, Associated Press, NBC, and *Reader’s Digest* (Beasley & Gibbons, 1993, p. 26). *Taking Their Place* offers excerpts of women’s reportage from the colonial era to the present, with prefaces describing the conditions of women printers and reporters in each era.

Studies that fall within the her-story framework also include Sharon Harris and Ellen Gruber Garvey’s *Blue Pencils and Hidden Hands* (2004), a fascinating collection of articles highlighting the work and accomplishments of women editors in both advocacy and general-interest periodicals between 1830 and 1910. The book includes chapters on pioneering women like Frances Wright of the *Free Enquirer*, Pauline Hopkins of the *Colored American Magazine*, and Mariana Burgess of the *Indian Helper*. Along the same lines, Janice Fiamengo’s *The Woman’s Page: Journalism and Rhetoric in Early Canada* (2008) analyzes the work of six prominent nineteenth- and early twentieth-century women writers and reformers in English-speaking Canada, including Agnes Maule Machar, Sara Jeanette Duncan, and Nellie McClung. As a literary scholar, Fiamengo looks closely at these women’s work and asks “how each of them created a public voice.” Fiamengo’s book emerges from the literary and rhetorical

tradition, as she is concerned with questions about each writer's "sense of purpose, relationship to their audience, and self-presentation," in addition to their use of analogy, metaphor, and persuasive techniques (Fiamengo, 2008, pp. 6–7).

Authors that offer a more focused look at women in television news include David Hosley and Gayle Yamada (1987) and Marlene Sanders and Marcia Rock (1988). Donna Halper's *Invisible Stars: A Social History of Women in Broadcasting* (2001) utilizes newspapers and magazine stories as well as interviews with relatives to reconstruct the lives of the many forgotten women who helped to shape radio and television starting in the 1920s. Halper's two fixed sites are broadcasting and women, but she casts her social history widely. Thus she considers not only women who had an on-air presence, but also the production and marketing of radios and television sets for women, the participation of women in radio electronics, the appointment of Frieda Hennock as Federal Communications Commission commissioner, and the rise of Bertha Brainard at NBC, while connecting women's changing roles in broadcasting to broader historical contexts.

All of these studies provide a necessary remedy for the male-centric understanding of press history, which ignores the critical contributions made by women. However, many of these recuperative narratives of women in the media do not approach gender as a social and cultural construction and instead interpret the category "women" quite literally as not only a sociological but also a biological reality. A notable exception is Jean Marie Lute's *Front-Page Girls: Women Journalists in American Culture and Fiction, 1880–1930* (2006). While not as broad a chronicle of the achievements of women journalists as some of the works discussed above (the book focuses on only a handful of the most famous women journalists, like Nellie Bly and Ida B. Wells), it offers an important cultural analysis of specifically feminized reportorial forms like stunt reporting and so-called sob sister journalism. Lutes argues that the women who were allowed access to the male sphere of journalism were often forced to use their bodies as instruments of sensationalism in order to draw readers' attention to their stories. While their stories were rendered orthographically, these reporters' bodies became an integral part of their work and the publicity surrounding it (in fact, the epithet "sob sister journalism," often used to describe women reporters in the early twentieth century, draws attention to the supposedly intrinsic emotionality not only of the topics they wrote about but of the women writers themselves). Bly, for instance, found commercial success and fame by adopting the persona of a working-class immigrant woman and feigning mental illness in order to gain access to Blackwell's Island women's insane asylum. Her body was central to the story she told about this experience, which was serialized in the *World* and prompted other city papers to hire their own "girl stunt reporters."

Lutes is also attentive to the role of racial difference in the treatment and reception of nineteenth-century women reporters. She argues that underlying stunt reporting was a "drama of endangered whiteness" that African American journalists like Wells could not imitate and actively "wrote against." Because of her status as both a woman and an African American living in a violently racist society, it was incumbent upon

Wells to personify her “race’s intelligence, virtue, and promise” and cultivate a style that emphasized rational argumentation devoid of sensationalism (Lute, 2006, p. 40).

Advocacy and Activist Media

While a majority of the histories of women as media producers have focused on women’s involvement in the mainstream commercial media, a handful of important studies of women-produced periodicals have been published in recent years, many of them focusing on the suffrage press in Britain (DiCenzo, Delap, & Ryan, 2011; DiCenzo & Ryan, 2007; Tusan, 2005) and the United States (Solomon, 1991). In *Feminist Media History: Suffrage, Periodicals, and the Public Sphere*, Maria DiCenzo, Lucy Delap, and Leila Ryan distinguish what they call “feminist media” from the domestic content and advertising that filled women’s magazines, and point out that the former has been a surprisingly neglected area in the study of late-Victorian and Edwardian periodicals (DiCenzo et al., 2011, p. 3). However, as Michelle Tusan argues, the label “feminist media,” while perhaps an apt description of suffrage periodicals, does not capture the entire range of women’s nineteenth- and early twentieth-century activist publications:

although a good deal of overlap is evident, the women’s press was not necessarily synonymous with what historians such as Philippa Levine have called the “feminist press.” The voices of the women’s press, despite declarations that each promoted women’s interests broadly defined, included many groups that were disassociated from a feminist or protofeminist agenda. Religious organizations, advocates of temperance, sexual restraint, and moral reform all had their own women-run printed mediums. (Tusan, 2005, p. 5)

Because of the diversity of women’s activist publicity in both Britain and the United States, it is a misnomer to consider the range of advocacy periodicals feminist media. Harris and Garvey (2004), for instance, consider a wide range of nineteenth-century women-produced religious and multicultural media that were activist, but not feminist, in orientation.

Scholarship on women’s activist media draws heavily on feminist iterations of Jürgen Habermas’s (1991) theory of the public sphere as a site that exists between the state and the private sphere. Habermas argues that the press was a key component of an emerging eighteenth-century liberal public sphere. For Habermas, this public sphere of uncoerced critical rational debate flourished through the Western European and American revolutions but was corrupted by an increasingly commercialized mid-nineteenth-century press and, in the twentieth century, by the rise of an institutionalized welfare democracy. In an ideal public sphere, the press is an overtly political site where diverse people come together as equals to debate pressing matters.

Because reason triumphs over other means of establishing authority (like wealth and status) in the public sphere, individuals are judged solely by the quality of their arguments.

Feminists like Mary Ryan (1992) and Nancy Fraser (1992) argue that the concept of the public sphere is a useful way to designate processes of deliberation and political action that bear upon but occur outside of official state apparatuses. However, they point out that Habermas's initial formulation (which he has since revised) imagined diversity where there was in fact homogeneity: debates occurring in the liberal public sphere were discussions among elite White men who actively sought to exclude the participation of women and racial/ethnic minorities. As Ryan (1992) puts it, "women were patently excluded from the public sphere [...] and were even read out of the fiction of the public by virtue of their ideological consignment to a separate realm called the private" (p. 260).

To correct this bias within Habermas's original formulation and to make the public sphere concept match the actual historical record, Fraser (1992) posits a multiple public sphere model. The existence of eighteenth-century alternative social movements that operated alongside or in opposition to the liberal public sphere has been documented by the revisionist historiography of Ryan and other social historians. Fraser (1992) argues that these movements created counterpublics that have taken the form of "nationalist publics, popular peasant publics, elite women's publics, and working-class publics" (p. 114). Historians of media/gender/sex have found Fraser's formulation useful because concepts of the public sphere offer a role for the press and the notion of counterpublics brings the efforts of oppositional movements, like feminism, into relief. Oppositional media play a two-step role within this literature. First, they provide a focal point for the creation of new forms of political consciousness and community. Second, they become tools of publicity that carry the counterpublic's agenda to broader audiences.

Scholarship on women's suffrage and advocacy media has shown how the alternative publications these social movements produced helped create a modern political consciousness among women (DiCenzo et al., 2011; Tusan, 2005). Likewise, in her discussion of African American newspaperwomen, Lutes (2006) suggests that journalists like Wells "acted as conduits for and representatives of a black counterpublic that was being nurtured by an abundance of black newspapers in the late nineteenth century" (p. 43). Recent work on the rise of LGBTQ weeklies, magazines, and radio programs like Rodger Streitmatter's *Unspeakable: The Rise of the Gay and Lesbian Press in America* (1995) and Phylis Johnson and Michael Keith's *Queer Airwaves: The Story of Gay and Lesbian Broadcasting* (2001) do not explicitly deploy Habermasian formulations, but nonetheless demonstrate the critical role alternative media have played in articulating LGBTQ identities and fostering alternative political communities.

Some scholars have critiqued Habermas and Fraser from the perspective of feminist media studies. Lacey (1997), for instance, suggests that in appealing to reason, Habermas offers a limited model of truth-bearing practices. He "falls back on universal principles in the contention that all particularized motives and interests are

bracketed out in order for this discussion to take place, reproducing the dichotomy between reason and sentiment or interest, reinforced by the emphasis on verbal discourse to the exclusion of physical or emotional expression, rhetoric or gesture” (p. 225). Lisa McLaughlin (1993) fears that analyses of oppositional enclaves suggested by the notion of counterpublics will overshadow a sustained analysis of the ways the mainstream media complicate the ability to attain oppositional identities. She argues that in much feminist work on the public sphere the media are given short shrift in that they are viewed only as tools of publicity. Within feminist media studies the oppositional may become overly valorized while the mainstream, which wields ever more power, gets lost in the analysis.

Indeed, the concept of the public sphere is at its best when chronicling media produced by alternative movements and these groups’ attempts to bring critical political issues to the attention of broader national audiences. The notion of publics or counterpublics has been less useful for analyzing the material and ideological effects of mainstream media content that utilizes gender, race, and sexuality as its “raw material.”

I would add to the above critiques that approaches that both draw on and critique Habermas presume that debates and discussions that occur in mainstream or countermedia take a similar form and are shaped by similar forces as conversations that occur between individuals in primary publics. That is, the question of who is being represented and what is being said is determined solely by who is speaking and how much power they have. This begs the question of how media function as institutions, and how these institutions are embedded within and interact with political groups, economic and financial institutions, and social movements. Thus these arguments run the risk of reducing the complexity of social conflict, and of the relationship between power and knowledge. To further understand how discourses are shot through with power, one must turn to the relationship between media institutions and representations.

Gender and Sexuality as Media Content

Feminists have been concerned with representations of women in the mainstream media since at least the 1963 publication of Betty Friedan’s *The Feminine Mystique* (2001). While the vast majority of feminist scholarship in this area focuses on contemporary media texts, media historians have also shown an interest in this topic. Works that analyze representations of women and women’s issues in the media from a historical perspective include Katherine Adams, Michael Keene, and Melanie McKay’s *Controlling Representations* (2009), which looks at 50 years of the *New York Herald* (later the *Herald Tribune*) to see how women were depicted in that newspaper. The authors find that in each decade studied the paper put forth shifting and often contradictory representations of the ideal woman. Barbara Freeman’s *The Satellite*

Sex (2001) analyzes media coverage of women's issues between 1966 and 1971 in the English Canadian media covered. The author demonstrates that even in this seminal five-year period in Canadian history, the press favored domestic-minded women as sources and authoritative voices and sought to discredit the views of activist women.

Works that critique dominant representations of women provide useful fodder for anti-sexist struggles, but they tend to appeal to a kind of identity politics that ignores the experiences (and media representations) of women of color. There a germinal but fruitful field of media history promises to expand our understanding of the role gender, sexuality, and race (as mutually imbricated categories) have played in both the rise of social institutions like journalism, medicine, and law enforcement and also in the production of marginalized and policed identities. This work draws, implicitly or explicitly, on the understanding of intersectionality advanced by critical race theorist Kimberlé Crenshaw, who noted that anti-sexist and anti-racist (and we could add class) struggles treat gender and race (and class) as separate categories. Crenshaw (1991) points out that the "intersection of racism and sexism factors into Black women's lives in ways that cannot be captured wholly by looking at the race or gender dimensions of those experiences separately" (p. 1244).

An anthropological study that considers race and gender in mass media that could in these terms be classified as intersectional is Catherine Lutz and Jane Collins's *Reading National Geographic* (1993). Through a detailed content analysis and analysis of visual forms found in *National Geographic*, the authors find that though the magazine purports to broaden viewers' understanding of non-Western peoples and cultures, its content and imagery are predominantly presented from the perspective of the White male gaze. In a similar vein, Ella Shohat and Robert Stamm's (1994) voluminous interrogation of the history of Hollywood films reveals that the history of filmmaking is rife with ethnocentric and orientalist imagery. In particular they look at sexualized tropes in which gender and race are combined through exoticism.

The project of theorizing the ways in which press narratives of gender, race, and sexuality are constitutive can even be seen in the 1890s in the work of Ida B. Wells (1997), whose crusading anti-lynching journalism indicted trumped-up narratives of White women's sexual victimization at the hands of Black men, which were used by White newspapers to justify vigilante attacks on Black men. The lynching of Blacks by White mobs was a way to punish those Blacks who dared resist the Jim Crow laws that had sprung up across the South in the 1890s, yet White men rationalized their violence through an appeal to the preservation of White womanhood. Wells not only demonstrated how the mainstream Southern press was a vehicle for promoting a White male vantage point as universal, but she also critiqued anti-miscegenation laws that posited that mutually desiring relationships between Black men and White women were unnatural and therefore criminal. Wells documented cases in which White men who sexually assaulted Black women (and young girls) were rarely charged with a crime and those who were tended to be acquitted by juries composed of White men.

More recently, intersectional approaches in media history scholarship have provided fertile ground for understanding how mainstream media have historically produced narratives that weave together race, gender, and sexuality in ways that promote elite male interests. Lisa Duggan's *Sapphic Slashers: Sex, Violence, and American Modernity* (2000) considers the sensationalistic serialized 1892 newspaper coverage of the trial of Alice Mitchell, who killed her lover Freda Ward in Memphis (not coincidentally, Duggan argues, the same year Wells was run out of that city for distributing her anti-lynching work). She argues that the overlapping of the "lynching narrative" and the "lesbian love murder story" revealed "a threatened white masculinity concerned to reconfigure political, economic, and domestic order in the face of change and challenge in race and gender relations." While she does not argue that these stories were in any way commensurable, given the overwhelming violence the lynching narrative incited, Duggan does suggest that as these narratives proliferated in US mass culture, they shifted the ground of debate over same-sex desire and lynching "away from the grounds of politics and citizenship and [toward] those of morality and normality" (Duggan, 2000, p. 155). The stories the Mitchell affair and the lynching narrative generated helped to delineate the boundaries of citizenship in the 1890s through the production of sexual and racial deviants who stood as outsiders to the public sphere.

Carol Stabile's *White Victims, Black Villains: Gender, Race, and Crime News in US Culture* (2006) looks at the central role crime coverage has played in constructing the Black villain as a salient political category. Her analysis of newspapers from the 1840s to the 1990s demonstrates that if crime reporting cast Blacks as perpetrators of crime, it simultaneously constructed victimhood as a status that could only be held by Whites, particularly White women. Throughout her analysis gender and race are culturally produced in relation to one another and within fields of power. Stabile (2006) writes that "race and gender are among the most important sites for struggles over the historical meanings assigned to deviance. Indeed, the powerful efforts on the part of social orders to strictly police the boundaries of these categories [...] speak to the strenuous ideological and cultural work required to construct categories of gender and race and manage their meanings" (p. 5). This work demonstrates that current understandings of gender and race are always the product of historical residues.

Helen Benedict's *Virgin or Vamp: How the Press Covers Sex Crimes* (1992) also considers the production of worthy and unworthy victims by the media. After a chapter chronicling the depiction of rape in the press from the nineteenth century through 1970, Benedict offers detailed analysis of four high-profile rape cases occurring in the 1970s and 1980s. She finds that in all of these cases the press effectively put the female victims on trial, either deeming them worthy as victims through an appeal to their innocent, virginal status, or incriminating them by prying into their lives and asserting their prior sexual promiscuity. In the view of the press, the promiscuous "vamp" cannot be raped. Benedict's book constitutes not only an analysis of past and present coverage but also an argument for how journalists should cover sex crimes. The

author proposes that “rather than feeding fears, myths, and misconceptions” reporters should create balanced news coverage that places individual cases in the context of statistics about rape and explanations of why the crime of rape occurs from “researchers, literature, and other victims” (261). Further, reporters, often harried by deadlines, should not resort to exploiting “the victims or their families by . . . including prurient, irrelevant, or unattributed facts about their family lives” (Benedict, 1992, p. 162).

The Gendered Audience and Consumer

Within the literature on women as audience members and consumers, there are a number of significant studies about the rise of a mass consumer culture at the turn of the last century. Kathy Peiss’s *Cheap Amusements* (1986) focuses on how the rise of commercialized leisure establishments in New York City altered the social landscape for first- and second-generation working-class immigrant women. Peiss argues the rise of affordable, heterosocial amusements like dancehalls, theaters, and amusement parks reconfigured public space and carved out a space of autonomy for working-class urban women that they did not possess before. A number of works consider the construction of women readers or viewers (Beetham, 1996; Butsch, 2000; Flint, 1993; Garvey, 1996; Harp, 2007; Lacey, 1997; Mehaffy, 1997). Ellen Gruber Garvey’s *The Adman in the Parlor* (1996) proposes that late nineteenth-century women readers had to be “trained” by reduced-cost mass-circulation literary magazines to pay attention to their advertisements. Her fascinating study looks at consumer–advertiser interactions in order to understand the “complex interplay between fictional narrative and advertising” (Garvey, 1996, p. 184). One chapter examines women’s scrapbooks, many of which contained clippings of advertisements from magazines, as a window into how advertisements were read and interpreted in the 1880s. Another chapter considers the dual use of “advertising contests” in the 1890s, which were intended to both capture women magazine readers’ interests and also serve as proof by magazines that women were actually reading the back-page ads placed in literary magazines.

Dustin Harp’s *Desperately Seeking Women Readers* (2007) traces the ways in which the US newspaper industry has sought to court readers from the 1890s to the present. In particular it looks at the rise of the woman’s pages, sections in newspapers devoted specifically to “women’s content” – news of fashion, gossip, and tips on childrearing and household management. Originally intended to capture a new readership in the 1890s, by the 1970s debates were underway about whether these pages in fact marginalized women and prevented this important demographic from identifying with the paper in its entirety. Beginning in the 1970s, feminists began arguing that the women’s pages were demeaning to women, confining them to a largely household role that did not mirror women’s actually expanding opportunities in public and

political life. As a result of their agitations, but also as a strategy for drawing more women in as readers, newspapers abandoned the women's sections. Harp notes that these women's news sections reemerged in the 1990s in papers like the *Lexington Herald-Leader* and the *Chicago Tribune*. Ultimately, Harp (2007) argues for integration as opposed to segregation of women's news, arguing that the redirection of some news items out of general-interest sections and into special women's sections "reinforces age-old stereotypes about gender and a gendered public/private dichotomy" (p. 109).

Susan Douglas's cultural history, *Where the Girls Are: Growing Up Female with the Mass Media* (1994), focuses on the effects of media on women audiences. Douglas contends that popular culture, described in much of the literature in this chapter as a site for the production of deviance and reactionary or apolitical social actors, and particularly as an anti-feminist force, in the 1950s and 1960s actually contained the seeds of the women's liberation movement. Without the films, television programs, and pop music of the 1950s and early 1960s, Douglas contends, the second wave of feminism would never have occurred. She claims, "the war that has been raging in media is not a simple war against women but a complex struggle between feminism and antifeminism that has reflected, reinforced, and exaggerated our culture's ambivalence about women's roles for over thirty-five years" (Douglas, 1994, pp. 12–13). While Douglas points to the anti-feminist news clips about bra-burning feminists and the valorization of housewives' voices over activist ones, she argues that the terrain of popular culture is more contested and reflective of social life and the everyday challenges women face. While the mainstream media may not have created the oppositional publics of the 1960s and 1970s, Douglas argued that they played a role in promoting them.

Though it is not explicit on this score, Douglas's work suggests that there is an interdependent, but at the same time oppositional and productive relationship between mainstream and social-movement media. Indeed, there is often a reciprocal relationship between social movements, the media they produce, and the mainstream media in which the two seek not only to defy one another but to court one another. Thus mainstream media target feminist social movements as potential mass audiences, while social movements target mass media alternately as villains, sites of activism, and nodal points for the promulgation of their points of view (Soderlund, 2012).

Conclusion

What are the critical elements of a media history that is responsible to gender and sexuality? First, gender should be central to all histories. It cannot be a separate and marginalized topic because, as Scott has shown, even traditionally masculine discourses are shot through with gendered imagery, concepts, and assumptions. There

needs to be an increased awareness among all historians that the process of signification through which narratives are constructed is heavily gendered. Second, more work needs to be done on histories of the media and sexual identity. The paucity of historical works on LGBTQ media suggests that this is the most serious deficit in the subfield. Third, there is a need for work on the history of feminist, women's, and other social movements and their relationship to mainstream and "alternative" media. Specifically, this work should consider the interplay between these two competing media as oppositional but also synergistic entities. The kinds of messages that are produced should not be treated in isolation, but in relation to media institutions and broader political and legal events.

The History of the Book

Ronald J. Zboray and Mary Saracino Zboray

ABSTRACT

Since most media historians have yet to engage fully the history of the book (HOB), this essay provides a critical introduction to the approach. It discusses the approach's problematical object of study and characterizes its current practice as a postmodern performance of liberal "cultural poetics" rejecting grand narratives, whether the radical history of capitalism's emergence or the conservative history of ideas. We explain HOB's dynamics in terms of its emergence in the 1980s, which coincided with that of the history of the American book (HOAB). Both HOB and, particularly, HOAB were part of a "cultural turn" deployed by displaced intellectual historians against the New Social History (NSH), associated with quantitative or even systematic inquiry present in other national HOB traditions, especially in France's *Annales* School. Adopting the cultural history spirit of that tradition while replacing its research techniques with almost exclusively qualitative interpretation, HOAB also occluded a range of North American antecedents in journalism and literary studies, including bibliography, but in a way that put the latter to the service of cultural ends. As the new millennium approached, the HOB landscape shifted with the rise of reader-and-reception studies that reset the approach's course from books themselves to what books meant to specific end-users as evidenced in their literary practices. The essay concludes with an overview of approaches to print production (especially publishing and authorship), distribution, and consumption, in light of HOB's move from a producer to a reader orientation, as well as indications of – and recommendations for – the future direction of the approach.

The history of the book (HOB) has much to offer media historians. The book, after all, was arguably the first long-format mass medium; it set precedents for later non-book media developments. Books, too, have been seen as culturally germinal worldwide, especially in Europe and East Asia (Brokaw, 2005; Eisenstein, 1979; Kornicki, 1998; Son, 1982). The book heralded the transition from orality to literacy wherever it went (Easterling, 1985). Books, moreover, have variably facilitated community building, (in)formed publics, fueled revolutions, forwarded technologies, and, in general, fired imaginations, but they also have fostered ignorance and intolerance. All said, the book, for its long-standing originary power as a form of mediated communication, deserves special regard by media historians. (For an introduction to the approach, see Zboray & Zboray, 2000.)

HOB as an approach, however, has not been widely embraced by them.¹ This essay aims to remedy that by sketching out what HOB entails, albeit with a critical perspective to make it useful for media historians, who may find it off-putting for its argot and, to them, too obvious findings (like the medium influences the message). One book historian even waggishly dubbed HOB the “new boredom” (Kastan, 1999, p. 18). Because of its ungainly fit with media studies, the discussion below goes beyond merely describing the approach to situating it in its scholarly context as a practice. The concluding sections selectively present approaches to print production, distribution, and consumption, which media historians may find useful.

HOB is founded on a duality it shares with studies of other forms of media, for its object of study is at once economic and cultural as a material conveyancer of textual (and visual) meaning (Gilmore-Lehne, 1989, p. 255). “The book,” as fundamentally a material artifact, required work to produce, wherewithal to circulate, and willingness to consume. It is thus heuristically amenable to analysis, like any other commodity, in its sequence of production, distribution, and consumption or in some other form of schematic representation of circuitry.² Culturally, however, a term like “consumption” becomes metaphorical, not literal; reading, for example, is not exactly like eating or other types of consumption (Price, 2009, pp. 122–123; Radway, 1986). Moreover, culturally considered, book production, distribution, and consumption overlap to the point at which distinctions among them fade.³ To wit:

- Every author is inevitably a reader (Darnton, 2009, p. 180).
- Editors not only produce but “consume” and distribute (Harris & Garvey, 2004).
- The pattern of circulation helps produce the book’s received meaning (Ogborn & Withers, 2010).
- Publishers’ advertisements can precondition reception (Wigelsworth, 2010).
- Non-literate people can participate aurally and orally in book culture (Fox, 2000).
- Purchasing, owning, borrowing, shelving, and reading books are distinct practices – irreducible beneath a single consumption rubric, yet also partaking of distribution – that can coincide in the same family or individual (Colclough, 2000; Gilmore-Lehne, 1989, pp. 255–269).
- And readers, as they discuss the text, reproduce their version of it, becoming virtual co-authors (Long, 1993).

Books can be paratextually iconic (Bornstein & Tinkle, 1998), auratic (Brandes, 1998; Rodger, 2008), or totemic (Cressy, 1986), aside from anyone reading them. Books received as gifts can become tokens of the giver and valued and beloved more for their associations than for their texts (Davis, 1983; Zboray & Zboray, 1996). Ideas nested in books can take wings far beyond the covers, diminishing the salience of book sales or production data (Raven, 1998, pp. 276–278; Zboray & Zboray, 2006).

HOB distinguishes itself from earlier print culture approaches by self-consciously embracing the cultural aspects of its object of study, without jettisoning the material realities underpinning its production, distribution, and consumption. True, the approach's materialism elides political economy (exceptions include Frankel, 2006; Jackson, 2008; St. Clair, 2005; Whalen, 1999; Zboray, 1993; Zboray & Zboray, 2005). HOB's resistance to structural analysis of socioeconomic power relations supports its postmodern cachet sometimes at odds with its almost premodernist print triumphalism (Basbanes, 2005; Piper, 2009, p. 5). For practitioners, the book is key to unlocking the cultural history of a given time and place, and that provides the main rationale for studying it.

Problematical Definitions

But what is HOB's object of study? It may seem obvious, but the answer is far from certain (Hench, 1994, p. 15). One problem is that the book antedates printing (Diringer, 1982). The manuscript book remained vital well after Johannes Gutenberg's Bible of the 1450s (Johns, 1998) and Korea's development of metal movable type perhaps two centuries earlier (Son, 1982). Manuscript books not only circulated as single unique copies, but, rather, scribal duplication in scriptoria could yield multiple handwritten copies (Love, 1993). The manuscript production system was initially near-equivalent to print in productive capacity and textual accuracy (Crick & Walsham, 2004; Johns, 2003).⁴ The book's genealogy in the West goes back much further to ancient Roman codices (ca. first century CE), but long-format works in its media predecessor, the scroll (ca. 2,400 BCE, Egypt), also were called books (Roberts & Skeat, 1983). Books could be subdivisions of longer texts, too (Haran, 1993, p. 61). To complicate matters, the first printed book that can be firmly dated, to 868 CE in China, *The Diamond Sutra*, was produced on a scroll (Wood & Barnard, 2010). Thus, a long lineage of prior media forms converged into the modern book.

Historically, then, "the book" is a floating signifier unmoored to any specific type of artifact *per se*. Instead, it has transcended its differing contingent manifestations to become, across time and space, a cultural trait of cognitive expectations and related information-organizing behavior, with a variable material print or scribal referent, that can make meaningful large, detailed, and complex fields of text and other visual matter presented on the page.⁵ HOB has thus moved beyond an initial object-centered orientation toward a recent focus on reading and other forms of reception – from

what books have been, to what they have meant (Chartier, 1994; Zboray & Zboray, 2000, pp. 5–8, 79).

Yet HOB encompasses more than books. Included in its scope are just about all print artifacts (e.g., newspapers, magazines, pamphlets, posters, broadsides) and, increasingly, those of a non-typographic scribal nature, as well (West, 1998).⁶ Of course, the information field of single-sided broadsides or posters may not be large, detailed, or complex, but it would be perceived through its similarity to more extensive formats (Twyman, 2008). Indeed, it is difficult to separate any particular item conceptually – because of its commoditization within the “world of goods” (Kopytoff, 1986; Zboray & Zboray, 1996) and intertextual relationships to other books (Orr, 2004) – from the expansive universe of print and scribal production, dissemination, and reception it participates in. Any single book is both a synecdoche of this bibliographical intertexture and a unique conversational node within it. In short, as long as the object of study is rooted in a material artifact conveying textual (and visual) meaning on pages receptive to ink, it has fallen within HOB’s scope.⁷

Obviously that is an almost incomprehensibly vast base of objects for study. It at least begins to answer the “what” question in HOB’s definition. Widening that definition even more, HOB also examines not just the object, but also the processes of producing, distributing, and consuming it (e.g., the “sociology of texts”; McKenzie, 1999). “How” the book is studied narrows the definition: a contextualism that materializes *and* culturalizes the book amid the processes leading to its appearance and continuing presence within a particular media ecology.

Navigating between cultural materialism (Prendergast, 1995) and a traditional history of ideas (Lovejoy, 1936) has made HOB, for many practitioners, an exercise in liberal cultural poetics, avoiding both grounded radicalism and ideational conservatism.⁸ Consequently, the approach has a postmodernist performative dimension, often expressed as a recoil from master narratives (Lyotard, 1984) and a corresponding penchant for anecdotal storytelling (*le petit récit*), in a conspicuous display of scholarly-ness. The writer summons broad interdisciplinary literatures in a scholarship-saturated performance of “interpretative freedom” (Howard, 2007). Book history, in resisting determinations by larger socioeconomic structures, invites a reception mode of imagined historical possibility that might otherwise have been foreclosed. Such symbolic reassertion of aesthetic–historicist scholarly values (Jacoby, 1992, p. 408) laudably contradicted the mounting anti-intellectualism (Ross, 1989) and conformist corporatism (Molina & Rhodes, 2002) of the twentieth century’s last few decades. However, it neither challenged the period’s regnant neoliberalism nor absorbed the afterglow of the post-1968 New Left (Elbaum, 2002), either or both of which might have given the field greater theoretical depth. This deliberate “depthlessness” (Jameson, 1991, p. 12) is but part of HOB’s postmodern performance aesthetic.

Such poetics, for example, shape Robert Darnton’s (1984) swirling scholarly arabesque on a retrospective printed account written by a journeyman-artisan about a great cat massacre in a 1730s Parisian printing shop. The essay’s setting and attention to the everyday work of printers (with little bibliographical analysis of the

reminiscence as a printed artifact) is all that marks it out as HOB. In the essay, Darnton thematizes “workers revolt” as an amusing narrative framing device, not a serious engagement with the history of class struggle that the felinicide signified (Mah, 1991). Thus, poetics trump rhetoric; his essay does not really argue anything. Instead, it aims, according to Darnton’s peroration, to “recapture [. . .] laughter, sheer laughter, the thigh-slapping, rib-cracking Rabelaisian kind, rather than the Voltairian smirk with which we are familiar” (Darnton, 1984, p. 101). Darnton, echoing William Blake’s poem “Mock on, Mock on Voltaire, Rousseau” (1982, p. 177), thus deploys his anecdotal conceit to de-rationalize and de-philosophize France’s pre-Revolutionary era. At the same time, like most other scholars in the field, Darnton does not reflect upon the paradox of *writing a book* about book history – he leaves no reflexive opening for his book to be understood within its own peculiar system of production, distribution, and reception. That legerdemain aside, his poetics cut a middle ground between what could be a plausible workplace class-conflict analysis (Gutman, 1977; Thompson, 1963) and a situationally transcendent Lovejovian history of ideas.⁹

Obviously, not all HOB scholars do such dual-pole dancing, but many share with Darnton a descent from intellectual history and an aversion to left social history, which together create the academic performance space for their work. The blur between the intellectual and cultural, and the tension between the cultural/intellectual and the social may, on the surface, seem mystifying to all but cognoscenti, but it is rooted in the approach’s genesis in American academe, as discussed in the next section.

In other countries, different tendencies appear. British book historians, for example, remain closer to both conventional bibliography and social history than their American counterparts. The French combine quantitative analysis techniques with a more grounded than symbolic sense of culture than Americans. The distinction led one leading French book historian, Roger Chartier (1985), to criticize Darnton’s treatment of the cat massacre and later posit his own theory of “Frenchness in the History of the Book” (Chartier, 1988; cf. Smith, 1998). Ironically, the coming of print putatively enabled nationalism (Eisenstein 1979, vol. 1, pp. 117–118; McLuhan 1995, p. 243), so it seems to continue with print historians: these various national groups of scholars scarcely intersect and rarely cite one another’s work. Thus, generalizing about HOB risks reproducing the approach’s national boundaries. Yet because lococentrism shapes the approach, it cannot be ignored, either.

Origins in the United States

The approach’s disciplinary formation in the United States dates to a June 1980 landmark preconference of the Rare Books and Manuscripts Section (RBMS) of the Association of College and Research Libraries (ACRL) meeting in Boston. The venue is significant, for the ACRL membership had a special need to connect with academic

units on their campuses. It was felt peculiarly by RBMS members, for they had a narrower campus clientage, but also looked to national and international communities of scholars, while keeping close to book collectors and dealers. Simply put, the 275 preconference attendees wanted to hear of rare books' importance across disciplines. They would not be disappointed. For the first time in RBMS preconference history, the program brimmed with professors from academic departments outside of libraries, archives, and rare books (Nelson, 2009, pp. 42–44).

At the preconference, prominent book history scholars, including Darnton (he gave a version of his cat massacre paper there), Elizabeth Eisenstein, and Henri-Jean Martin, signed "The Boston Statement on the History of the Book," drafted by West German literary scholar Paul Raabe (Carpenter, 1983, pp. xi–xii). Both Darnton's *Business of Enlightenment* (1979) and Eisenstein's *Printing Press as an Agent of Change* (1979) had appeared the previous year. Martin was the *doyenne* of the French School, for which he named his *Histoire du livre* (1964); his co-authored *L'Apparition du livre* (Febvre & Martin, 1958) had appeared in English translation only four years earlier. Also contributing was G. Thomas Tanselle, representing the older tradition of bibliography (Gaskell, 1972). The Boston Statement claimed that the "historical study of society" (p. xi) was inseparable from book production and distribution (readers' reception was tucked inconspicuously into a dependent clause). It conflated society and culture (cf. Williams, 1958), however, calling "the book [. . .] by its nature a cultural force." Encompassing history, culture, and society, the Statement applied for the first time the term "history of the book" to this formation (Copeland, 2006, p. 128) with such insistence and prominence that it stuck permanently. Although the Statement leaves the book's relationship to ideas only implicit, most of the papers presented underscored that intellectual history as much as sociocultural history was at stake (Carpenter, 1983).

The preconference's injection of sociocultural considerations involved in the circulation of ideas represented a decisive departure from the field of bibliography (Spadoni, 2007; Tanselle, 1988). That field had found a home principally in library schools, but also in departments of English willing to tolerate the very historical detail-grubbers the New Critics reacted against in interpreting texts regardless of systems of production and even authorial intent (Greetham, 1996). Bibliography licensed reverse-engineering from typography and other features in the make-up of a specific book to the processes producing them; its intensive descriptiveness yielded a welter of details centripetal to the artifactual book. By contrast, this group of HOB founders was dominated by neither bibliographically minded librarians nor English-department footnoters, but by practicing historians of the generalizing, centrifugal ilk. Hence, this newly expansive bibliographically tinged HOB promised a more rigorous and comprehensive understanding of the sociocultural past. The Statement argued that it thus merited a correspondingly new set of institutions supported by government and foundation funding around the world.

The Statement's pervasive internationalism is often overlooked (e.g., Jenisch, 2003, p. 230; Shevlin & Lindquist, 2010, p. 60; cf. Gross, 1998, pp. 9–10). If the book is by

nature “a cultural force,” it is one “that transcends national boundaries.” Hence, “the design and compilation of basic tools require international cooperation” (Carpenter, 1983, p. xi). That, for HOB, would be a road less traveled (Suarez, 2003, pp. 147–149). Nationalism, not only of focus but approach, appeared during the preconference in the opposition, noted in the subsequently published proceedings by convener Kenneth Carpenter (1983), “between the Anglo American bibliographical approach and French *histoire du livre*” (p. vii). Indeed, the bristly, almost admonitory, volume introduction by Tanselle (1983) tries to rein in, with his bibliocentrism, the more expansive French approach instantiated in Darnton’s replacement essay for the cat-killing one, “What is the History of Books?” “For book history,” Tanselle (1983) insists, “the book is central, both as a physical object and as a conveyer of ideas” (p. xx). Darnton rejoins with his very different definition: “the social and cultural history of communication by print” (1982b, p. 65). The interchange signals a transitional moment from the old bibliography to the new HOB. The American HOB would become aligned with Darnton’s communication vision, though restrained and tempered by Tanselle’s bibliography – ideas nexus.

But what of the history of the *American* book (HOAB)? For that, the scene shifts to Worcester’s American Antiquarian Society (AAS), whose Dartonian plans in the 1980s for a “History of the Book in American Culture” would issue by the turn of the millennium in the five-volume, collaborative *History of the Book in America* (Hall, 1990, 2000–2010; Hensch, 1994)¹⁰ – thanks to the persistence of the project’s bibliographical advocates, “culture” would eventually become, as suggested by its disappearance from the title, less a topic subject and more of a referent effect. Before that denouement, however, the cultural approach, with bibliography as its handmaiden, accented with intellectual history, prevailed at the AAS. In fact, in the October following the RBMS preconference, the AAS hosted “Printing and Society in Early America,” a conference that would produce an eponymous volume of proceedings (Joyce, Hall, Brown, & Hensch, 1983). The book’s appearance coincided with the AAS launching its Program for the History of the Book in American Culture, under whose auspices the multivolume book project advanced, thanks to assistance from the National Endowment for the Humanities (Hensch, 2011).¹¹ That first conference volume and an ensuing one (Hall & Hensch, 1987) set the stage for the future HOAB.

The volumes’ highly eclectic set of essays spanned the range of what HOAB *could* be. Like Darnton’s cat massacre piece, it results overall in an impressive scholarly display with little argumentation. The research made clear one point: that the HOB was essential for understanding culture and society in early America. But this was a specific vision of what culture, society, and America was. Hence, the two volumes spoke for what HOAB *should* be, and that meant a certain partiality for a cultural history not far from the old intellectual history of the consensus-school sort. It would be a print history of a place (“America”), and not, as Darnton (1982b) had it, of a process: communication. Tellingly, the one paper presented at the 1980 conference that had the most to say to media and communication scholars, that of William Gilmore-Lehne (1980), did not make it into the conference volumes. In it,

he considered, foreshadowing Alasuutari's (1999) "third phase" of reception studies, the evolving popular meta-discourse of "speed, accuracy, and precision" concerning innovations in print production and distribution. Its view of changing print media's effects as discursively constructed stood opposed to that of one editor's published essay, based on autobiographies taken as fact, not discourse, which cast print instrumentalism as part of a "cultural style" (Hall, 1983; cf. Hoggart, 1957, p. 16).

Since 1980, then, *national* institutions like the AAS did indeed do their work as the RBMS's "Boston Statement" called for: multivolume projects were launched (Bell, Finkelstein, & McCleery, 2007; Fleming, Gallichan, & Lamonde, 2004–2007; Hall 2000–2010; Lyons & Arnold, 2001; Martin & Chartier, 1982; Maslen, 1993), fellowships and study grant money flowed (e.g., William Reese Company, 2008), and scholarly societies, conferences, and refereed journals emerged (see Society for the History of Authorship, Reading, and Publishing, 2010). HOB, by these outward signs, seemed to be a thriving interdiscipline, but there were residual limitations upon its influence from each national founding. The American case treated below is not alone in this, but it suggests, perhaps more clearly than any other, why the immense promise of the approach remains, in many disciplines, unrealized.

American Academic Politics and Founding Motives

HOB's and HOAB's emergence around 1980 coincided with the succession from the New Social History (NSH) to the New Cultural History (Cook, Glickman, & O'Malley, 2008) that took place from the late 1970s through the 1980s. The timing allowed book historians to participate in the so-called cultural turn (Bonnell & Hunt, 1999) to help justify their enterprise, albeit without fully embracing it – a half-turn. NSH came in several flavors, one of which was seeing history from the bottom up (Lemisch, 1967), in keeping with the movement's New Left roots. To recapture the lives and experiences of the putatively inarticulate working class, new social historians were unafraid to employ quantitative social science techniques (Wiener, 1989).¹² These historians challenged the earlier consensus view of US history, shared among leading intellectual historians in the 1950s, that diminished evidence of social conflict in the past (Bernstein, 1967; Higham, 1962). NSH also demonstrated that rags-to-riches upward mobility was far from universally true (Thernstrom, 1964). NSH, to some displaced intellectual historians gravitating to HOB, countered an affirmative myth of long-term national synthesis (Higham, 1989). Moreover, the myth-keepers, the consensus historians, were part of an influential establishment rooted in the expansive postwar US university.

Many HOB scholars, like intellectual historians, would define themselves against the NSH. Some in HOAB emerging from the history of ideas gestured toward materialism strategically to support superstructure over base (cf. Williams, 1973): ideas matter, but they have material means of circulation worthy of tracing. A material

history of ideas, like HOB, afforded intellectual historians cover from NSH charges of methodological imprecision (Gilbert, 1971, pp. 92–94).

A key event in this move was the 1977 Wingspread Conference of high-powered US intellectual historians in Racine, Wisconsin (Higham & Conkin, 1979).¹³ Among them was David D. Hall, who gave a paper on print culture in Puritan New England (Hall, 1979); he would become a HOAB driving force as general editor of the AAS's multivolume history, inflecting it with Wingspread's NSH reaction. After the conference proceedings appeared as a book, Arthur Schlesinger, Jr. (1980) damned it with faint praise: "a useful report that reflected the malaise that afflicted American Intellectual History in the 1970s" (p. 888). He also noted, along with the absence of citations to Eisenstein and but a single dismissive one to McLuhan, that "the indifference to Marxism is striking" (p. 890) – NSH was being sidestepped.

Intellectual history would find salvation in the emergence of the New Cultural History during the 1980s, as part of the "linguistic turn" (Miller, 1997, pp. 364–367), easily bringing HOB under its aegis, as witnessed in the rise of Robert Darnton. The same year that Eisenstein's book and the Wingspread essays appeared, his definitive publishing history of Diderot's *Encyclopédie* (1979) took European historiography by storm. Darnton followed with a string of volumes (1982a, 1984, 1990, 1995), all of which highlighted HOB. As a measure of his success, he would in 1999 head the American Historical Association – his presidential address concerned eighteenth-century Parisian media and news (2000) – and in 2007 he became the Director of Harvard University Libraries. He frequently speaks out on the necessity of preserving the book in the digital age (2009). Perhaps because of his national topic of study, however, he did not shy away from the quantitative-history "Frenchness" that Chartier (1988) had identified in his own book tradition, and that would very much set Darnton apart from most HOAB scholars (but see Gilmore-Lehne, 1989; Pawley, 2001; Winans, 1983; Zboray, 1993; Zboray & Zboray, 1997a, 1997c). At the same time, they would eschew both long-standing US scholarly precedents and, as Schlesinger (1980) perceptively discerned among the 1977 Wingspreaders, the McLuhan–Eisenstein spectrum that set the stage for their emergence.

French Origins, US Antecedents, and McLuhan–Eisenstein Precedents

Darnton naturally owes a great debt in his book history research to the *Annales* School, associated with the phrase "total history" (*histoire totale histoire événementielle*) that had its genesis under Marc Bloch in the 1930s. Under Ferdinand Braudel in the 1950s the school had moved to macro analysis of the *longue durée*, trends unfolding over centuries (Burguière, 2009). Book study became part of the *long durée* in Febvre and Martin's (1958) work on the book's fifteenth-century arrival, and a welter of subsequent studies followed from *Annalistes*. The group's approach to book history

could involve marshaling massive detail and undertaking quantitative analysis of book production and circulation, and that methodological rigor was expressed in the four-volume *Histoire de l'édition française* (1982–), edited by Martin and Chartier among others, which became the gold standard of national HOB projects, from the United Kingdom to New Zealand (and, of course, the US) wanting to tell *their* national story (Suarez, 2003).

Martin, Chartier, and Darnton, among other historians of the French book, benefited from this legacy of methodological rigor. Their work was based on multitudinous smaller yet intensive studies that had accumulated over decades, so the *Histoire* effectively synthesized highly systematic prior research, much of it quantitative in nature and, if not, still resulting from qualitative inquiry into vast data fields. HOAB simply did not have these traditions, but perhaps more crucial was that it was developed by a group reacting against the NSH that was itself distantly related to the *Annales* School (Fox-Genovese & Genovese, 1976).

As for local traditions, there certainly were prior historians of print culture for Americans to look to, beginning with Isaiah Thomas (1810), basically a collective biography. McMurtrie in the 1930s tried to generate interest in American book history through his publications and radio talks (e.g., McMurtrie, 1936), and that decade also saw the monumental *Book in America* (Lehmann-Haupt, Wroth, & Granniss, 1939), the product of bibliophile librarians. Coming from outside academe, this work was marginalized by the later HOB. One beleaguered group consisted of literary historians in US departments of English. The most prominent of these was William Charvat; from the 1930s until his death in 1966 he sought, in a series of articles and a slender monograph (1959), to establish a literary history grounded in authorship, publishing, distribution, book-reviewing and criticism, and to a limited degree, reading (1968). His work predicted the way literature scholars would adopt HOB in their work a half century later (e.g., Gilmore, 1999). Nevertheless, his map of literary history little fazed the later HOB (e.g., Winship, 1995, pp. 2–3).

From a very different disciplinary base came Frank Luther Mott, whose multivolume survey of American magazines (1930–1968) took nearly four decades to complete, and John Tebbel, who produced an equally gargantuan history of book publishing (1972–1981), polishing off the last volume around the time of the Boston Statement. Both were heavily immersed in journalism and mass communication education, at least in the last decades of their careers, and, thus, unlike the McMurtrie generation, were firmly ensconced in academe. So, it would have been natural for HOAB to encompass Mott and Tebbel followers and students in journalism history. But this, apart from a few exceptions, would not be the case.

Perhaps one reason was that the Mott–Tebbel tradition was systematic insofar as both tried for as complete coverage as possible of magazines and book publishing firms, respectively. Given the anti-NSH temper of HOAB originators, that seemed too much like the systematic inquiry they were acting against.¹⁴ Moreover, Mott and Tebbel were associated with social history and, as journalism historians, were not averse to seeing conflict as a perennial factor in US sociocultural life and press history

(Sloan, 1990, pp. 91–98). Such journalism historians, were, like later NSH scholars but in a different way, the wrong type for the new HOB.

Finally, HOB eschewed the spectrum of interest in print culture spanning from McLuhan's *Gutenberg Galaxy* (1962) to Eisenstein's *Printing Press as an Agent of Change* (1979). It may seem odd to pair them. Eisenstein's book, after all, was a self-avowed reaction (pp. x–xii) to McLuhan's supposedly imprudent celebration of the emerging electronic global village and the end of Typographic Man in his *Gutenberg Galaxy*. Both scholars, however, were epic visionaries open to the charge of technological determinism. So, although Eisenstein was present at the 1980 RBMS preconference and remained in the HOB fold, she became increasingly sidelined and, with Johns's (2003) attack on her presumed determinism, pilloried. American HOB scholars little tolerated any determinations limiting their poetics.

Indeed, their self-styling as the “history of the book” itself deliberately demarcates them from previous print culture investigators. Because the term is a literal English translation of *histoire du livre*, it redirects HOB's genealogy transatlantically away from conceivable North American forebears. But the term conveys more the redirection than it describes actual HOB practices, which have been selective, at best, in reflecting European scholarship. The genealogy the term signifies, instead, is the approach's descent from the peculiar form of intellectual history that, distinguishing itself from NSH, migrated to the New Cultural History during the 1980s as discussed above. Little wonder, that when a more open-minded and NHS-like group of University of Wisconsin scholars institutionalized in 1992, they dubbed their unit the “Center for the History of Print Culture in Modern America” (Pawley, 2008). The term “print culture” (McLuhan, 1960, pp. 75–79; Eisenstein, 1980) has become an antidote against the “history of the book” that has promulgated its own approaches to production, distribution, and consumption.

Approaches to Production

From its beginnings as a practice of study, HOB developed techniques for investigating production through two related foci: the author and the publisher. Some of these techniques were adapted from bibliography. For example, enumerative bibliography was summoned to establish not only the fullest recoverable range of titles by specific authors or publishers, but to map larger universes of print that gave material evidence of the distribution of intellectual activity. This allowed for more grounded generalizations about what types of books were available in any given time and place (e.g., Darnton, 1995), and how that universe expanded or contracted over time or changed in nature. Analytical bibliography's aforementioned “reverse engineering” that traditionally simply tracked imprint variants has been applied forensically to reveal production processes no longer recoverable by other means. For example, typography in Gutenberg's Bible, when subjected to computational analysis, suggests that the

movable type used was technologically evolving as the edition proceeded through the press (Agüera y Arcas, 2003). Textual bibliography, usually involved in comparing a text close to the author's hand to one further from it in pursuit of establishing authorial intent, has been employed by book historians to explore the cultural negotiations between authors and editors over perceived readerships instantiated in a specific edition (e.g., Thorne-Murphy, 2010).

HOB authorship studies were enriched from a different direction, that of literary biography (West, 1994). The conventional details about writing and placing manuscripts, shepherding them through the press, and engaging in book promotion, moved from out of the background in this research. An early example was Mary Kelley (1984), who delved into the personal papers of mid-nineteenth-century "literary domestics," popular "sentimental" female authors, to ponder the conundrum of private women performing on a public stage of publication. Shortly after, Anesko (1986) applied archival work to recast a canonical author, Henry James, from otherworldly to market-conscious. Such probing through archives and rare books repositories was soon applied to subliterate figures (Reynolds, 1988), even to convicted criminals having their say in print (Cohen, 1993). These efforts were joined by a few generalizing works based on author-archival materials on writing for the market (Newbury, 1997; West, 1988; Wilson, 1985), followed by wider-ranging considerations of authorship in a larger market culture (Ingrassia, 1998; Jackson, 2008; Zboray & Zboray, 2005). These have yielded some interest in "social authorship," that is, writers eschewing print but addressing, through manuscript production, known coterie of reader/authors (Ezell, 1999).

Similar archivalism has influenced studies of publishing, taking it far from previous anecdotal histories of publishers and their houses. Though only a few such records have survived proportionally to the number of houses that existed, those remnants have been intensively and systematically scrutinized, as Darnton (1979) did for the Société typographique de Neuchâtel, to pose the aristocratic origins of revolutionary ideas. Alexis Weedon (2003) pooled together vast internal business documentation to portray Victorian publishers adjusting production techniques to deal with mass market fluctuations. Publishers' archives can reveal author-publisher correspondence, accounts with printers, book distributors, or advertising agents, and cost accounting data suggesting the profitability of any given title, author, and genre.

Approaches to Distribution

Much of the material HOB researchers have called upon to investigate production touches also on distribution (Hackenberg, 1987). For example, records about where publishers advertised can suggest where they thought their books might sell, probably with good reason (Zboray, 1993, pp. 59–68) and such material also contains evidence of direct marketing, through salespeople (Thomas, 1998; Zboray & Zboray,

2005, pp. 131–139). Yet publishers' records scarcely identify end-users, but rather a host of middlemen, like wholesalers (Schurman, 1996) or bookstores (Wolf, 1988). Among these intermediaries are libraries, which although they purchase books like individual consumers, provide a service to readers, making patrons the end-users. No wonder that library history converged easily into HOB (Augst & Wiegand, 2001), as seen in the venerable *Journal of Library History* being renamed in 1988 *Libraries and Culture* (Wiegand, 1990). Some concerns, like nineteenth-century tract and Bible societies, pioneered systematic corporate recordkeeping for their distribution (Howsam, 1991; Nord, 2004, pp. 89–112). Distribution studies extend beyond individual houses to entire national literatures: Fabian (1976), for example, analyzed imprint checklists to establish the distribution of English-authored texts in eighteenth-century Germany.

Distribution is only one term applied to what happens to print matter between publisher and reader. Brown (1989) summoned diaries and newsclips to time the increasing reach and velocity of “contagious diffusion” of signal news stories from the American Revolution's start to the Lincoln assassination (pp. 245–267). “Circulation” is applied, of course, to periodicals and library items regularly in conventional parlance, but for HOB scholars, to books mostly in the preindustrial era; estate inventories have been scrutinized, for example, to suggest the extent of European titles in colonial Peru (González Sánchez, 1999). Such end-user-based evidence for print circulation also appears in Leonard's (1995) discussion of Depression-era Farm Security Administration photographs that reveal “elite” magazine covers on the walls of sharecropper shacks (p. 112) – one cannot read actual distribution from the seeming population a periodical addresses textually. A final term is “dissemination.” It owes to the history-of-ideas genealogy of book history, which is why the term turns up in science studies (e.g., De Renzi, 2000), but it has recently been applied to encompass after-market activities of readers or other users who might give quotes, clips, or entire books and periodicals to other people in their circles (Zboray & Zboray, 2006, pp. 71–147). “Dissemination” also acknowledges a book's “seeding” potential to influence minds, hence it gestures more than the other terms to reception.

Approaches to Consumption

Perhaps because “consumers” as a term evokes the cash nexus too much and suggests passivity, HOB scholars prefer “readers” to stand for all types of end-users. The move weakens the conceptual articulation between users and the system of production and distribution they engage, and so discourages economic analyses. To be sure, the printed book was imbricated in capitalist development: some measure of profit from selling to consumers has kept the publishing system going (Raven, 2009). The commodity aspects of books involve not just mass-market generated profits, but

issues of consumers' status and cultural distinction (Benton, 2000; Joshi, 1998), as well as circulation in local systems of para-market exchange (Zboray & Zboray, 1996, 2006).

The rise of the reader in HOB reoriented the approach shortly after it was launched. No wonder: to justify its approach, HOB's first generation had relied upon largely circumstantial evidence that books were important to society and culture. Harder evidence would be required, and that would come better in the form of thickly descriptive case studies of specific individuals and smaller groups than through relative abstractions like "the public" – interpretative ideationalism (Keesing, 1974) exerted influence on HOB through anthropologist Clifford Geertz's centrality in the New Cultural History (Miller, 1997, p. 365). Quickening the move was an alliance with theories of subject-identity construction, often with feminist underpinnings, and a practice of grounded inquiry. Radway (1984), for example, interviewed book club women about their reception of romance novels that exposed a multiplicity of responses challenging producer-centricism, i.e., meaning imposed from above instead of generated below. Davidson (1986) delved into the archives to discover, even by examining readers' marginalia, the meanings of the early American novel for women and men; she subsequently edited a journal issue that led to a landmark book of essays on reading and social history (Davidson, 1989).

The move toward readers was pushed by larger currents, too. Notable was the widening impact of German reception studies in two flavors: one textual, *rezeptionsästhetik* (Iser, 1972), leading to a search for readers in the text, and the other contextual, *rezeptionsgeschichte* (Jauss, 1970), as instantiated in readers' "horizon of expectations" (set by similar works previously encountered) when engaging a text (pp. 12–14). It was but a short step from theories of readers' meaning-making from texts, to research addressing how books impacted readers. Rarely acknowledged support for this step came from audience research in media studies (Allington & Swan, 2009) that underscored "audience sovereignty" (Butsch, 2000, pp. 3–12) and the "active audience" (Fiske, 1987, pp. 223–224). This meshed well with HOB's performance practice of interpretative freedom. Darnton (1982b, pp. 78–79) at one point even argued that reading might always remain an unsolvable mystery, perhaps to shore up the producer-centric early HOB.

A generation of scholarship that attempted to demystify reading soon came to the fore. Patterns in library charge records were discerned to link "readers" and genres (Pawley, 2001; Zboray, 1993, pp. 156–179) or specific authors (Todd, 1999). Some scholars connected specific authors with readers through archives of fan letters (Blair, 2008; Williams, 1990); others shifted to the text, using readers' letters responding to specific items, like pulp magazine stories about unwed women's pregnancy (Kunzel, 1995). Rose (2001) deployed working-class British autobiographies to argue the pervasive influence of mainstream canonical authors, rather than class-situated ones, upon laborers; E. Smith (2000) reconstructed working-class readers from advertisements targeting them; and Nord (1988) availed himself of subscription lists containing artisans' names. Records of book clubs and other reading groups have proved

particularly rich, especially for recovering African American readerships (McHenry, 2002). Readers' diaries and letters provide the most complete contextualizations of not only a universe of reading but how it plays into everyday life. Research began at the individual or family level (e.g., Colclough, 2000; Sharpe, 2000; Zboray & Zboray, 1997c), but has been moving toward encompassing larger groups, such as seminary-schooled early American women (Kelley, 2006) and partisan-minded ones of an overlapping later period (Zboray & Zboray, 2010). To date, the most extensive study has ethnographically surveyed reading practices of 931 informants leaving testimony in nearly 4,000 diaries and letters from a single region over three decades (Zboray & Zboray, 2006). Even larger-scale collective projects are afoot to pool together data, but these still await suitable analytical procedures for making sense of the resulting vast data fields (Halsey, 2008). After all, readers' diaries and letters are themselves texts that require perhaps even greater contextualization than the printed texts produced by the publishing industry, to which those readers refer.

The Future HOB

HOB's pursuit of what books have meant culturally in different societies over time has advanced immeasurably since 1980, thanks to the turn to the reader, which has pioneered essential methods for exploring that meaning. Much spadework remains to be done for varying times and places, especially beyond Britain, France, and the United States, before firm generalizations can be developed or cross-cultural comparisons can take place. Transnational work is already underway on modern technical and scientific translations (Rupke, 2000), and, particularly through them, the problematic of bridging the highly divergent, virtually incommensurable, and equally ancient book cultures in Europe and China (Fu, 2011). Although HOB nationalism will eventually need to be overcome beyond these rare analyses of translations, the language-based nature of reading and reception studies makes this unlikely in the short run, except perhaps in the former empires of Spain and Great Britain, whose colonies shared a common tongue of governance. Even within each national HOB, a fuller integration of the reading-based research accomplished so far into production and distribution awaits (for an early attempt, see St. Clair, 2005). For example, one can compare how publishers and authors perceived their market with how the consumer/reader self-reports received their printed products. Whether political economy will play a role in the future HOB is an open question: certainly, with reader/consumer testimony at hand, a re-evaluation of the book as hegemonic is in order to see how large-scale power structures express themselves in seemingly benign consumer choice and self-culture. Investigating those expressions on the physical page (Barnhurst & Nerone, 2001), and plumbing readers' reception of them, promises to align the often antagonistic bibliographical and cultural history traditions in HOB. Finally, HOB will need to explore further the impact on readers of explicit

regulation by governments and tacit shaping of print culture by its industries to effect social silencing and agenda setting.

So, as a culturally interpretative approach, HOB should add greater analysis and deeper criticism to its practice of scholarly performance and contextual description. Ironically, the very success of HOB in raising bibliographical awareness across disciplines has led some non-specialists to do just this (e.g., Feener, 2007, pp. 269–271; Hoeflich, 1997; Hofmeyr, 2004): to make these scholars rethink the highly mediated nature of print and scribal evidence they too often take for granted. Rather, these scholars have learned from HOB that such evidence results from specific systems of production, distribution, and consumption that together may affect that evidence's sociocultural meaning. Ultimately, then, HOB's greatest contribution may turn out to be a broadly shared, new "print-culture imaginary" in the minds of media historians and other scholars and students.

NOTES

- 1 Nerone (2006) points to the history of the book as one of three "interdisciplinary scholarly formations" (p. 254) that promised to bridge communication history's heretofore divided mind between the cosmically interpretive (e.g., the New York and Toronto schools) and the concretely descriptive (e.g., histories and biographies emerging from journalism schools). See also Nerone (2003). Zboray and Zboray (2011) provide quantitative substantiation of communication studies' disregard of the history of the book.
- 2 Media scholars familiar with the Weaver–Shannon (1963) model of communication will recognize the similarity to book historian Robert Darnton's "Communication Circuit" (1982b, p. 68). Even in the narrow economic sense, the relationship between production, distribution, and consumption is murky, as Marx (1973, pp. 83–100) points out.
- 3 Recognizing the overlap, Zboray and Zboray (2006) apply the triadic scheme ethnographically to a specific group of "real" readers or consumers, putting production and dissemination in their hands as much as reception. For an early discussion of the "real reader" concept in English, see Schmidt (1979, pp. 160–161; cf. Radway, 1984; Zboray & Zboray, 1997b).
- 4 To encompass scribal production, Adams and Barker (1993) advocate denominating the object of study as the "bibliographical document." An alternative label is "material text" (Moylan & Stiles, 1996), but this hazards occluding non-textually based meanings and practices. "Print culture" is, of course, yet another alternative that was early on jocularly derided by HOB-founder Hugh Amory's (1984) reference to his contemporary "xerox culture" (p. 345): "'print culture' is what men and women thought of printing or did with printing, and it has no clear relation to" bibliography and, by extension, the history of the book.
- 5 On cognition and HOB, see Enenkel and Neuber (2005); and on the related book-inspired imaginary, Piper (2009).
- 6 The web page of the Society for the History of Authorship, Reading, and Publishing (2010), the main international HOB association, captures this expansiveness: "Research addresses the composition, mediation, reception, survival, and transformation of written

- communication in material forms including marks on stone, script on parchment, printed books and periodicals, and new media.” Tanselle (1971) advances the term “imprint” (pp. xii–xvi), which can account for non-book materials, but not scribal ones.
- 7 HOB has been moving from an exclusive focus on the paper page toward encompassing electronic communication, like web pages, that employ traditional bibliographical formats and typography (Erickson, 2003; Hillesund, 2007).
 - 8 See White’s (1975, pp. 52–55) historiographical gloss on Roman Jakobson’s thoughts regarding linguistics and poetics. On materialism versus ideationalism, see Tang (2011, pp. 217–220). “Cultural poetics” is the preferred phrase of Greenblatt (1988, p. 5) over the more widespread “New Historicism” associated with him. “Conservative” here refers to the nineteenth-century origins of the history of ideas in Hegelian idealism (D. Kelley, 1990).
 - 9 Darnton (1999; 1990, pp. 254–256) addressed his distinctions from Marxist history, and the history of ideas (Darnton, 1971).
 - 10 We were invited to contribute to volumes 2 and 3 (we declined), and one of us participated in a planning meeting for the project.
 - 11 The Library of Congress’s Center for the Book antedated the AAS’s program by six years (Shevlin & Lindquist, 2010). Librarian of Congress Daniel Boorstin (1978) explicitly linked its founding to the history of ideas and their future: “The Book is the reservoir of the ideas we have forgotten, and will be the reservoir for all ideas still unborn” (p. 182).
 - 12 The quantitative element in the New Social History has been exaggerated, testifying to the success of its opponents’ charges of positivism and unreadability. Many new social historians either did not use quantification (e.g., especially those who tried to recapture voices of African Americans and White women, like Blassingame, 1972; or Cott, 1977), or did as part of a broader methodological arsenal that included qualitative approaches (Dublin, 1979; Gutman, 1977).
 - 13 A corresponding event took place for Europeanists in 1980 (Miller, 1997, p. 362).
 - 14 Hench (1994) quickly dispatches Mott with a brief quote cribbed from the AAS’s NEH grant proposal of building on his work for a “history of literary cultures” (p. 12).

The Enlightenment and the Bourgeois Public Sphere (Through the Eyes of a London Merchant-Writer)

Juraj Kittler

ABSTRACT

Conventional histories of the twentieth century had a propensity to idealize the seminal role played by the Enlightenment in ushering in modernity. Their impact on communication scholarship was reflected in Habermas's seminal work, which equated the main achievements of the English Enlightenment and the rise of the public sphere, defined as a venue fostering public opinion by means of rational debate. Yet, the same eighteenth-century London coffeehouses that were idealized by Habermas as prototypes of democratic civic institutions are described by historical sources also as places of scandal and depravity, infested with deception and the manipulation of information. Daniel Defoe – merchant, journalist, and author of countless political pamphlets and literary novels – is one such exclusively positioned observer whose writings and personal life fully expose the ubiquitous dialectic tension between forces emphasizing the democratic potential of the emerging public sphere in London, and relentless efforts for its commodification. Indeed, Defoe's testimony challenges the very notion of its bourgeois nature. In conclusion, this essay attempts to demonstrate that the key concepts of the public sphere such as public opinion, consensus, and deliberative process predate the Enlightenment era. They had already been discussed in Renaissance Venice, albeit within a strikingly opposite normative framework. As a normative ideal, they became definitely adopted by mainstream society in mid-seventeenth-century England.

In his famous 1784 answer to the question *What is Enlightenment?*, Immanuel Kant (1959) described it as “the freedom to make public use of one’s reason at every point” (p. 87). Yet, added the philosopher, if someone had to ask him whether the Western world was already living in an “enlightened age,” his answer would have been a categorical “no” (p. 90). Kant understood the Enlightenment as a historical process through which humankind can prove to itself that it is capable of creating a society demystified, stripped of all irrationality, relying on the sole power of its own reason (p. 85).

About a century-and-a-half later two other German philosophers assessed the heritage of the Enlightenment era. Adorno and Horkheimer in their 1947 *Dialectic of the Enlightenment* came to the disquieting conclusion that the entire Enlightenment project was at the very best a missed opportunity, at the worst it resulted in a *disaster triumphant*, a new type of barbarism. They claimed that the Kantian *sapere aude* – the audacity of knowing – backfired on humanity which, instead of achieving liberation through knowledge, had now to bear the even more powerful yoke of self-imposed tyranny in the form of rationalism void of morality (Horkheimer & Adorno, 1972, pp. xi, 3).

It was paradoxically Adorno and Horkheimer’s own apprentice, Jürgen Habermas (1989), who, in the early 1960s, attempted to rehabilitate the centerpiece of the entire idea of Western modernity – the Enlightenment project. Habermas’s thesis *The Structural Transformation of the Public Sphere* stood out “for its unflinching defense of enlightenment rationality” and was widely received as a critical response to *Dialectic of Enlightenment*, especially in regards to the political pessimism permeating Adorno’s writings in the postwar period (Honneth, McCarthy, Offe, & Wellmer, 1992, p. ix; Hohendahl, 1992, p. 99). While most of those who studied the Enlightenment before him focused on the revolution of ideas and lofty philosophical disputations which it produced, Habermas was able to construct a tangible sociohistorical argument directly addressing the communicative practices which were at the core of Western democracy and in one great stroke of genius explained its past, present, and potentially even the future (Kors & Korshin, 1987, p. 2). It would be a futile attempt to reconstruct the entire dynamics of the academic debate which erupted chiefly after Habermas’s thesis was translated and published in English in 1989. At first it inspired mainly Habermas’s supporters, but as time went by and some of the pillars on which the original thesis stood started to shake under the pressure of revisionist scholarship, it rallied mainly the camp of the opponents. The author himself finally admitted that his original design of a *grand theory* of the public sphere was beyond salvation (Habermas, 1992, p. 421).

Yet Habermas’s idea was paradoxically one of those rare contributions to social knowledge which, thanks to the relentless efforts of its critics, continues to drive an enormous amount of new research. With the hindsight of almost half a century one may say that the ultimate historical importance of his contribution to social analysis dwells in the creation of a new ontological category of the *public sphere*. The author defined it very vaguely as something which “comes to being in every conversation

in which private individuals assemble to form a public body.” Its ultimate goal is to produce *public opinion*, which Habermas described as “the task of criticism and control which a public body of citizens,” leaving behind their private interests, “practices *vis-à-vis* the ruling structure organized in the form of the state” (Habermas, 1980, p. 198). In formulating the category of the public sphere, Habermas met the terms of the methodological imperative formulated by Marx (1973, p. 100) that any kind of social inquiry should start from the *simplest determinations* – general and abstract relations, or the smallest common denominators, characteristic of the systems of complex social structures and relations. His broadly delineated public sphere is, from the outset, ingenious in the way that it spills across the boundaries of artificially created disciplinary divisions within the social sciences, arts, and humanities. It brings together scholars investigating practically any aspect of social life, and as such it may be a perfect answer to Braudel’s (1980, p. 25) quest for a complex and contextualized social history. At the same time, the notion of *structural transformation*, which the author used in the title, implies the need to see social change through the prism of an ever-evolving process. Or even better, as a set of mutually constitutive abstract processes – mainly those which are traditionally attributed to the advent of modernity such as individuation, commodification, rationalization, spatiation, abstraction, or alienation – all acting upon one another in various stages of formation, resulting in unpredictable mutual synergies (Mosco, 1996, p. 8; Ogborn, 1998, pp. 20–21; Ollman, 2003, pp. 13–14). Such processes imply deep structural changes which are slow by definition. To capture them the scholar needs to step back in order to get the feeling of what Braudel (1980, pp. 27–31) saw as the dynamics of the *longue durée*.

Paying due tribute to Habermas, it is time to point out that the ultimate flaw of his thesis was in his epistemological approach. Its whole argument was not guided by empirical findings relying strictly on primary sources. Instead, it was driven by an *ex ante* formulated hypothesis supported by secondary academic literature (Downie, 2003, p. 2; Zaret, 2000, pp. 4–5). Carried astray by this methodological handicap, his study discovered what it was aimed at discovering from the outset: it echoed the (at the time) dominant paradigm with its strong emphasis on the central role of the eighteenth-century Enlightenment period in ushering in modernity (Calhoun, 1992, p. 4; Friedman, 1981, p. 111). The central role of the bourgeoisie in this process may have paradoxically reflected Horkheimer and Adorno’s (1972) own nostalgia for “the great bourgeois art” which, as they claimed, “as a separate sphere was always possible only in the bourgeois society” (pp. 126, 156).

Why the Focus on London?

Habermas selected Great Britain as a “model case” for his study. London coffee-houses serve as the backdrop for private individuals who assemble in the public body

which almost immediately laid claim on the early periodical press, only recently freed of censorship (Habermas, 1989, pp. 57–61). Yet in answering the question “How useful to the eighteenth-century English studies is the paradigm of the ‘bourgeois public sphere’?”, Downie (2003) comes to a conclusion which is rather dismissive of the entire Habermasian model. He argues that the author twisted important historical developments to support his thesis. The very notion of the public sphere which was *bourgeois* in its nature is completely misplaced because English society continued to be dominated by the aristocracy up until the late 1700s (Downie, 2003, p. 1). But eighteenth-century London, as a key to our understanding of the advent of modernity, continues to be the research focus of even those who took harsh revisionist positions against the original Habermasian thesis (Zaret, 2000, pp. 6–7; cf. Downie, 2003; Melton, 2001; Ogborn, 1998).

In the ensuing paragraphs, I would like to make my own justification for the study of the public sphere in eighteenth-century London. Consequently, I would like to offer the reader an opportunity to peek into Habermasian coffeehouses and observe the dynamics of London social life, mainly through the writings of Daniel Defoe. I further argue that to interpret the empirical material collected in London, one needs to see English society from a holistic perspective – not just in the sense of looking inwards at different alternative publics and counterpublics as many of Habermas’s critics do, but even more importantly in the context of the social experiences of other important commercial and political centers of the Western world (Zaret, 2000, p. 11).

It was Braudel (1982–1984, vol. 3, pp. 27–34), in his monumental study of Western civilization and capitalism, who devised the classic sequence of dominant cities – i.e., Bruges, Venice, Antwerp, Genoa, Amsterdam, London, and beyond. We can reasonably assert that such places held, for a limited period and in mutual succession, a hegemonic power-grip over the entire supranational Western civilization and as such “refer to the system as a whole at different stages of its development” (Arrighi, 1994, p. xi). If we follow this advice we may discover that the key subcategory of the public sphere – public opinion – was as a concept already discussed in Renaissance Italy – mainly at the level of reflexive practice, but implicitly also as a philosophical category. Yet, as Pirenne (1909, 1915, 1956) suggested, the real roots of Western democracy must be searched for in the experience of the High Medieval period with its rediscovery of Aristotelian rational argumentation and dialectic, its merchant urban communities with their bodies of civic government and independent judiciary systems. These were, according to Pirenne, the real training grounds of modern democracies.

The era of London’s hegemony over Western thought roughly corresponds with what historians labeled the *long eighteenth century*, a term which is often used interchangeably with the English Enlightenment (Clark, 2000, p. x; Porter, 2000, p. xvii). It was the period in which English society enjoyed an indisputable economic, political, cultural, and military supremacy in the West. Merchants, artists, and philosophers were coming to London to study the peculiarities of the English system in order to discover the secrets of its success, trying to “borrow” some of the know-how and implement it at home (Voltaire, 1947, p. 54). In 1711, Joseph Addison confessed in a

London coffeehouse newsletter that there was no place in the town which he so much loved to frequent as the Royal Exchange. "It gives me a secret satisfaction, and in some measure, gratifies my vanity, as I am an Englishman, to see so rich an assembly of countrymen and foreigners consulting together upon the private business of mankind, and making this metropolis a kind of Emporium for the whole earth" (Addison & Steele, 1852, p. 82).

Daniel Defoe, London Merchant and Writer

Daniel Defoe (ca. 1659–1731) was one of the key protagonists of London's public life whose lifespan corresponds with the early period of the English Enlightenment. Defoe was a poster child of Marx's man who "makes his own history, but he does not make it out of the whole cloth" (2007, p. 13). His complex personality is riddled with internal contradictions. His all but straightforward life-journey makes him an almost perfect metaphor for the ambiguity and confusion on whose wave modernity rode. And his humble pedigree can help us to shed more light on those who became the protagonists of the Habermasian bourgeois public sphere (Downie, 2003, pp. 11–12).

Born as Daniel Foe in a poor neighborhood outside of London's Cripplegate, the aspiring merchant, failed brick manufacturer, and later in life a famous writer and secret government spy gradually changed his name first to the more reverent De Foe and finally to Defoe (Defoe, 1955, p. 17; cf. Bastian, 1981). As a merchant and early industrialist, Defoe was a failure, yet he was very proud of the role that tradesmen, this nascent class of urban aristocracy, played in English society. "This being the case in England, and our trade being so vastly great, it is no wonder that the tradesmen in England fill the lists of our nobility and gentry," he claimed. And the comparison to aristocracy was not just a metaphor. Defoe observed the prosperous English tradesmen "coming every day to the herald's office, to search for the coats-of-arms of their ancestors, in order to paint them upon their coaches, and engrave them upon their plate, embroider them upon their furniture, or carve them upon the pediments of their new houses." Contrary to the customs prevailing at that time in most of the other European feudal countries where the traditional landed aristocracy did not mingle with the merchant class, in England "the gentlemen of the best families marry tradesmen's daughters, and put their younger sons as apprentices to tradesmen" (Defoe, 1726, vol. 1, pp. 310–311; cf. De Saussure, 1995, p. 133). Just as the new ruling classes in post-communist Europe are a blend of old apparatchiks, former secret spies, and some new blood which was ready to seize the window of opportunity to slip among the elites, the emerging London bourgeoisie was from the beginning an amalgamation of the old aristocratic establishment and new social elements. "Marchauntes, they becoime lordes and lordes bleth, marchaundyte," an anonymous London poet observed already in 1550 (Anonymous, 1550, p. 4).

The Habermasian Utopia

The periodical press in England started booming shortly after the Licensing Act lapsed in 1695 and was not renewed. "We had no such thing as printed newspapers in those days, to spread rumors and reports of things," wrote Defoe in the opening paragraphs of his memoirs of the plague year of 1665. "But such things as those were gathered from the letters of merchants and others who corresponded abroad, and from them were handed about by word of mouth only" (Defoe, 1722, pp. 1–2). A typical Englishman, regardless of class, was known for an insatiable appetite for news. According to Ward (1703), he was "a great news monger, and all public reports must occur to his knowledge, for his business lies most in coffee houses, and the greatest of his diversion is in reading the newspapers" (p. 186). Consequently, a typical coffeehouse boasted foreign and domestic journals covering a wide array of international issues important to merchants, but also "papers of morality and party disputes" (Macky, 1714, p. 109). Even groups of poor London shoeblacks would be customarily seen to purchase a farthing paper together and one or two of them who were literate would read the news out loud to their fellows gathered around the table in a coffeehouse (De Saussure, 1995, p. 101). Defoe's own journal, *A Weekly Review of the Affairs of France*, was reportedly read by many cobblers and porters (Downie, 1979, p. 6). The author himself claimed that "you will find very few coffee-houses in this opulent City, without an illiterate mechanic, commenting upon the most material occurrences, and judging the actions of the greatest councils of Europe" (Defoe, 1951, p. 17). An amused Swiss visitor to London conferred that he could indeed often see an Englishman "taking a treaty of peace more to heart than he does his own affairs" (De Saussure, 1995, p. 101).

In 1711 two of the most prominent early British journalists, Addison and Steele, founded *The Spectator*, a special coffeehouse journal whose mission was to imitate Socrates who "brought philosophy down from heaven, to inhabit among men." Addison claimed that similarly their ambition was to bring philosophy "out of closets and libraries, schools and colleges, to dwell in clubs and assemblies, at tea-tables, and in coffee-houses" (Addison & Steele, 1852, p. 15). Steele in one of his editorials explained in detail the daily rhythm of the coffeehouse with its changing clientele. From six in the morning when the men "who rise early for no other purpose but to publish their laziness" started to read their newspapers and discuss politics, through quarter of eight at which time they were interrupted by the students of law dressed for Westminster, then the first well-to-do customers appeared "in their night-gowns to saunter away their time." When the day drew on, they gave place to men of business. Their entertainments, emphasized the author, are "derived rather from reason than imagination." A typical coffeehouse was open till midnight and as such became "the place of rendezvous to all that live near it." Steele concluded that, London coffeehouses became "little communities which we express by the word neighborhood" (pp. 58–59).

The earliest known coffeehouses were licensed in London in the 1650s and in 1714 Macky counted “by modest computation” about 8,000 of them (p. 30). This was surely an inflated number but it reflected their ubiquity in the city’s urban texture (Ellis, 2004; Hatton, 1708, p. 30). Foreigners often noted that it was the peculiar institution of a coffeehouse which made London so different from any other European city. Those who wished to find a gentleman commonly asked not whether he lived in Fleet Street or Chancery Lane, but whether he frequented the Grecian or the Rainbow (Macaulay, 2006, p. 361).

The Less Utopian Reality of the London Coffeehouse

From the empirical evidence gathered above the reader may indeed get an idea that there once was an ideal universe of London coffeehouses in which everybody had access to public debates centered around rational arguments, where nothing was immune to criticism and every participant had free access to information unadulterated either by political or by commercial interest. Yet there is a much less flattering image of this world captured in the writings of Defoe. “The tea-table among the ladies, and the coffee-house among the men, seem to be places of new invention for a depravation of our manners and morals, places devoted to scandal,” cautioned the writer (Defoe, 1726, vol. 1, p. 188). What made Defoe so hostile toward an institution which Habermas saw as one of the catalysts of modern democracy? Well, even during their “golden age” between 1680 and 1730 (Habermas, 1989, pp. 32), coffeehouses were not utopian islands but *genuine* social worlds susceptible to all human propensities and pitfalls. Those who met in their precincts were *real* people who were not able to leave behind their private interests when participating in public debate. And finally those who mediated such discussion through early London newspapers customarily had their own fish to fry. Overall, London coffeehouses and their newspapers were everything but the ideal image painted by Habermas in his seminal opus. Yet to understand Defoe’s scorn, we need to first know more about the author himself.

Shortly after his marriage in 1684, Defoe opened a small trading business next to Lythe’s coffeehouse in Freeman’s Yard adjacent to the Royal Exchange. His own experience transpired later in the portrait of an ideal merchant who could have sat as a model to Max Weber for *The Protestant Ethic* (1958). Defoe’s merchant was a global citizen, who, sitting in his counting house, could have at once conversed with the whole world through business correspondence and private intelligence letters. “This and travel make a true-bred merchant the most intelligent man in the world, and consequently the most capable, when urged by necessity, to contrive new ways to live” (Defoe, 1702, pp. 7–8). The universe of Defoe’s merchants revolved around their counting houses, the Royal Exchange, and company halls, all places which offer “suitable occasions to discourse

with their fellow tradesmen, meeting them in the way of their business, and improving their spare hours together" (Defoe, 1727, vol. 1, p. 45).

Yet Defoe, the old-world commodity trader, saw a new form of trade arise right in front of his eyes based on the exchange of abstract values, and with it also a new type of merchant. "The face of trade has its new turns in the heads of the people to such a degree, that it is worth our reflection," argued the author (Defoe, 1727, vol. 2, part 2, p. 161). The late seventeenth-century commercial boom in London gave birth to what he called *projects* – intricate financial schemes involving any kind of commercial activity from international exchange schemes to technical innovations, but increasingly also wagering and lotteries. Defoe traced the origin of the "projecting humor that now reigns no farther back than the year 1680, dating its birth as a monster then." He acknowledged that many of the projects, such as London's waterworks, resulted in practical innovations which significantly improved the life of his city (Defoe, 1702, p. 24). But others, such as the famous South Sea bubble which burst in 1720, ruined many credulous people (pp. 12–13). Indeed, the South Sea folly had all the symptoms of the irrational exuberance of Greenspan's era (Ward, 1720, p. 1). Defoe (1728) argued that the entire South Sea bubble was "a scheme trully infernal, in which the Devil was as certainly the principal operator" (p. 262). At the same time, the author nostalgically recalled "the good old days of trade, which our fore-fathers plodded on in, and got estates too at, there were no bubbles, no stock-jobbing, no South-Sea infatuations, no lotteries, no funds, no antiquities, no buying of navy bills, and publick securities, no circulating Exchequer bills." Instinctively, he knew that something important in the very nature of his world was changing. And he described this change through a simple metaphor without using fancy terms like *abstraction* or *alienation*. In his youth, Defoe (1727) argued, "trade was a vast great river, and all the money in the Kingdom ran down its mighty stream; the whole wealth of the Nation kept in its channel." But with the advent of stockmarket speculations, the flow of this mighty river was artificially distorted by private interest, there are suddenly "new channels or side-drains laid open to abate its waters, to divert its current, and to carry its stream off from the ordinary course" (vol. 2, part 2, pp. 7–8).

Among such new turns of the trade was also the one which he called "by a new name, stock-jobbing." At first, it was only an occasional "transferring of interest and shares from one to another, as persons alienated their estates." But as the brokers realized that there was money to be made on speculations with stocks, they "got the business into their hands and turned it into a regular trade, managed with the greatest intrigue, artifice, and trick, that ever anything that appeared with a face of honesty" (Defoe, 1702, p. 29). In the 1690s, merchants who dealt with stocks got their first own *walk* among the other commodity traders in the Royal Exchange. Their business increased but by the end of the decade they were expelled for rowdiness and moved into the adjacent coffeehouses in Exchange Alley where "the brokers, those vermin of trade, got hold of it" (Defoe, 1702, p. 173; London Stock Exchange, 2010). This was the dark side of the metropolis's bourgeois public sphere which Habermas's thesis-driven research completely ignored. In 1719 Defoe famously noted

that “the center of the jobbing is in the kingdom of the Exchange-Alley, and its adjacencies” (p. 35), which was a cluster of 20 or so coffeehouses squeezed in narrow passages connecting the Royal Exchange with the main Post Office.

Despite his open disdain for coffeehouses, Defoe himself couldn’t avoid frequenting them either. During the time when he worked as a spy and hired pen for Robert Harley, the future lord treasurer and prime minister in all but name, Defoe was reportedly seen “frequently, but privately at a coffee-house in St. James’s.” It was one of the upscale establishments near Westminster frequented by Whig politicians where they could privately discuss their party affairs (Peterson, 1979, p. 316). He must have been a known entity also at Jones’s coffeehouse in Finch Lane near the Royal Exchange, whose personnel mediated the writer’s correspondence with Harley during his clandestine service (Defoe, 1955, p. 13).

With the ascent of the role of Parliament in the English constitutional system throughout the seventeenth century, leaders of political factions and their followers naturally gravitated to taverns and coffeehouses. Many of such semi-public spaces, open originally to everyone, were gradually turned into more-or-less private social and political clubs (Allen, 1933, p. 15). In 1711, after a failed assassination attempt on his political patron Robert Harley, Defoe (1711, pp. 82–99) anonymously published a pamphlet against the members of a secretive group of Tory radicals who met at Bell Tavern in Westminster and became known as the October Club (Downie, 1979, pp. 126, 135). Indeed, by the early 1700s London had several coffeehouses famous for attracting either Whigs or Tories where an opponent was not always welcomed. As a Whig “you may talk politics at the Smyrna and St. James’s [. . .] but a Whig will no more go to the Cocoa Tree or Ofinda’s, than a Tory will be seen at the coffee house of St. James’s,” advised his reader John Macky (1714, p. 108).

London coffeehouses were significantly polarized especially in the aftermath of the Triennial Act of 1694 that turned English politics practically into a state of permanent electioneering (Downie, 1979, p. 1). Many propagandistic tricks, perfected previously by stock-jobbers, were suddenly adopted also by those who ran for political offices. Defoe strongly denounced the fixing of elections and the selling and buying of votes in Parliament as “a new trade of parliament-jobbing” and linked it directly to powerful financial interest groups and stock-jobbing combinations. “Thus let them job, trick, and cheat one another,” warned the author, “but for God’s sake, gentleman, do not let the important affairs of the state come under their wicked clutches” (Defoe, 1701b, p. 22). Because, he added elsewhere, “when statesmen turn jobbers, the state may be jobbed” (Defoe, 1719, p. 42).

What “Bourgeois” Public Sphere?

Indications that Defoe himself was early-on involved in some schemes and speculations may further illustrate his complex character (Bastian, 1981, pp. 187–189). It

could have been an initial failure or his strict Protestant upbringing which discouraged him to pursue this form of business further. This is perhaps unsurprising, as the new group of traders was certainly a very bizarre stock. Addison portrayed a typical projector as someone who could be easily recognized by “shabbiness of his dress, the extravagance of his conceptions, and the hurry of his speech” (Addison & Steele, 1852, p. 70). Macky (1714) compared stock-jobbers at Jonathan’s to the “set of sharp faces” he previously experienced at Little Mann’s coffeehouse, a notorious gathering place of petty criminals and gamblers (pp. 108–113).

This new group of aspiring “bourgeoisie” consisted usually of men of little means with a sense for adventure, who saw in this murky business a unique opportunity to escape their social predicament. A typical stock-jobber was “led on by the mighty hopes of advancing himself to a coach and horses, that he may lord it over his neighboring mechanics” (Ward, 1703, p. 391). Many were Jewish refugees escaping the Spanish Inquisition. They were generally tolerated in London, but their rights were curtailed and they were always suspect, if not openly hated by many Londoners. Exchange-Alley in Defoe’s writings “throungs [*sic*] with Jews, jobbers and brokers, their names are needless, their characters dirty as their employments” (Defoe, 1719, p. 41). Yet from the hundreds who tried to walk the path of the stock brokerage, only a few lucky ones were able to advance themselves materially and socially. Those who made it became part of the emerging group of British bourgeoisie, the *nouveaux riches* of the Enlightenment era.

Habermas has been justly criticized for the fact that his idealized public sphere in London coffeehouses did not include other social categories such as class and gender in the overall analysis (Fraser, 1992). The author himself admits the parallel existence of – for example – a *plebeian public sphere*, yet he claims that even such alternative publics remained “oriented toward the intentions of the bourgeois public sphere” which, from the very beginning, enjoyed almost absolute social and cultural hegemony (Habermas, 1989, p. xviii). While the images of petty gamblers trying to imitate the life of those who were well off, or the workers immersed in passionate coffeehouse discussion while taking the problems of royalty closer to their hearts than their own, may partially justify such a claim, the social body of the English metropolis undeniably contained alternative publics and counterpublics whose goals and identities were clearly differentiated from the aspiration of the nascent bourgeoisie.

Defoe gives us a glimpse into the world of one of these alternative publics in his pamphlet *Every-body’s business, is no-body’s business* (1725), in which he strongly condemned the strike of London women-servants. “Thus have these wenches, by their continual plotting and cabals, united themselves into a formidable body, and got the whip-hand of their betters; they make their own terms with us,” wrote the outraged author, revealing his own social bias. From his words it is clear that the maids were organized and quite conscious of their social position. Furthermore, as women, they became the driving force of social protest in London. “They set an ill example to our children, our apprentices, our covenant-servants, and other dependents,” lamented

Defoe. "The great height to which women servants have brought their wages, makes a mutiny among man-servants, and puts them upon raising their wages too" (pp. 12–13).

The Not-So-Ideal World of the Early London Press

The spread of intrigue and false rumors around coffeehouses was among the most prominent tools the stock-jobbers used to lure their potential customers into fatal investments. In *The Anatomy of Exchange-Alley*, published just a year before the South Sea Company bubble crashed in 1720, Defoe (1719, p. 4) explained the exact mechanism by which the combinations of stock-jobbers manipulated the markets through false information. Originally, they relied only on word of mouth. But with the proliferation of the uncensored press in the early 1700s, stock-jobbers quickly figured out that the "free press" was their important ally. As Defoe (1719, p. 9) explained, "the putting false news upon us" became business as usual among the skillful managers of the university of Exchange-Alley who now worked with a combination of sham reports disseminated by word of mouth, false news planted in the newspapers, and phony letters of intelligence. The press gave such speculators the unique power "to spread rumors and reports of things, and to improve them by the invention of men" (Defoe, 1722, pp. 1–2).

In the early 1700s some of the most powerful coffeehouse brokers were able to build entire international networks of informers which were sometimes superior to the diplomatic service of the states. They became sources of the incessant flow of intelligence from Holland, Flanders, Germany, and Ireland, which gave their patrons the power to know results of "battles fought, victories won, towns taken, etc. before the swiftest expresses of the king's own servants and generals, could arrive." England was in permanent conflict with France about the Protestant succession and entire fortunes of stocks in Exchange Alley depended on the results of such events. Any broker was well versed in how to "run down true news as if it had been false, and run up false news as if it had been true by the force of his foreign intelligencers." To illustrate his point, Defoe (1719) analyzed several examples of "exquisite frauds" which were "executed in such manner as to cheat not the town only, but all Europe" (pp. 10, 16). Consequently, the author complained that manipulation of the news practiced by stock-jobbers left "so little regard to intrinsic value, or the circumstances of the company, that when the company has a loss, stock shall rise; when a great sale, or rich ship arrived, it shall fall" (Defoe, 1719, p. 53). But in the meantime, the price of stocks became a universal "rule by which we are to guide our judgment in public affairs." Thus the destiny of the entire kingdom was in the hands of a few hundred speculators, which led Defoe (1719) to conclude that the coffeehouse clientele in Exchange Alley became "as dangerous to the public safety, as a magazine of gun powder is to a populous city" (pp. 57–59).

Planting false news in London newspapers did not require too much money or ingenuity. Each London paper had one or two “investigative journalists” on its payroll, whose role was “to haunt coffee-houses, and thrust themselves into companies where they are not known; or plant themselves at a convenient distance, to overhear what is said in order to pick up the matter for the papers.” Some of such hack writers could have been bought, others were tricked. An outraged coffeehouse patron claimed that such “sons of Mercury” took down discriminately all the gossip they overheard in public places and consequently “the greatest falsehoods and the idlest fictions are often published for matters of fact” (Anonymous, 1728, pp. 5–7).

London’s Grub Street near Moorfields was the place where writers of this stripe traditionally lived and worked, and as such, the place became the earliest metaphor for British journalism. The men from Grub Street were stereotyped in literature as feckless drunkards who were scribbling furiously in their garrets by rush-light to earn enough money for a bottle of gin or to bail their belongings out of the pawnshops (Clarke, 2004, p. 6). In 1698, Ward compared the life of a typical hack writer to a strumpet: “And if the reason be required, why we betake ourselves to so scandalous a profession as whoring or pamphleteering, the same answer will serve us both, viz. that the unhappy circumstances of narrow fortune, hath forced us to do that for our subsistence, which we are much ashamed of” (Ward, 1698, p. 3). Browne’s literary character, a news-writer named Harlem, admitted that “I do not mean that I never reported in my paper anything that was false, but that I never confirmed anything to be true, that I knew in reality to be a lie.” Harlem’s character proudly boasted that despite the dubious reputation of Grub Street, “news is a great advantage to trade; an improvement of means of knowledge; a diversion to the publick; and the most vendible commodity in the whole kingdom” (Browne, 1715, pp. 230).

But the practices of deception were not limited to cheap hack writers from Grub Street. As a hired pen in the service of Robert Harley, Defoe himself arduously promoted the English union with Scotland through articles planted in the London and Edinburgh newspapers (Downie, 1979; Graves, 1934; McKim, 2006). It was an errand “far from being unfit for a sovereign to direct, or an honest man to perform,” as Defoe later defended his role. According to Downie, it was Robert Harley who for the first time proved that government can survive even under the conditions of the free press. Instead of overtly censoring or fighting the newspapers, Harley used prominent writers like Daniel Defoe and Jonathan Swift (1704) to create the first viable government public relations machinery in the modern sense of the term (Downie, 1979, pp. 2–3). Inspired by Milton’s *Areopagitica* (1644), Defoe (1951) himself pragmatically argued that while “getting money is the chief business of the world,” so the writers and printers “should be permitted the liberty of writing and printing of either side for bread, free from ignominy” (pp. 4, 21). Yet it was the same Defoe who just a few years earlier openly protested against the fact that London newspapers were full of fabricated stories attributed to dubious sources, an episode that only underscored his conflicted personality (Defoe, 1701a, p. 3).

For an author or publisher of Defoe’s reputation, it was not easy to survive in early modern London without compromising what we would call today professional

integrity. A publisher “having found a declension in the sale of his newspaper” was often forced to fabricate scandals in order to make sure that his paper would sell sufficiently “to make us amends for our trouble” (Anonymous, 1735, pp. 25–27). From the beginning, London newspapers relied heavily on advertisements. They were filled with amusing announcements of ladies who “offer five guineas reward for a little lost dog worth five pence,” or messages of angry husbands warning merchants not to extend credit to their wives (De Saussure, 1995, p. 102). The alternative was to ally the newspaper with a strong political or business interest which would assure its financial viability. This was clearly the case of Defoe’s own *Review*, which almost fully depended on financial support through Harley (Downie, 1979, p. 12).

The experience of Defoe’s London clearly indicates that political spin and manipulation of public opinion through canned stories intentionally “leaked” or directly planted in the media was far from a twentieth-century invention. The English dictionary published in 1735 by Defoe’s son Benjamin Norton noted that one of the meanings of the term *spin out* is also “to make the most of a thing,” though it is not sure whether the term was used also in the context of political manipulation. A 1717 anonymous London pamphlet already challenged the concept of public opinion that by this time became a yardstick by which important social and political forces measured the legitimacy of their actions. Its author claimed that a mere opinion, private or public, doesn’t have the power to change reality and produce truth. “The truth will be truth, whatever the opinions of men concerning it may be,” argued the writer. Quite the contrary, the pamphlet concluded, “perhaps what becomes the public opinion, is often owing, only to the power, ambitions and subtle management of the one single man. Or what if it be two or three craft-makers, who knew how to get their own opinions stamp’d with the public seal?” (Anonymous, 1717, p. 8).

Public Opinion and the Policies of Renaissance Venice

It is obvious that Habermas’s grand theory of the rise of the public sphere during the Enlightenment era cannot hold ground against the pressure of empirical evidence. Indeed, in order to expose what Lippmann (1927) called the “phantom public” we may need to go back to Plato and his quest for a face-to-face society in which “people may fraternize with one another [. . .] and gain knowledge and intimacy.” For Plato, only a society limited in numbers can guarantee that any form of spin and deception can be kept to a minimum simply because the players cannot “conceal their ways one from another in darkness rather than light” (*Laws*, 5.737d–e). Aristotle importantly added that this requires total exclusion of commercial interests from the public sphere. Indeed, he suggests that his ideal *polis* has two agoras, one reserved solely for public life and one for commercial activities (*Politics*, 3.1278a; 7.1331a–b).

It was first the Florentine humanists and then the Venetians who – mainly through their commercial contacts with Byzantium – gradually rediscovered Plato’s and Aristotle’s work. Such rediscovery ushered in what became the Renaissance, not only in the artistic sense but also in the rebirth of classical social and political thought. In a unique social experiment, the Republic of Venice actually implemented most of the classical republican ideals in its constitution. In his 1454 dedication of Plato’s *Laws*, George of Trebizond (1997) called the Venetian constitutional system far better than “Plato himself had ever imagined for his own republic” (p. 129). Indeed, Venice was organized around two main squares, San Marco and Rialto. In San Marco, the little section called Piazzetta or Broglio was traditionally reserved for civic functions, while the commercial activities of the city were concentrated in the Rialto (Sanudo, 1992, pp. 8–11). It was in Broglio where about 2,000–3,000 Venetian nobles, who enjoyed the status of full-fledged citizens, were encouraged to fraternize in a purely Platonic way (Foscarini, 1843, p. 301; cf. Chambers & Pullan, 1992, p. 49). Yet, when they all met once a week in the Great Council to cast their votes for important matters of state, any form of personal contact, even a congratulatory handshake after a successful vote or election, was considered suspicious (Sanudo, 1879–1903, vol. 40, pp. 664–666; cf. Finlay, 1980, p. 271). Before casting their votes, noble citizens sat quietly in long rows back to back to each other, listening to factual reports of different committee members or dispatches of their foreign ambassadors which were supposed to give them all factual information needed to adopt a responsible position on a debated issue and subsequently to cast their vote. Technical rules made sure that any potential for spin or partisan persuasion was kept to the minimum (Finlay, 1980, pp. 201, 229; de Vivo, 2007, pp. 25–26).

Empirical evidence shows very clearly that the Venetian constitutional system was far from perfect. The Broglio itself later became synonymous with corruption and electioneering (Finlay, 1980, p. 197). But if there ever was a Western society which came close to rationalizing the process of decision-making, this was it. James Harrington, who visited Venice and later strongly contrasted his model of deliberative democracy in *The Commonwealth of Oceana* (1656) with the constitutional principles of Venice, was openly puzzled by such mechanized democracy. Watching Venetian noble citizens casting their votes, Harrington noted that “it is for a dumb show the goodliest that I ever beheld with my eyes [. . .] for a council, and not a word spoken in it, is a contradiction” (p. 27). Indeed, this was the same democratic process which Jean-Jacques Rousseau observed in Venice as secretary to the French ambassador and – contrary to Harrington – later recommended in *The Social Contract* (1762). It has been described as democratic participation without public deliberation. Rousseau called it the *general will*, a rational sum of individually informed judgments. Translated into modern terms, Rousseau was talking about a society in which every voter receives only objective, factual information void of spin through communication in both personal discussion and mediated form. In other words, Rousseau was willing to sacrifice public discussion – in which participants may have an opportunity to shape their own arguments and understanding of public issues – to deprive skilled

manipulators of the opportunity to abuse the deliberative mechanism by deploying their persuasive strategies.

Reflecting on Plato's claims that orators often use their skill for personal aggrandizement (*Phaedrus*, 258a–b), and the sole purpose of rhetoric is to produce consensus devoid of any ethical standards with little regard for truth (*Gorgias*, 255a), Venetians detested public opinion, the *opinione vulgare* as they called it. Their constitutional philosophy saw personal ambition and public opinion as two things that were “very dangerous in governing the state or republic.” They saw passionate public deliberations as a crack through which partisan agendas or hidden personal interests can creep into the decision-making mechanism. After the infamous military debacle at Agnadello in 1509 that definitively derailed Venice from its path of greatness, diarist Priuli (1912–1938, vol. 4, p. 246) blamed the gradual erosion of Venetian hegemony on the irresponsible policies of populist leaders. He argued that they lost the long-term interest of the state from their sight; instead, their decisions were driven more and more by *opinione vulgare* generated through discussions in Venetian piazzas, loggias, churches, barber shops, and taverns.

Zaret's *Origins of Democratic Culture* (2000) fills the important gap between Venetian classical republican political philosophy with its negative attitudes toward public opinion, and Habermasian eighteenth-century London where public opinion is already generally recognized, even celebrated as a central feature of political legitimation. Zaret claims that this important shift took place in England before any similar comparable initiatives in other Western societies. The author locates this gradual change in the period of English Revolution (ca. 1640–1660), and derives his claim from the analysis of communicative actions of a wide group of speakers, writers, printers, petitioners, publishers, and readers. The subsequent seminal works of Milton, Locke, and Harrington further corroborate this assertion. While English history is seen by Zaret (pp. 6–7) as the “model case” for this development, such ideas subsequently spilled over to the Continent, were infused with other social and cultural norms, and resulted in similar, yet slightly different normative models of the public sphere in France and in the German lands (Darnton, 2000; Melton, 2001). But, concluding with Zaret, it was mid-seventeenth-century England that ushered in a new paradigm of communicative action based on the importance of consent, open debate, and the authority of opinion in politics that mainstream scholarship nevertheless still continues to attribute to the intellectual discoveries of the Enlightenment. Or shall we, as Robert Darnton (1971) already suggested years ago, simply redefine—eventually relocate in terms of historical periodization—the very term Enlightenment?

Journalism History: North America

Richard Kaplan

ABSTRACT

Newspapers emerged in colonial British North America in the early 1700s. By the time the first muskets were fired in the American revolt against King George III in 1775, a powerful new cultural imagining of the press's central role in the public debates of citizens and the functioning of modern democracy defined journalism. Newspapers were seen as essential to liberty, spreading information and opinion among "free-born citizens." Indeed, across three centuries this notion of the press's service to a broad deliberating public has permanently informed and justified the press's public mission, its political rhetoric, and its claims to special authority in the contentions of the democratic public sphere. From partisan journals to independent, professional dailies, from small struggling print shops to giant media conglomerates, from a few pages of cotton rag to today's electronic websites, a public ethic of service to democracy has informed the North American press's proudest moments and rationalized its worst practices.

among “free-born citizens.” Indeed, in a republic that spread across an immense physical territory, the democratic deliberations and meetings of the mass citizenry could only be virtual. The new nation was necessarily an “imagined community,” one where citizens came together only in the pages of the press.

Journalism was essential to US democracy, and this notion of the press’s service to a broad deliberating public would come to permanently inform and justify its public mission, its political rhetoric, and its claims to special authority (Kaplan, 2003; Schudson, 2002; Warner, 1990). Through all its permutations across three centuries – from partisan journals to independent, professional dailies, from small struggling print shops to giant media conglomerates, from a few pages of cotton rag to today’s electronic websites – a public ethic of service to democracy has informed the North American press’s proudest moments and rationalized its worst practices.

The first papers of British North America were modeled on the press in England, reflecting the colonies’ close cultural affiliation with the mother country. Journals copied the format and indeed their months-old news from journals transported across the ocean. They offered highly abbreviated summaries of events in England and the European continent. They were published by small artisanal print shops seeking to gain additional revenues to prop up their businesses.

Colonial newspapers shared not only their form and content with journals of the mother country but also their overarching cultural understandings of the nature of public life. Traditionally, under the British monarchy, “public” meant the presentation of the king and the nobles before the populace. In these ritual ceremonies, the overwhelming power and majesty of the king was reiterated before an observing, deferential, silent audience (Peters, 1995, pp. 7–8). The general populace supposedly lacked the reasoning capabilities, much less the authority, to participate in political decisions. Information, it was believed, should not be distributed to the citizenry or else the king’s proper rule would be disrupted. Newspapers in the early eighteenth century, thus, were understood as the official sanctioned voice of the English monarchy or colonial government and were still licensed. Journalism was often a compilation of official decrees, while the deliberations of parliament and the monarchy were by law secret. The right to publish was seen as a privilege that had to be controlled and licensed at the benevolent generosity of the royal government (Clark, 2007, p. 375).

The early efforts at journalism in Britain and the colonies were modeled on private correspondence known as “intelligences.” Dating back to the twelfth century, intelligences were handwritten newsletters addressed to elite individuals, not as citizens, but in their private capacities. The letter transmitted information on commercial, political, or diplomatic affairs that might serve their interests (Clark, 2007, p. 348). A second forerunner of the colonial press were the polemical political pamphlets that emerged out of the English Civil War and the early Restoration starting in the 1640s. These pamphlets implicitly and sometimes explicitly stressed the right of the public, or at least the aristocracy, to engage in governmental affairs and public deliberation (Clark, 1994).

The *Boston News-Letter* was the first continuously published paper, issued starting in 1704. The second, the *Boston Gazette*, began in 1719. The *News-Letter* never printed more than 300 copies of any edition and struggled to get advertisers and subscribers to pay their bills. Reflecting the monarchical conception of controlled publicity, both journals were licensed, both were officially sponsored and subsidized, and the publishers of both were brought before colonial legislatures to account for errors. This journalism made no pretense of being “free” (Modey, 2008, p. 305; Starr, 2004, p. 61).

Benjamin Franklin (1987, p. 15) details in his autobiography how his brother James, publisher of the *New England Courant*, confronted this controlled, privileged system of publicity. When he printed an article displeasing to the Massachusetts Assembly in 1723, “he was taken up censur’d and imprison’d for a month by the speaker’s warrant.” Upon release, James was banned from publishing his paper.

During 1720–1723, however, British radicals John Trenchard and Thomas Gordon, writing under the pseudonym of Cato, articulated an ideal of a free press as necessary for a free citizenry, one that possessed the right to political participation and needed information to hold the government accountable (Clark, 2007, pp. 349–350). Their 15th published letter boldly began, “Without Freedom of Thought, there can be no such Thing as Wisdom; and no such Thing as Public Liberty, without Freedom of Speech: Which is the Right of every Man, as far as by it he does not hurt and control the Right of another; and this is the only Check which it ought to suffer, the only Bounds which it ought to know.” Trenchard and Gordon advocated ideas of elite political representation in parliament and were informed by cultural traditions of republicanism. Such strands of political philosophy increasingly infused American thinking in the eighteenth century (Bailyn, 1967, pp. 35–36, 43–44; Brown, 2000, pp. 42–43).

The Cato letters were widely reprinted in British North America and cited in the 1735 trial of printer John Peter Zenger. In that court case, the governor of New York tried to suppress Zenger’s paper on the grounds of seditious libel. Zenger’s lawyer drew on the Cato letters, arguing that printing the truth could not be a libel, and that colonial Americans properly possessed “a right to liberty of both exposing and opposing arbitrary power (in these parts of the world at least) by speaking and writing truth” (Bailyn, 1967, pp. 43, 52). The Zenger case bolstered appreciation of a free press as an indispensable weapon against arbitrary rulers (Clark, 2007, p. 375).

North American exposure to Cato’s letters occurred during 1700–1750, an era in which the colonial assemblies themselves gained strength due to Britain’s “salutary neglect” (Henretta, Brody, & Ware, 1997, pp. 74, 86–87). With the 1765 Stamp Act, a new politics emerged in which conflicts in parliamentary assemblies and among local elites expanded beyond the confines of elite circles. As Richard Brown (2000, pp. 43–45) notes, “Opposition leaders in [. . .] the colonies turned to the people for support and sought to mobilize them with newspapers and pamphlets [. . .] The idea of an informed citizenry took on radical, even revolutionary, implications.”

This expanding realm and ideal of a free public and a free press reflected a peculiar constellation of power; government had only limited ability to control print addressed

to a public beyond the confines of the bureaucracy. In British North America, as well as in Britain and Europe, “fragmentation among political élites and competition in the market contributed together to breaking up the monopoly of the court gazette and opening up public political debate” (Starr, 2004, p. 59).

The new politics was also guided by the positive political ideal of republicanism. As Sean Wilentz (1997, p. 71; Nerone, 1993) details, republicanism offered a powerful vision of politics to the North American colonists in revolt against England and the king. More than a liberal philosophy of the right to pursue private individual happiness, republicanism focused on politics as a properly collective concern of citizens with the common good realized through the active participation of independent, equal virtuous citizens in reasoned public debate. A drive for new profits, or what Benedict Anderson (1983) called “print capitalism,” guided by republican political ideals without the restrictions of normal governmental repression, enabled the nascent free press and public to flourish.

As local political contentions moved into the public sphere and into print, printers elaborated a conception of press freedom. Their notion, as Stephen Botein (1975) argues, emphasized neutrality and openness to all strands of opinion. Already in 1731, that notion of printer neutrality was manifest in Franklin’s witty “Apology for Printers,” where he invoked a notion of printers serving as conduits for a broad array of opinion with which they did not necessarily agree, but which they left to the public to judge and filter. Franklin (1987) wrote:

Printers are educated in the Belief, that when Men differ in Opinion, both Sides ought equally to have the Advantage of being heard by the Publick; and that when Truth and Error have fair Play, the former is always an overmatch for the latter: Hence they cheerfully serve all contending Writers that pay them well, without regarding on which side they are of the Question in Dispute.

This posture of the press as open to a variety of opinions with very limited gatekeeping or interpretation by the journalists was challenged during the revolution and again later with the emergence of a competitive party system. American newspapers moved from what John Nerone (2007) terms a “liberal” public sphere to a “mass partisan” one. The press shifted from functioning as a neutral, open forum for a pluralistic array of political opinion to an active, one-sided political advocate. Indeed, from the passage of the Stamp Act by the British Parliament in 1765 through the founding of the new nation, the colonies were riven by an angry spirit of rebellion then revolution. Amid the contentions and often violent pressures, printers found it difficult to maintain their neutrality and thus became in Botein’s (1975) expression “reluctant partisans.”

With the revolt victorious, the new republic’s media policy was guided by a strong belief in the press’s fundamental role in democracy. Newspapers were not merely private commercial goods, but also recognized as public institutions crucial to the commonweal (John, 2000). Furthermore, communication was seen as necessary to

bind North Americans, who were culturally divided and geographically dispersed, into a united nation (Howe, 2007, pp. 222–229). In addition to a democratic desire for a vibrant press transmitted into every nook and cranny of the nation, political parties were interested in legislation to support journalism. The early US “free press” was subsidized by government through reduced postal rates and the delivery of a postal service to all small towns and hamlets across the country.

Beyond a policy of “internal improvements,” America had been transfixed since before the revolution by the potential threat of corrupt, tyrannical government to the rights of citizens. The selections on the news imposed by commercial considerations and market trends toward concentration, along with the inequalities of class economic power, were not yet visible as threats to an open, participatory public sphere of free, equal citizens. Only in the late nineteenth century with the rise of the telegraph and the Associated Press news service, and then again in the Progressive Era and the 1930s’ New Deal, would the United States reflect on the dangers that concentrated economic power posed for an independent and vigilant press.

Penny Press

Historians often describe the arrival of the “penny press” in the 1830s as a turning point in the early American press. These new cheap dailies expanded the topics considered newsworthy, embraced a new economic model for increasing revenues, and incorporated more Americans into the reading public. In many ways, this shift in the definition of the newspaper paralleled ongoing transformations of US society. In Michael Schudson’s (1978) analysis, cheap mass newspapers emerged in tandem with a new “democratic market society,” that is, a novel egalitarian urban society, detached from political battles over the commonweal, pushed by a booming market economy and very much interested in narratives of violation of social norms along with “human interest” stories.

There is much to dispute in Schudson’s classic account. The penny press, however, did reflect three revolutions in US society – a political revolution with the rise of mass democratic parties, an economic one with an expanding market, and a reading revolution as accelerating literacy along with pent-up social demand for reading material combined to fuel a market for news.

A reading revolution? Prior to the early nineteenth century, books and printed material of all sorts were “relatively scarce, literacy was uneven, and the circulation of information was slow.” At the turn of the nineteenth century, however, common schools expanded and, in turn, literacy rates skyrocketed, while the number of books and the speed of communication rose dramatically. Commerce, Carl Kaestle (1991, p. 52) says, was at the “root of the takeoff.” Literacy rates in colonial America had already surpassed most of northeastern Europe, reflecting a relatively egalitarian, individualistic Protestant society that emphasized reading and schooling as the path

to the Bible and faith. Literacy continued to rise throughout the nineteenth century, incorporating women too (Kaestle 1991, p. 19; Burrows & Wallace, 1999, p. 522).

The United States evolved from a society of scarcity of reading material to one of abundance during the early 1800s (Hall, 1996, intro; Howe, 2007, pp. 231–235; Nord, 2004). In the process, the very notion of how to read and its social significance changed. Journalism and the penny press were marked by this transformation. The daily paper, by nature, seems a product of an age of reading abundance where each print product is nothing to be treasured and closely read for the wisdom contained within. Instead the paper furnishes only the most topical of information with little lasting social significance. Already out of date by the next day, news by nature seems to be a compilation of facts without any tradition, rituals, or even narrative tying it to the community, or so James Carey (1997, Ch. 9) and Walter Benjamin (1969, pp. 155–200) have argued.

Before the 1820s and 1830s, high cost and low availability frustrated a great American desire for reading material (Brown, 1983, p. 302). Journalism's audience, too, was limited by price and content to the commercial and political elite. At six cents a copy and sold only on a subscription basis, the existing daily papers were unaffordable to the general urban population. Furthermore, their stories focused on such economic information as the markets and ship departures and the circumscribed polemics of the politicians, while ignoring "the events of daily city life that might interest the general urban population" (Burrows & Wallace, 1999, p. 522). The populace reciprocated the six-cent papers' disdain. Circulation remained under 2,000 on average, with the leading New York paper, the *Courier and Express*, pulling in only 4,000 subscribers.

Already in the 1820s, printers were seeking new readers and proposing a different economic model. It was first the labor press, motivated by the political contentions of the urban working class, which probed whether lower- and middle-class readers could sustain another model of journalism. The new labor press proved ephemeral, but Benjamin Day, one of its prime movers, recognized the new potential market. Launching the *New York Sun* in 1833, he initiated a wave of one-penny papers. Just like the cheap evening press that began in the 1880s, the 1830s penny press radically reduced the cost of a newspaper to a single cent and slashed production costs just as severely. In contrast to the traditional expensive "blanket" papers, penny papers typically were much smaller at $8\frac{1}{2} \times 11$ inches (Burrows & Wallace, 1999, p. 523; Saxton, 1991, pp. 96–97).

Unlike the six-cent papers, Day's *New York Sun* avoided expensive, long, and tedious news stories on world affairs or from the capitol. Instead, it focused on local news that would attract urban artisans (Burrows & Wallace, 1999, p. 524). Historians offer contrasting interpretations of this new form of the news. Certainly, all see the new daily penny press as introducing a more popular content focused on everyday life, reflecting a "democratization" of society and politics, although the press prior to the cheap dailies had also avidly sought the news and scoops.

The penny press, however, featured crime news. Early on, with the mysterious and grisly murder of New York prostitute Helen Jewett in 1836, it discovered new

talents of in-depth investigation and titillating storytelling. Reporters stationed at the courts found a ready supply of news they could mold into gripping narratives. The populace pondered the subtle significance of Jewett's death for the social order and so have historians ever since.

The news, suggest such historians as Schudson (1978), Karen Halttunen (1998), and Dan Schiller (1981), refracted the new importance of everyday life, the vernacular or the "social." In Schudson's accounting, politics lost pride of place in the journals' pages. For Schiller, in contrast, the penny press's news featured a sharp articulation of social tensions and fears. It attracted interest precisely from how it told the tale of society gone wrong. Crime and its subsequent probing in a court of law oft represented a story of social decay and elite corruption. In fact, nineteenth-century journalism in many ways adopted a quasi-judicial attitude. The news story presents an array of contending facts for the final arbitration and verdict of the reading public—jury (DeLombard, 2007).

Certainly since its origins, journalism has always functioned as an articulation of the "social." Along with reporting the explicit conflicts and opposed perspectives of politics, the press reiterates the shared moral codes of society. Journalism takes up select, seemingly non-political daily events and weaves them into a narrative of shared social rules – a story aghast at the violation of those rules and applauding the machinery of justice that reestablishes social order.

Fact-centered narratives of topical events, argues Jean Chalaby (1996), increasingly defined US and British (in contrast to European) journalism in the last half of the nineteenth century. In this interpretation, US journalism, unlike European, was peculiarly detached from the closely related fields of political competition and literary production. In contrast, in France journalists were oriented by the values of partisan politics and also seeking to establish themselves as prominent literary personalities; unadorned fact-driven narratives fell into the background, displaced by advocacy and commentary filled with ornate language and personal judgments.

While Chalaby's interpretation provides illuminating insights into the rising value of news in the United States and the distance between news production and the weak US literary field, he is clearly mistaken about partisan journalism. Political parties continued to command the loyalties of the US populace throughout the nineteenth century, and in turn, party competition dominated the reporting and interpretive understandings of the US press.

A. J. Liebling (1960) once quipped that "freedom of the press is guaranteed only to those who own one." But during the 1830s, the cost to enter the field of publishing was relatively low. Dozens of penny papers were launched in Eastern US cities (Burrows & Wallace, 1999, p. 525). Indeed, the 1830s represented a brief ideal moment, when the public sphere possessed a degree of openness, argues Saxton (1991, Ch. 4). Newspapers' prices were dropping, yet publishers did not require extensive capital to reach and hold a readership.

Recalling the early days of his penny paper, publisher Day remarked, "Capital! Bless you, I had not any capital" (Hall, 1996). Although the steam press had been

invented along with Koenig rotary cylindrical presses in the 1810s, US newspapers had yet to deploy these technologies, in part because their circulations remained local and small (Nord, 2004, p. 68). Indeed, Day's journal, the *Sun*, was first issued on a hand-cranked flatbed press that could print 200 papers in an hour. After the 1830s, "technology, spurred by mass circulation, then escalated cost of entry" into the market (Saxton, 1991, p. 105). In John Nerone and Kevin Barnhurst's (2001) analysis, the 1830s represented a turning point in newspapers' "mode of production." Journals shifted from an artisan-printer form of ownership and control to an industrialized economic model that relied on extensive capital investment and a strict division of labor between printers, editorial staff, and publisher-editor.

Partisan Press

The penny press spoke about its independence from parties and partly shifted its focus from the political to the social and even to the private and sensational. The first wave of cheap papers, however, largely participated in the Democratic Party's uprising against the earlier elite party journals. The new cheap papers at first disavowed political connections but such independence soon faded.

A "second wave" of more overtly political cheap dailies followed the first. They functioned in part as a Whig Party reply to the dominant Democratic alignments of the penny papers (Saxton, 1991, p. 102). In fact, the emergence of a mass press in the 1830s and 1840s was part and parcel of the democratization of the US political system. Newspapers were "the single most important connection between voters and party" (Baldasty, 1992, p. 14). The press supported the growth of the Whigs and the Democrats as they battled over the ideals and the spoils of US government, embroiling citizens in the passion of their conflicts. Throughout the nineteenth century, the vast majority of daily journals were firmly, publicly, emotionally aligned with one party or its opponent.

The demands of partisanship decisively affected journalism's economics, professional ethics, and news selections. As a loyal party organ, the newspaper accomplished a variety of political duties that demonstrated its commitment to the party (Kaplan, 2002, Ch. 1). First and foremost, a partisan journal must endorse the party's "men and measures" without expressing any doubts. When the party announced its slate of candidates, the journal naturally printed and endorsed the nominees. This published list, however, appeared not just once, but day in and day out for the entire election season.

Reporting too was colored by political preferences. The papers privileged the views and voices of the favored party while neglecting the plurality of views in civil society. Furthermore they reported events that supported the policy positions of their party while suppressing news of those that might weaken their party's electoral prospects. Journalism thus departed from such traditional ideals of the public sphere

as equal and open access, reasoned debate, and the unbiased reporting of all relevant information.

The editorial page typically operated with a simple, enthusiastic categorization of friends and foes. For the education of the readers, it published extended defenses of party policy. For their entertainment, the paper jeered the missteps of its political opponent. Throughout the second half of the nineteenth century, the majority of US newspaper editorials, in election season and out, pleaded the party's cause and defended its policies (Kaplan, 1997).

The daily paper was far from being an independent producer of information. Instead, the partisan paper was part of a public political community. Rather than operating as neutral transmitters of information, journals labored to build a shared partisan identity, either through democratic communication or through expressive rites of group loyalty (McGerr, 1986, pp. 14–22).

Given the partisan press's emphatic, evaluative voice, the news of the Gilded Age appeared irredeemably particular, plural, and personal. It emerged from a specific political community and stood opposed to the news of its political foes. Under the partisan direction of the publisher-editor, it appeared to possess a strongly unified, emotional voice. Indeed, the journal seemed to be crafted by the force of the editor's personality. In nostalgic accounts of the era, this was the last flowering of a personal journalism, before the arrival of complex bureaucracies and commercialized news corporations (e.g., Leupp, 1918; Watterson, 1918). In reality, nineteenth-century news was a mass-produced affair, contrived under multiple constraints, most notably that of party interests.

Nineteenth-century American political culture with its emphatic ideal of partisanship offered little support for an independent, impartial journalism. The parties' need to have a voice in every town and hamlet pushed expansion in newspapers, supporting journals that were economically floundering and inundating the market. Partisan papers were organized into networks and hierarchies within each state and nationally. Newspapers that were located in the state capitol or major cities and spoke for the major factions typically provided the dominant interpretations to other party organs in the hinterlands. Articles were reprinted, excerpted, and quoted, thus producing a weave of news and interpretation that united the party across the land. National party battles and capillary networks of news distribution helped cement a national culture, beyond all regional and social divisions.

Other political voices were consequently neglected or derided. Papers suppressed issues that conflicted with the party's agenda or potentially divided its electoral base. In the late nineteenth century, Republican journals refused to publicize the views of alcohol prohibition; both parties ignored or co-opted labor's demands (Folkerts, 1985; Goodwyn, 1978). In fact, when a series of railroad strikes and riots erupted across the nation in 1877, papers and party elites closed ranks. Newspapers – tied to parties, owned by the wealthy, and with a circulation limited to the upper third of the population – tended to disregard the interests of the mass of workers, poor, and immigrants. The press uniformly reacted to the strikes with hysteria and calls for

their violent suppression (Baehr, 1972, pp. 179–182; Kaplan, 1995; Nord, 1984; Slotkin, 1985, pp. 478–484). Until the arrival of Hearst, Pulitzer, and the cheap evening journals in the 1880s, the press was closed to the interests of the working classes.

As the century progressed, and party issues often faded into worn-out rhetoric, the press moderated its devotion to the affairs of parties. Newspapers juggled stories of a political character with those that were social or “human interest.” Politics, according to one measure, fell to 20% as a share of the leading stories (Baldasty, 1992, pp. 153–157; Rubin, 1981, pp. 58, 82). Even at century’s end, however, the majority of daily papers maintained an ongoing formal affiliation, a fixed public identity as party advocates (McGerr, 1986, p. 120).

In the end and despite their pretensions, the dominant English-language daily partisan press could never fully monopolize democracy’s public arena. A myriad of weeklies and monthlies, more or less ephemeral, publicized the concerns of African Americans, Native Americans, newly arriving immigrants, trade unions, women, and all shades and manner of protest movements. These journals stood as a constant reminder and rebuke to what was left out and ignored by the dailies.

Democratization of the Daily Press

Newspaper circulation into the 1870s hovered between three to four copies for every ten households. The press was purchased by a minority, read by the well-to-do, and largely directed toward the elite. In the waning years of the century, however, the press underwent a twofold revolution: first economic, then political. From 1870 to 1910, the daily press rapidly expanded to incorporate most US citizens into its audience. Journalism realized its long-cherished dream of circulating crucial political information to all citizens, encompassing everyone in a “republic of letters” (Leonard, 1995). Advertising and profits drove this media growth. By 1910, newspapers were full-scale incorporated companies, earning and expending thousands, even millions, paying dividends to stockholders, and just commencing their conglomeration into extended media chains (Smythe, 1993). Starting in the 1880s, cheap evening newspapers proliferated. These dailies targeted the urban working class and incorporated the mass of the population into the newspaper public.

The chief problem for any popular press, as publishing magnate Edward Scripps observed, was price. In the 1870s, Scripps noted, most newspapers still cost four or five cents, a hefty share of a worker’s average wages of a dollar a day. “Newspapers were luxury items,” Scripps noted (Britt, 1960, pp. 29, 61; Scripps, 1966, pp. 316–317). A number of media scholars have described the dynamic media economics that supposedly overcame this barrier to newspaper expansion and profits in the late nineteenth century. Harry Baehr (1972, p. 234), for example, writes that the new journalism of Pulitzer and Hearst “was founded on cheap, mass circulation with advertising footing the bill.” Richard Ohmann (1980; Norris, 1990, pp. 31, 35–37)

provides further details of this dynamic expansion in reference to the analogous 1893 revolution in magazine publishing. Three interlinked processes, Ohmann says, explain the explosive growth in the mass market for periodicals in the 1890s. First, lower magazine prices stimulated a growing readership. This burgeoning circulation, in turn, produced expanded advertising revenue. Magazines then employed the newly generated funds (along with a reduction of per unit costs of magazine production) to cut subscription prices further, which once again sparked a rise in circulation.

But in the 1870s and early 1880s, newspapers were blocked from adopting such a “dynamic” economic program by the high cost of newsprint paper and the relatively weak advertising market. According to James E. Scripps (1875), publisher of the *Detroit Evening News*, advertising demand “fell far short of the capacities of the papers to accommodate it.” Plenty of available newspaper space, but limited demand, resulted in a “demoralized” advertising market, where advertisers could dictate the terms of trade.

These obstacles were first circumvented, not by the giants of the New York publishing industry, but by small entrepreneurs in the Midwest. Publishers such as James E. Scripps and later his brother Edward Scripps proposed an all-around cutting of production costs. By implementing strict economies, publishers across the Midwest would launch a wave of cheap afternoon dailies and revolutionize the urban news market.

In 1873, Scripps launched the *Detroit Evening News* at two cents. Within three years, the *News* achieved financial success, and its circulation, although a mere 17,000 copies daily, overshadowed the circulation of all other Detroit journals. With its profitability assured, Scripps followed his Detroit venture with papers in Cleveland, Cincinnati, St. Louis, and Buffalo. Meanwhile, other publishers such as Victor Lawson in Chicago and William Nelson in Kansas City established their own cheap afternoon sheets. In each case, the journal was a short, scrappy bulletin paper, supplying an abbreviated but complete news report, and distributed to the urban working populations. The wave of newspaper growth across the United States in 1880–1910 largely rested on the expansion in number and circulation of these afternoon publications. Between 1870 and 1910 (the high-water mark for US dailies), the number of sheets published jumped almost fourfold, from 574 to 2,600. By 1910, evening journals constituted 74% of the dailies and between 1880 and 1910 they made up 79% of the gain in papers (Lee, 1937; Smith, 1964, pp. 341–343).

In the largest US cities, circulation surged from about five copies per ten inhabitants to slightly more than one for every resident in 1910 (Lee, 1937). By the early twentieth century, taking the paper was a daily habit among workers. In the early 1920s, Robert and Helen Lynd (1959, p. 514) surveyed the consumption expenditures of blue-collar households in Middletown: 100% subscribed to a daily journal. Indeed, other studies in that decade report that “newspapers were by far the most common reading matter of young workers, followed by fiction magazines, the ‘pulp’” (Denning, 1987, pp. 220–221).

In the 1880s, newspaper economics were shaken once more by changes that rendered the penny-pinching ascetic model of the cheap dailies outmoded. Rocketing

demand for advertising space and collapsing prices for paper stock compelled a reconstruction of the urban evening paper. These market conditions reflected more general transformations in the US economy, as it moved toward a mass-market, corporate-organized consumer society. Journalism acceded to a commercial logic of audience-maximizing and market concentration. Newspapers turned dynamic as they aggressively pursued advertising and audience with new contents, especially sensationalism. These economic shifts created essential preconditions, if not sufficient motive, for newspapers' later departure from their avid partisanship of the nineteenth century.

Advertising revenue at Scripps's *News* rose as a share of the paper's profits, rocketing from 38% of the gross profits in 1886 to 58% in 1889. US census data indicates that advertising as a proportion of both newspaper and magazine income mounted from 44% in 1879 to 49.6% in 1889 and continued in a steady upswing to 54.5% in 1899 and 60% in 1909 (Baker, 1994, pp. 14–16; Kaplan, 1995; Lee, 1937, pp. 748–749; Ohmann, 1980, p. 90). In the early twentieth century, journals across the nation reported a sudden influx of advertising revenue. Even country dailies in the heart of Kansas, such as William Allen White's *Emporia Gazette*, shared in the riches, as local merchants turned to advertising in their efforts to fend off the appeals of big-city retailers and mail-order catalogues (Griffith, 1989, pp. 78–91; White, 1946, pp. 377, 401). Throughout the twentieth century, advertising continued to make up 60–70% of all newspaper revenues.

This increase in ad lineage rested on a massive rise in “display” advertising. Department stores in the 1880s, following the lead of Wanamakers in Philadelphia, began to use full-page ads to entice customers into their stores in large numbers. They strove to attract customers from throughout the streetcar city, creating high-volume sales (cf. Leach, 1993, Ch. 1, pp. 61–62, 123). Henceforth advertising copy should be changed daily and large enough to draw notice. In the 1890s, Ohmann (1980; Chandler, 1980) explains, this tactic of the retail trade was followed by a push for publicity by national brands. In fact, the United States was shifting from an era of family firms serving local markets with a highly segmented demand to an era of corporate mass production for mass national consumption. Corporations invested ever increasing amounts of capital in fixed productive facilities, capable of high-volume manufacturing cheap goods. In order to make a profit from these investments, firms needed to stabilize consumer demand and construct national markets. The advertising boom enriching newspapers emerged as a key part of their strategy.

In place of the cheap, self-sufficient bulletin sheets that aimed at a limited market niche, there flourished a new dynamic, expanding newspaper – hunting for ever more news, readers, and above all advertising. This burgeoning appetite for readers led to keen competition among journals and eventually a saturated market.

A surfeit of advertising not only enriched the daily paper, but induced a reconstruction of the reigning practices of journalism. Newspapers, in Scripps's words, needed to be “fashioned for advertisers.” Increasingly, the demands of commercial publicity infiltrated the press; the daily paper was transformed into a vehicle for the organization and administration of consumer markets. Newspapers packaged subscribers as

much as they packaged news. In the process, the reader was no longer addressed only as citizen or engaged partisan, but also as a customer, consumer, and passive spectator (Given, 1912, p. 41; Seitz, 1916, p. 93).

First, advertising promoted an expanded, more variegated newspaper. Journals appended page after page in their hunt for customers and to clothe their added girth in paid publicity. In the course of the 1880s, Pulitzer's *New York World* jumped from four to eight to 14 pages, reaching 16 in the 1890s. More elite papers, for instance the *New York Post* and the *New York Tribune*, doubled their pages to eight just when they reduced their price to three cents in the early 1880s (Lee, 1937, pp. 322–326; Smith, 1964, pp. 342–343, 345). Following Pulitzer's lead, the press added sections that catered to an array of advertising interests and customers, most notably: sports, comics, and a woman's page (Baldasty, 1992, pp. 121–127; Griffith, 1989, pp. 215–216;). In 1927, as researchers catalogued the reading habits of passengers on New York subways, commuters seemed to prefer "sports, comics, photographs, and sensational stories of personal violence" (Gray & Munroe, 1930, pp. 43–44, 150, 179–180).

The needs of advertisers helped split big city journalism. In his popular 1904 manual, Walter Scott (1904, p. 382; Given, 1912) advised advertisers: "If [an advertiser] wanted to reach the better classes, he would use the morning papers; if he wanted to reach the laboring class, he would employ the evening papers." In addition, advertising shifted the very size and definition of the audience to which a journal was responsive. With advertising's growth, readers' pennies no longer directly counted. The individual paper stopped emphasizing a core community of readers especially interested in the news or tied to a shared public identity. Instead, with their prices falling, "the media began to focus on the marginal customer, who, despite little interest in the news and little willingness to pay for it, was the building block of the ever-bigger audience sought – and paid for – by advertisers" (Weaver, 1994, p. 46). The increasingly disparate content helped free the journal from the political demands of its readers. If the daily offended a reader because of a divisive political position, then there existed other, perhaps more important, bases of subscriber loyalty.

The economic transformation of the daily paper – from a (class or partisan) niche publication to one aiming at a mass, general market – certainly influenced the press's partisanship. Baldasty (1992; Smith, 1977), among others, has argued that the press fundamentally shifted its political identity and rhetoric during the second half of the nineteenth century. Newspapers, no longer dependent upon party subsidies but instead driven by the profits to be gained from large circulations and advertising, supposedly avoided divisive content. Baldasty contends they dropped the partisanship that was sure to offend some readers and instead embraced political independence, even objectivity. Papers ceased to address their audience in political terms – neither as citizens, nor as fellow partisans – but instead as consumers.

In all, however, the economic shifts in the 1880s and 1890s constituted a series of forces weakening, not eliminating, the newspaper's public, formal links with parties. A transformation in US political institutions and political culture would be necessary before journalism could break free from the sway of partisan readers and partisan interpretations of the daily events. In the waning years of the century, journals still

maintained a public party affiliation. US dailies, whether the elite *New York Times* or the popular *New York World*, found that their partisan identity continued to be economically advantageous. And to this day, even market-driven news continues to address its readers as citizens who are united and indeed captivated by stories of the nation in triumph and in tragedy.

Some historians contend that the growth of news transmitted by the telegraph along with syndicated content and the news wire services, most notably the Associated Press, undermined the partisan nature of the news, providing alternative models and inducements for impartial independent reporting (Carey, 1997; Chapman, 2005). A growing commercial news market required cheap sources of information and thus standardized content. This uniform news delivered by syndicated and wire news services, most notably the Associated Press (AP), supposedly weakened the plural partisan forms of political news. First known as the New York Associated Press, the AP dates back to 1848. It drew on member newspapers for its copy and its mission was to supply factual, non-controversial information at cheaper prices, ensuring that member papers could save money and avoid the risk of being scooped by rival papers.

From the start, the AP was mired in controversy. Begun by a coterie of New York papers, the news service was said to favor their interests. AP licenses were limited, and member papers used their control to excluded rivals, placing new publications at a disadvantage as they entered the market (Nerone, 2007; Starr, 2004, pp. 184–185). Further, in a sharply partisan political culture, charges of bias were inevitable, and indeed, the AP had notable links to the Republican Party. Such chargers found meat in the fallout over the controversial, contested 1876 presidential election (Nerone, 2007, p. 246; Starr, 2004, pp. 186–187). As a consequence, worries over concentrated economic power in the public sphere and control of public communication were first voiced in debates over the AP and the Western Union telegraph company. The two companies signed exclusive contracts in 1855, forming a mutually strengthening effort at monopoly control (Chapman, 2005, p. 62; Starr, 2004).

The political news from the Associated Press followed the journalistic conventions of the era. They provided long accounts of political events: meetings, marches, and speeches. The reports largely presented the words and chronology of the political event without interpretation and without partisan judgments or evaluation. In this sense, the wire reports were indeed neutral, but they also enabled the partisan press to persist with its traditional political biases. Each journal was free to publish the news reports that focused on the words and deeds of their favored party, while ignoring the wire reports that covered the opposed party.

Declarations of Press Independence

At the dawn of the twentieth century, the power of parties to dominate the US public sphere sharply declined. Two key episodes marked this toppling of parties: the critical

election of 1896 and the anti-partisan reforms of the Progressive Era, 1904–1919. Against this political backdrop, newspapers broke from all party ties and reformulated their role in US public life. Early twentieth-century newspapers relinquished their long political heritage as noisy, argumentative, biased party organs. The US press declared itself independent of all political attachments. In this transformation, the news evolved from plural, politicized, competing perspectives to an impersonal, unified discourse. Modern journalism proclaimed it would supply an impartial, even “objective,” authoritative account of the United States’ daily victories and defeats, and it would impartially arbitrate democracy’s public debates. In this manner, supposedly standing outside of all politics, the twentieth-century press strove to enhance democracy’s deliberations.

At first, the presidential campaign of 1896 seemed to signal an upsurge in partisan fervor. William Jennings Bryan and the Populist Party captured the Democratic presidential nomination and ushered new contentious issues into the political arena. Under the candidacy of Bryan, the Democratic Party emerged as the voice of protest and reform. However, the specific protest issues were quickly overwhelmed by widespread hysteria. *The Nation* declared, “Probably no man in civil life has succeeded in inspiring so much terror without taking life as Bryan.” Democratic papers deserted the party en masse. Conservative elite Democratic dailies like the *New York Times* and the *Detroit Free Press* issued “declarations of independence.” Even liberal, sensationalist journals such as Pulitzer’s *World* and Scripps’s *Cincinnati Post* dumped the party. In New York City, only the heretical Hearst trumpeted Bryan’s candidacy.

The press’s flight from the Democrats was reinforced by the fallout from the election. The emotional issues of the campaign fundamentally reshuffled the social coalitions underlying the two parties and, thus, disrupted long-standing ties of party loyalty. The election so weakened the Democrats that at both the national level and in the North and West they were demoted to a minority party. Elections became uncompetitive. Deprived of a significant choice, voter participation dropped from 84% in 1896 until it reached its nadir in 1920 at 53% (Burnham, 1970). From all-absorbing public drama, the fights and furies of the parties on Capitol Hill and in the pages of the press turned drab and unappealing.

In the early twentieth century, this explicit newspaper partisanship came to a permanent end. As party competition and polemics turned into an extraneous sideshow, the Progressive movement rose up to attack parties and their public legitimacy. In addition to vociferous criticisms of “corrupt party machines,” Progressives initiated reforms that undermined parties’ central role in political life: primary elections, direct election of senators, non-partisan ballots, and civil service reform (Burnham, 1970, Ch. 4).

In this context of fading party power and an anti-partisan ideology purveyed by a movement of the middle classes (along with attenuated economic ties), newspapers severed their links to the Democrats and Republicans. Historians have long noted the ties between press and the Progressive movement (Gans, 1979; Nord, 1995). Publishers and editors drew upon the political rationales of Progressive reformers to

reconstruct journalism's public role. Notions of "public service" and professional expertise became the rhetorical mainstay of journalism's occupational ideals and a defense against all external criticisms and pressures (Tuchman, 1972). In the American Society of Newspaper Editors' 1923 "Code of Ethics," the key words were factuality, independence, impartiality, and public service (American Society of Newspaper Editors 1960). In the face of widespread fears over monopolies, the idea of public service denied that such concentrations of power advanced private interests (Leach, 1993, Ch. 5).

The press asserted that its control over extensive powers of publicity was not employed for private goals or partisan ends. Rather, journalism was purportedly devoted to the general community and earned its rewards only for serving that public good. Progressive Era publishers asserted that professional technical expertise would direct their news choices and interpretations, instead of personal judgments and political evaluations (Kaplan, 2002, Ch. 5). Gradually, the press developed a claim to be above the wrangling of the public-political sphere (Alexander, 1981, pp. 23–39).

In its new public impartiality, the press supposedly did not operate as a platform for one dominant public voice, but rather as a "channel" for a variety of speakers. Ideally, new voices could gain access to the press, and enter into democracy's public discussion. More often, guided by their technocratic ethic, the dailies did not so much expand their coverage of civil society's diverse opinions as continue to publicize the policies and pronouncements of "important," legitimate speakers from formal political institutions. In contrast to the past, however, journals now balanced their coverage between the two legitimate parties. They no longer exhibited a preference for one party over the other. Wire service and hometown papers typically paired the statements of one party official with those of his opposite number (Kaplan, 1997).

Far from eliminating the influence of particular, class interests in politics and publicity, journalism's technocratic ideals took for granted the established hierarchy of power. Governmental and corporate power-holders were taken as the embodiment of modern industrial society's functional rationality. Their pronouncements should be reported, their decisions respected, not probed, much less challenged (Haber, 1964). In their 1920s study of Muncie, Indiana, the Lynds (1959, pp. 476–477) remarked, "It is usually safe to predict that in any given controversy the two leading papers may be expected to support the United States in any case, the business class rather than the working class, the Republican party against any other, but especially against any 'radical party.'"

Consolidation

Throughout the twentieth century, newspapers underwent significant economic transformations. Consolidation and closure of papers marched forward at a steady pace. By the 1970s, most cities functioned with just one journal. Concentration was

driven, in part, by the growth of newspaper chains, which bought up and consolidated rival papers in order to benefit from increased economies of scale and diminished competition. At the same time commencing in the 1950s, new rival media and alternative pastimes stole advertising and readers from the press. Journalism lost its central leading role in the average citizen's consumption of information and entertainment but continued to generate respectable profits.

By century's end, most newspapers were no longer family owned but instead publicly owned and traded on the stock exchange. Increasingly they were just one venture in a larger portfolio of media properties, while the parent company focused on recycling content among its synergistic "information platforms." These media companies often were committed to the traditional ideals of journalism only insofar as they strengthened their brand name.

By the 1890s, the newspaper industry had entered a "mature stage," where the growth in readership was accompanied, not by the founding of new journals, but by rising circulation in existing papers. Publishers confronted heightened barriers to the founding of new journals. On one hand, the requisite start-up costs and capital investment skyrocketed. Increased competition for news entailed a multitude of expenditures: a larger editorial staff to cover local news and sports, and the purchase of wire services and syndicate features. Soaring circulation necessitated the purchase of the newly invented typesetting machines and the latest model of Hoe cylindrical printing press (Curl, 1980, pp. 91–92, 141; Salcetti, 1995, pp. 51, 53). With such large sums of capital potentially at risk, newspapers had to be treated as a serious business in their own right; a charity, a platform, a public service only secondarily. Market imperatives and the concerns of business managers for profit weighed ever more heavily on the conduct of journalism. On the other hand, the number of readers needed to break even at competitive prices increased. New publishers needed to battle against the entrenched position of established papers before they could secure a large enough share of the market to return a profit (Caves, 1977, pp. 24–28; Seymour-Ure, 1968, pp. 105–108, 114–115).

In the early twentieth century, papers faced heightened competition and rising production costs. They often struggled and failed but more typically were bought out by rival papers. Indeed, consolidation made increased economic sense once market barriers insured that the elimination of any individual paper would not spur the entrance of new ones. Between 1879 and 1909, the absolute number of US dailies continued its impressive climb to 2,600. But thereafter, newspapers dwindled to 2,441 dailies in 1919 and 2,080 by 1932. In the early 1900s, select metropolitan markets already saw a frenzy of consolidation, frequently initiated by cold-blooded businessmen. One of the most famous, Frank Munsey, had already accumulated a fortune in magazine publishing when in 1912 he "embarked on his career of cannibalizing the financially weaker New York newspapers" (O'Connor, 1975, p. 66). One after another, Munsey purchased then merged or folded the *New York Herald*, the *Evening Telegram*, the *Morning* and the *Evening Sun*, and the *Globe and Commercial Advertiser*.

Economic conditions disproportionately favored the leading paper in each marketplace. Advertisers time and again patronized the leader. Consolidation meant that production costs could be spread across a greater number of consumers. By the 1940s, in “the typical mid-size city publishers no longer had a competitor or a prospect of one [. . .] Big cities usually had two or more dailies, an evening and a morning rag, with publishers able to carve the market by class” (Baughman, 1992, p. 11). The survivors of this national bloodbath – that is, the leading papers in each city or town – were rewarded with a relatively secure market position and a steady, even rich, stream of profits. Not even the onslaught of television would disturb the press’s financial complacency.

Until century’s end, reasonably run papers in “small or midsize markets could achieve profit margins well in excess of 30%. In major metropolitan markets, even with higher labor and associated costs, on the one hand, and a variety of free or targeted local niche competitors, on the other, profit margins were comfortably and consistently above 20%” (Knee, Greenwald, & Seave, 2009, pp. 174–176, 87, 91). In their economic security, newspapers were content to speak as the voice of the mainstream. Their editorials and news supported a politics of growth that assumed a harmony of interests among business’s desire for unimpeded commercial development, the paper’s greed for rising advertising revenues, and the public good of the community (Booth, 1910; Kaniss, 1991, pp. 52–9).

Group ownership helped drive the decline in newspaper numbers. Large chains with ready investment cash to expand and consolidate gobbled up papers. At the beginning of the twentieth century, eight groups controlled just 27 journals. Led by Hearst and Edward Scripps that number climbed to 63 groups owning 328 papers by 1935. In the final decade of the century, 135 chains controlled 1,228 journals (Pfaff, 2005, p. 65).

Chain ownership, for example, entered into St. Louis’s two-paper competition of morning and afternoon daily when Samuel Newhouse purchased the morning *Globe Democrat* in 1955. Newhouse had the financial weight and publishing skills to give the *Globe Democrat* a boost along with a reputation for turning financially distressed papers around and resuscitating them (Pfaff, 2005, p. 65). Instead of reinvigorated competition, the city’s two papers secretly signed one of the first joint operating agreements (JOA). The agreement restricted competition and combined production to save on costs, with the *Post-Dispatch* taking over the printing of the *Globe Democrat*. For the next three decades, the newspapers remained in close, semi-secret alliance (Pfaff, 2005, pp. 121, 123). JOAs became an increasingly common business practice in the 1960s. Faced by rising costs and mutually disadvantageous competition, such papers as Detroit’s *Evening News* and *Free Press* and San Francisco’s *Chronicle* and *Examiner* merged production operations, limited competition, and split profits, while remaining ostensibly independent editorially.

St. Louis publisher Joseph Pulitzer III declared the JOA was simply “a sensible business arrangement which in no way injures the public” (Pfaff, 2005, p. 125). And in authorizing the St. Louis JOA, the Justice Department agreed, saying the two

papers “could not exist separately.” Nor, apparently, could they survive together. By 1983, the *Globe Democrat*’s publisher remarked, “impending increases in costs of newsprint and the impending increases in labor and the other cost factors associated with the paper, the fact that we had priced ourselves to the maximum acceptable to the advertiser [. . . All these factors] indicated that for us, not too far in the future, it would be uneconomic for two papers here.” The *Globe Democrat* was sold in 1983 then permanently shuttered in 1986 after continued financial stress (Pfaff, 2005, p. 129).

Newspaper publishing costs remained high despite wage freezes, automation, and cuts in staff. US publishers sought to rein in the costs of the skilled union labor of typographers and printers by utilizing new technologies, but printers still controlled the physical production of the paper. The conflict frequently led to strikes with production being interrupted for days, even months. Already in the 1960s, farsighted analysts recognized that the computer was going to revolutionize the industry by eliminating the need for typesetters and changing the way pages were laid out and stories edited (Solomon, 1995).

Cascading developments were thus weakening newspapers. The press was defined by its ability to capture both audience and advertising. Gradually, both streams were sheared off by new media outlets and rival print forms with more cost-effective, specialized advertising. Although a cause for concern, they did not challenge the continued existence of papers until the 1990s.

Paper closures disproportionately hit evening dailies and their working-class, immigrant audiences, just as in Europe newspaper closings most often struck social democratic papers (Hoyer, Hadenius, & Weibull 1975). Daily papers in the United States have always been, by and large, local affairs. Their economic well-being, Kaniss (1991, pp. 22–28) says, has been tightly tied to the health and growth of a specific locale, and the news is correspondingly often focused on the dramas and issues that unite a metropolitan audience. In fact, “newspapers needed to produce local identity as much as they produced news.” But in the immediate postwar era, families were moving from the densely populated cities to the suburbs. In the 1950s, the 20 largest US cities saw close to zero growth, but the suburbs surrounding those centers jumped by 45% (Baughman, 1992, pp. 61–62; Pfaff, 2005, p. 327). As the suburban communities bloomed and workers no longer made the commute to the city center, those urban identities faded and evening newspapers lost circulation.

However, it was not circulation declines, Kaniss (1991, p. 35) argues, that weakened the evening papers, but the relative unattractiveness of their blue-collar readers to suburban advertisers. Furthermore, big department stores that featured full-page display ads in the paper also departed to the suburbs. Suburban dailies fit better the new social identities and advertising needs.

Throughout the first half of the twentieth century, readers remained faithful to their daily paper, notwithstanding the challenges of radio. In the 1950s, the share of the population purchasing a paper stood at 91%. But thereafter, readership commenced a long-term, persistent decline, falling to 57.6% in 1972. Kaestle (1991) partly

explains, “The spreading influence of electronic media indeed reduced the public’s use of newspapers” (p. 163). The decline was most severe among the younger and less wealthy population.

During the 1950s, advertising devoted to direct mail and television increased rapidly to equal that spent on papers, at the same time as the amount corporations spent on advertising in general skyrocketed (Auletta, 2003, p. 107; Schramm, 1960, p. 292). Having raised ads rates to a maximum through their tight control of the market, papers now saw new forms of advertising at a lower cost per thousand (cpm). Television was an important rival to newspapers in grabbing national advertising. In 1950, newspapers captured 25% of national consumer goods advertising, but by 1978, TV had become the dominant medium for national commercials, knocking papers down to 14% (Kaniss, 1991, p. 30).

The number of rival media for advertising escalated during the 1960s–1980s, including print and broadcasting. Some of those competitors, such as 31 free distribution suburban weeklies in the St. Louis metropolitan region, rivaled the average circulation of the daily urban press. When he shut down the *Los Angeles Evening Mirror* in 1963, *Times* publisher Norman Chandler testified before Congress that his papers had hemorrhaged advertising dollars to the accelerating competition of radio stations, television, and suburban newspapers along with community weeklies (Kaniss, 1991, pp. 31–32; Pfaff, 2005, Ch. 9, pp. 127, 260).

Media Corporations

Increasingly, newspaper corporations invested in a variety of media properties. The excellence of the *St. Louis Post Dispatch*, declared Pulitzer, was supported by the company’s investments in diverse media properties. “We went deliberately into television and radio and bought the *Arizona Daily Star* to enlarge and diversify this company so that it would have sinews and the ability in event of a crisis to maintain the central structure” (Pfaff, 2005, p. 132). Indeed, Pulitzer estimated that large urban papers could persist and indeed prosper only with an array of more profitable investments.

The *Chicago Tribune* too pursued a diversification policy in the 1980s, aggressively expanding into the direct mail advertising and buying television properties, while establishing zoned suburban supplements to their paper and tightening the bottom line. The Tribune Company soon metamorphosed into a broad content company with its newspapers no longer at the center of attention or revenue. Frequently this diversifying strategy meant the flagship journal gave the brand prestige, while a perambula of media properties with lower journalistic standards fed off the reputation and content of the brand carrier and brought in advertising and circulation (Auletta, 2003, pp. 103, 106–108; Pfaff, 2005, p. 260).

Decline in family ownership also played a role in the shifting orientation of the late twentieth-century US press. As the years passed, subsequent generations of family ownership frequently turned to squabbling over profits and control. “It is

common,” writes Daniel Pffaf (2005, p. 156; Auletta, 2003, p. 108; Baughman, 1992, p. 13), “after the third generation or so, for family members to choose other pursuits.” Typically, some heirs were given undivided control with others receiving just dividends. Quality newspaper management often meant lower dividends.

Inevitably, the development of diversified business strategies and the decline of the original family ownership, along with the paper’s integration into a broader media company, weakened the firm’s commitment to professional journalistic standards as well as the hunt for news. In their pursuit of investment and profits, family-owned papers often went public (Auletta, 2003, p. 104; Wendt, 1979). Increasingly newspapers responded to the demands of the stock market for high rates of return. Public ownership was concerned with dividends not quality journalism. The newspapers that most embraced this approach adopted innovations that challenged journalism’s traditional ideals, especially as circulation and revenues weakened. The economics of all papers, however, forced a reworking of the standard model. Papers frequently experimented with reducing editorial costs and staff. Cutbacks meant fewer reporters to track down stories, but most especially cutbacks in national and foreign bureaus and increased reliance on syndicated material. The Tribune Company’s non-Chicago journals gathered almost all of their national and international stories from the wire (Auletta, 2003, p. 79). Former *Chicago Tribune* editor James Squire bemoaned the takeover of “bean counters” at his paper: “What the *Tribune* is today is what every big newspaper is to its owners – a franchise. It’s viewed differently than newspapers used to be viewed. We used to think of it as a quasi public service to inform people about what they need to know [. . .] Today the owners view it as an information franchise whose job it is to make money” (Auletta, 2003, p. 97).

The arrival of the Internet challenged the fortunes and prestige of the daily press like no medium had before. The Web threatened journalism’s revenues, its audience, and even the press’s traditional role as independent authoritative interpreter of the day’s important events. The Web delivered a steady stream of news specialized to any interests or political viewpoint. It could even cover local news, the traditional competitive advantage of the local newspaper. From bloggers to such news aggregator sites as Yahoo, online outlets were usually parasitic off the print media’s production of reports yet they offered advertisers more specialized audiences at a lower cpm. Adding injury to injury, the Web too grabbed local advertising in the form of classifieds, most notably with Craigslist. Newspaper revenue from classified ads plummeted from a high of \$19.6 billion in 2000 to about half, taking in \$9.9 billion in 2008 (Jones, 2009; Knee, Greenwald, & Seave, 2009, pp. 87–89).

The Republican Century

In the early twentieth century, newspapers were independent, but their editorials overwhelmingly endorsed Republican candidates. The electoral realignment in the election of 1896 had weakened the Democratic Party, regionalizing it to a power in

the South but weak elsewhere. Newspaper publishers generally joined the upper class in its migration into the Republican Party.

When Franklin D. Roosevelt won the presidency in a Democratic Party avalanche in 1932, propelled by popular anger over the Depression, parties divided along class lines. Newspapers soon turned against the president, stridently raising their voices against Roosevelt's economic stabilization and social welfare measures. If one only read the pages of the daily papers in the run up to the 1936 election, then the entire country seemed to be in revolt against the president (Starr, 2004, p. 375; Wendt, 1979, Ch. 23).

To most everyone's surprise, however, Roosevelt won 60.8% of the vote in 1936, exposing how out of touch the papers were with public sentiment. Nevertheless angry reaction to FDR's social democratic policies continued to infuse parts of the country and newspapers in general. Such papers as the *Los Angeles Times*, the *Chicago Tribune*, and the Hearst chain were especially outspoken (Wendt, 1979, Ch. 23). Republicans, it seemed, owned the daily press, and in turn, Democratic voters listened to the radio airwaves to get their information (Lazarsfeld, Berelson, & Gaudet, 1960, pp. 521–523). Then as now, "partisans ascribed impartiality and veracity to the media which presented views similar to their own" (Lazarsfeld et al., 1960, p. 522). In 1939, 70% of the populace relied on radio for news, which 58% deemed more accurate. Only with the bombing of Pearl Harbor and the advent of global war did hostilities temporarily cease between press and presidency. World War II, notes James Baughman (1992, p. 1), boosted the interest in and sale of news, and at the same time, the press and other instruments of mass culture became "voluntary propagandists" for the government.

World War II also was a turning point for radio news and reinforced the public's reliance on radio, which in many ways forged the institutional patterns for television news. Radio as a mass medium first took off in the 1920s, but emphasized entertainment – music, sports, comedy, and serial dramas (Green, 1992). Appearing to offer little challenge to the daily press, radio's initial news broadcasts were a short recounting of the top headlines. In 1933, radio networks agreed to end a roiling conflict with daily papers by restricting broadcasts to two five-minute news segments each day and only reporting stories that were over 24 hours old. Instead, news commentators had a unique, national prominence (Fones-Wolf, 2006; Starr, 2004, p. 377).

The escalating military tensions in Europe during 1938–1939 captured the public's attention and gave radio news a distinctive opportunity. Offering interviews with European leaders or on-the-spot reports from the battlefield, such luminary reporters as H. V. Kaltenborn and Edward R. Murrow gave a powerful immediacy to the news in a direct personal voice. Their seemingly forthright speech, with its edge of urgency and danger, made the news more concrete and visceral than the daily press with its impersonal gray tones and gray type (Douglas, 2004). Statistics reveal the surging prominence of the airwaves as a source of information. By 1940, over 80% of the population owned at least one radio receiver, and US citizens increasingly said they trusted and preferred radio news to print (Starr, 2004, p. 377).

Despite the wartime reconciliation of press and Democratic Party, newspaper editorials overwhelmingly endorsed the Republican Party and its candidates until the 1980s, while news reports were usually even-handed between the parties, as “objective” journalists effaced their own viewpoints (Ansolabehere, Lessem, & Snyder, 2004). Shifts in newspaper ownership over time from family to public and the gradual acceptance of most of the achievements of Roosevelt’s New Deal, along with a liberalization in the 1960s and the debacle of the Vietnam War, altered this alignment of press editorials and Republican Party. By century’s end, dailies split their endorsements between the two parties. The *Chicago Tribune*, for example, had since the 1850s aggressively pushed a conservative Republican line. In the 1970s, with an increasingly professional management, the *Tribune* adopted a less partisan outlook, in line with other corporate journals (Auletta, 2003, p. 104; Wendt, 1979).

In general, twentieth-century journalism’s embrace of objectivity weakened its capacity to interject its interpretations and perspective into news narratives. And, if ever the press stepped outside of the nation’s two-party consensus, it faced accusations of bias (Bennett, 1990; Hallin, 1986, p. 10; Kaplan, 2002). Throughout the century, the US press typically adopted the perspective of political elites, while slighting the views of those who were marginal or dissenters. In war after war, the *Washington Post* confessed, the press “inevitably” functioned as the “mouthpiece” for the presidential administration (Kurtz, 2004), if only because the administration possessed a near monopoly of information and was buttressed by public belief in the rightness of the national security state.

In this sense, the US news agenda is not the product of newswriters. Rather the selection the news and its framing typically reflected broader constellations of public authority and political culture. More specifically, in Todd Gitlin’s accounting (1981, p. 271; Baughman, 1992, p. 112), the US press generally expresses the dominant hegemony, which in the twentieth century comprised the legitimacy of the national security state in the face of threatening enemies, the rightness of the market economy with its vastly unequal distribution of monetary rewards, the values of “free” individualism, consumerism, and private families as the foundation of the social order, and the ability of technical and managerial elites to manage social conflicts and make the necessary reforms.

Journalism History

Europe

Jürgen Wilke

ABSTRACT

Europe is the cradle of journalism. This does not only apply to the term, but also to the matter itself. The national and cultural diversity of the continent makes it difficult to generalize about its journalism history, but the rough outline of a common history is possible to recount. The earliest printed newspapers presented a correspondent's journalism. These were followed in most countries by journals of opinion. Commercialization in the nineteenth century produced a more popular journalism. Professionalization began in the nineteenth century also. The development of journalism in Europe in the twentieth century was above all influenced by two groups of factors. On the one hand, there were restraints resulting from the political conditions of this century. On the other hand, there were technical innovations which produced new mass media. At the beginning of the twenty-first century, journalism in Europe (as in other parts of the world) is again in a process of extensive change.

Europe is the cradle of journalism. This does not only apply to the term, but also to the matter itself. The term has a French origin, deriving from the French word for "day" (*jour*). It came into use as a result of the French Revolution in 1789 when the printed press became a forum for opinion-making (Barnhurst & Nerone, 2009, p. 19). In the nineteenth century, the concept also established itself in other European

countries. However, the job title “journalist” had already been used earlier, at first probably for the staff of the *Journal des Sçavans*, the first scientific magazine that had been launched in Paris in 1665. Only at the end of the eighteenth century did “journalist” receive its more general significance and slowly substituted older terms, e.g., the German word *Zeitungsschreiber* (“newspaper writer”). In many European languages, “journalism” and “journalist” became popular, not only in French and English, but also in German (*Journalismus*), in Italian (*giornalismo*), in Portuguese (*jornalismo*), and in Czech (*žurnalismus*). Spanish is an exception, focusing on the regularity of the function as the core of the term (*periodismo*).

It depends on the definition of the term when and where the history of journalism starts. Chalaby (1998), who defines it as a “field of discursive production” (p. 334) with its own norms such as objectivity and neutrality, spoke of journalism as an “Anglo-American invention” and dated it back to the nineteenth century. But this would ignore the fact that well-directed efforts to obtain and to distribute news are much older. If journalism is actually defined more generally, namely according to Barnhurst and Owens (2008) as a “constellation of practices that have required special status within the longer domain of communication through a long history that separated out news sharing from its origins in interpersonal communication” (p. 2557), its history goes further back.

Europe is a continent with numerous countries and languages. Today, there are approximately 50. The modern political order has developed since the Middle Ages and has been changed again and again by wars and power–political arguments. Some countries were able to keep their identity for a long time, e.g., Great Britain, France, and Spain. In general, these were centralized states. In other countries, e.g., in the German Empire, federal structures existed. Germany and Italy only became nation-states in the nineteenth century, other countries only in the twentieth (e.g., Czechoslovakia) or after the political change in 1989 (e.g., Slovenia, Croatia). The changes in European history naturally influenced journalism in Europe in a variety of ways.

Europe also has a multitude of languages. In principle, this results in obstacles to communication. Besides several Indo-Germanic languages, which also include the Roman and the Slavic languages, there are Uralic languages (e.g., Finnish and Hungarian).

The cultural variety of Europe makes it difficult to describe the history of journalism on this continent coherently. As a result of political and language barriers, this field of activity developed respectively mainly in the national context. This also applies to its scientific exploration, which moreover has mainly concentrated on the history of the press (and other media) and less on the history of journalism as professional practice. Thus there are primarily national presentations of press history available, for England (Andrews, 1968; Aspinall, 1973; Boyce, Curran, & Wingate, 1978), France (Bellanger, Godechot, Guiral, & Terrou, 1969–1972), Germany (Stöber, 2005; Wilke, 2007, 2008), Italy (Murialdi, 1995, 1996), and Spain (Barrera, 1999; Fuentes & Sebastià, 1997). Only a few exceptions are comparative and transnational (Dooley & Baron, 2001; Mompart & Otto, 1999; Smith, 1979; Welke & Wilke, 2008).

Despite these national differences, the history of journalism in Europe also has commonalities and similar developmental courses. Besides influences between European countries there were also extra-European – particularly US – influences. These influences varied, however, over time and had differing dynamics.

Prehistory of Journalism

If journalism is thus generally defined that its basis is news, i.e., not private news, but news satisfying public interest, this job already existed before technical means of distribution were available. Thus it is possible to speak of a prehistory of journalism (Baumert, 1928; Barnhurst & Nerone, 2009). The human interest in news is given by nature and motivated by society. It was satisfied in the Middle Ages by persons such as singers and gleemen who moved from place to place and informed people about events they had heard of. In Germany, these gleemen were later called *wandernde Journalisten* (“wandering journalists”; Scherer, 1920). In England, the presenters of ballads and commemorative poems fulfilled a similar function. From the eighth century, events were laid down in written form in the “Anglo-Saxon Chronicles”. They may thus be regarded as a “precursor of the press” (Giffard, 1982).

The need for news grew in early modern times due to expeditions, discoveries, and the expansion of trade relations. Large trading companies fostered an extensive correspondence with their branches. In Europe, real information exchange networks developed; their basis was the extension of the post lines (Raymond, 2006). In this context a real trade with written news developed. In the early seventeenth century, Philipp Hainhofer ran an office in the South German city of Augsburg where news was copied and delivered to interested persons – mostly sovereigns (Schmolke, 1962). Benedetto Dei had done something similar a century earlier in Venice. There, hand-written *avvisi* developed out of traders’ letters (Infelise, 2002, 2007). In France, *nouvelles à la main* also circulated, and indeed still later, as they remained outside the supervision of the authorities (Bellanger et al. 1969–1972, vol. 1; Moureau, 1999).

The Corresponding Journalism of the Early Press

The decisive precondition for the development of journalism in Europe was the invention of printing technology by Johannes Gutenberg in Mainz in the middle of the fifteenth century. With this, it became possible to produce and to distribute writings and messages quickly and in large numbers. First, this technology was above all used for clerical and religious purposes. But soon it was also used to copy news. As printing shops soon also developed in other places in Europe, such prints were produced in many countries. They had different names, but were widely similar with

respect to content and form (Dooley & Baron, 2001). In Germany they were called *Neue Zeytungen*, in the Netherlands *Couranten*, in France *Canards*, in England “Corantos,” “Diurnalls,” or “Newsbooks,” in Spain *Relaciones*, and in Portugal *Relações*. In Venice, they got the name *Gazette*. These individual prints mostly described political, military, and social events, but also disasters and sensations.

The printers received this news from correspondents who were in places where important events happened or where much information from other places passed through. These correspondents thus fulfilled a journalistic function. This justifies the concept of a “corresponding journalism” (*korrespondierender Journalismus*; Baumert, 1928). In general – as was the case for written newspapers – three groups of correspondents came to the fore (Wilke, 2008): (1) civil servants and legates residing in sovereign courts or on diplomatic missions; (2) representatives who were based in other trading towns for their companies; (3) educated correspondents, members of universities and monasteries. These three groups were able to deliver news of different kinds, i.e., political, economic, and cultural news.

Over a century elapsed before *Neue Zeytungen*, *Corantos*, *Newsbooks*, *Diurnalls*, etc., became the periodic newspaper, the first mass medium of modern times published regularly with specific publication intervals. As far as we know, this occurred for the first time in Strasbourg in 1605 after several intermediate stages. The printer Johann Carolus started to print written news and to turn them into a weekly newspaper (*Relation*). The first complete volume dates back to 1609. In the same year, a second newspaper in Germany (*Aviso*) was published. This “business model” was so successful that soon newspapers in other places followed.

Germany led the way in the development of the newspaper; in the seventeenth century, there existed more newspapers in Germany than in all other European countries put together. In other European countries it took years or decades before they were ready (Dooley & Baron, 2001; Welke & Wilke, 2008). The first followers were the Netherlands. In 1618, the first newspaper was published in Amsterdam, followed by Antwerp in 1620. In France, Théophraste Renaudot introduced the first weekly newspapers to the market in 1631 (*Gazette*). The *Oxford Gazette* (1665) is considered the oldest periodic newspaper in England and was preceded by numerous newsbooks (Raymond, 1993, 1996). In 1666, it changed its name to *London Gazette*. In Spain, the earliest known newspaper was in Barcelona in 1641 (*Gaceta Barcelona*); 20 years later, the *Gaceta Nueva* in Madrid followed. In 1643, the first Italian newspaper was published regularly, two years later the first one in Swedish (*Ordinarie Post Tijdender*). Newspapers in Polish followed in 1661 (*Merkuriusz Polski*) and in Danish in 1672 (*Extraordinaire Relation*). The first Russian newspaper was published in 1703.

The newspapers of the seventeenth century (and the majority of those of the eighteenth century) were very similar to each other (Wilke, 1987b). They were in quarto or octavo and consisted of four to eight pages. They mostly offered sober written accounts of political and military events from different parts of Europe, provided by the correspondents on location. Thus it was still “corresponding journalism.” More journalistic functions were not yet necessary. News selection was not

needed as the news flow was still limited and all available information was printed if possible. A layout with headlines and captions was abandoned. The accounts were merely supplied with the name of the location and the date of their origin. They mainly came from other countries, meaning that there was a dominance of foreign correspondence. In England, this declined very early on (Wilke, 1987a, 2010).

To begin with, printers did their work without journalists, and a newsroom was not necessary. We know only of a few cases where news in the seventeenth century was edited and (linguistically) processed by a person whose particular responsibility this was. The news flow increased in the eighteenth century in such a way that someone had to assume the task of selection and preparation for printing. But only large newspapers which attached importance to original accounts and which did not want simply to reprint other papers (which frequently happened) could afford this.

Articles expressing opinions were also almost completely absent from early newspapers. Correspondents did not wish to tell readers their personal views, but inform them so that they could form their own opinions. Their perception of their role, so to speak, was to be neutral, objective correspondents. This conception was also due to press control. In the decades after the invention of printing technology, censorship and other controlling measures had been introduced in all European countries (Siebert, 1965). The periodical press was also subject to these measures. The publication of undesired news and opinions would thus have been inhibited. The newspapers mainly addressed an educated readership; knowledge for understanding the coverage could be assumed. Circulation was still limited and amounted to hardly more than a few hundred copies.

The Development of Opinion Journalism

In the eighteenth century, the role of journalism in Europe started to change. This first happened in England, for several reasons. When the British parliament did not renew the Licensing Act in 1695, there was in practice press freedom (Siebert, 1965). Henceforth there was no pre-censorship of printed material. Although there were other prohibitive measures, be it with the help of charges at court or as a consequence of the tax on printing paper (stamp tax), newspapers could now become organs of public debate – the more so as England had a long-established parliament in which controversial debates were conducted. However, parliamentary reporting remained regulated even after 1695 and has only been tolerated since 1772.

As early as the sixteenth century, special print media had developed to publicly multiply opinions and convictions. They were called *Flugschriften* in Germany (Wilke, 2008) and “pamphlets” in England (Raymond, 2003). During the Reformation and the subsequent religious conflicts, they achieved a huge circulation. They were mostly written by the spokesmen of religious and social movements themselves and

thus were not actually journalistic products. In the Catholic countries of Europe, there were fewer of them and they did not flourish.

The abolition of the Licensing Act in England not only led to a rapid increase in the number of newspapers. Strong competition also developed, so that papers now and then shut down very quickly. The *Daily Universal Register* was one of the longer-lived papers. It appeared for the first time in 1785; three years later it was renamed *The Times*, the newspaper which was to become the flagship of independent British journalism. In this phase, newspapers in the United Kingdom began to differ from those on the Continent. They could take greater liberties both with regard to content and style. Journalists neither wanted nor were forced to restrict themselves to sober information, but could also express their opinions. It was advantageous that with the Whigs and the Tories, a bipolar party system already existed in England. However, this journalism was often non-autonomous, as many papers were financially supported by the government, the parties, or other social groups (Aspinall, 1973).

In other European countries, opinion journalism developed later than in England. In France, freedom of opinion and press was introduced in 1789 by the Revolution. Until then, control in this centralized state had been particularly strict. Basically, there was only one single newspaper: the *Gazette*, founded in 1631. It appeared in Paris, but was reprinted in provincial towns. Criticism could be found at most in the philosophic magazines of the Enlightenment (Censer, 1994). However, information which could not be published in the French kingdom could be printed in the exile press, which was represented by several titles (above all in Holland and on the Lower Rhine). Forbidden prints were produced clandestinely and smuggled over the border.

In 1789, the outbreak of the French Revolution led to an explosion of the press in Paris; above all, it now published opinions. Within a short time, the number of press organs rose to hundreds (Bellanger et al., 1969, pp. 443–461; Popkin, 1990). Several prominent and radical revolutionaries worked as journalists, among them Camille Desmoulins, Jean-Paul Marat, and Jacques René Hébert. At first, press freedom made it possible for ideologically and politically competing organs to coexist, even those supporting the monarchy. However, this changed when the king was arrested and executed in 1791, after which all necessary measures were taken to silence the supporters of the old system.

Evidence for a new understanding of the journalistic role also arose in Germany in the late eighteenth century where, again, it was primarily writers who spoke out for the Enlightenment. One of them was Wilhelm Ludwig Wekhrlin. His ideal was the journalist as *Spion des Publikums* (“spy of the readers”), who not only conveyed news, but also warned readers against false ideas (Wilke, 1993). He also called the journalist a *Sittenrichter* (“judge of public morals”) and an *Advokat der Menschheit* (“advocate of humanity”), and thus anticipated modern concepts of the role. In practice, this understanding of the role could hardly be realized. Although there had actually been a certain relaxation of press control in the German Empire in the eighteenth century, the French Revolution led to a further tightening of control when German sovereigns felt threatened by the spread of revolutionary ideals.

Starting in the eighteenth century and increasing in the early nineteenth century in most European countries, writers and poets tried to work as journalists. This has led to the characterization of “literary journalism” (Baumert, 1928). Famous authors like Balzac, Dumas, and Hugo in France, Heine and Fontane in Germany, and many less renowned writers earned their living at least temporarily by working as a journalist. For others, journalism was a starting point or transition stage in their striving for a political career. This has shaped the image of journalism in these countries for a long time (O’Boyle, 1967/1968).

It has been claimed that since its beginning, the press was a male domain. However, this does not mean that women were insignificant. They were already active in the English newsbooks of the Puritan Revolution (Nevitt, 2006). In Germany, women were frequently owners of print shops as early as the seventeenth century if their husbands died and they continued their work. Here, however, female journalists appeared for the first time in the eighteenth century as editors of magazines addressing a female readership (Madland, 1988). In the political press, female journalists were admitted only later. In Germany, Louise Otto published the *Frauen-Zeitung* (“Women’s Newspaper”) after the 1848 Revolution, promoting women’s interests and needs. In Victorian England a women’s press movement started and formed a women’s political press (Tusan, 2005).

Commercialization in the Nineteenth Century

As late as the early nineteenth century – in some countries even much later – journalism in Europe suffered from official control or dependence on financial support. Further suppression at the beginning of the century can be attributed to Napoleon Bonaparte, who strictly regimented the press. He used it as a political means of power, reduced the number of titles, and decreed that only *Moniteur*, the state newspaper, could be reprinted. In 1811, he re-established censorship in France. His influence also led to a disciplining of the press in other countries. The press was impoverished, but also released opposing forces in Prussia and Spain. When Napoleon had to abdicate in 1815, a glorious new era for the press and journalism seemed to dawn, but this did not last long. In the German Confederation, strict censorship was again decreed in 1819 for three decades, and even in France the return of the Bourbon monarchy led to restoration of censorship. The July Revolution of 1830 brought an increase in oppositional organs which could no longer be suppressed despite new attempts to limit their liberties.

However, the scope of the press was also limited commercially. The political newspapers had to finance themselves mainly via their sale price. In the eighteenth century, advertisements could be published more or less only in special prints: “Advertisers” in England, *Intelligenzblätter* in Germany, and *Affiches* in France. Only after liberalization of the state advertising monopoly (in Prussia in 1850) and the

abolition of the advertisement tax (in England in 1855, in Germany in 1874), could commercialization of the press begin in these countries. In the United States, this development had already commenced in the 1830s, when publishers there created the popular mass newspaper, the penny press, which offered completely different content than the previously dominant party press. This example was first followed in France. In 1836, two newspapers of the *presse à bon marché*, as it was called there, were published: Emile de Girardin's *La Presse* and Armand Dutacq's *Le Siècle*. Both made advertisements their essential support and financial source. Thus the sales price could be lowered and mass circulation could be achieved. Formation of political opinion, however, was not yet relinquished. To catch the interest of more readership groups, the cultural part (*feuilleton*) of the newspaper was created. At the end of 1836, *La Presse* had a circulation of 10,000 copies; ten years later it was 20,000 copies; during the Revolution of 1848, it was allegedly sometimes even 70,000.

In the nineteenth century, *Le Petit Journal* became the most successful newspaper in France (from 1862). It was cheap; its price was only half as much as that of *La Presse*. The content consisted mainly of the mediation of practical knowledge and news from daily life, especially miscellaneous news (so-called *faits divers*), as well as novels "below the line." After two years, 260,000 copies of the newspaper were being printed; in 1887, it was 1 million. Palmer (1983) considers *Le Petit Journal* as "la naissance du journalisme moderne" ("the birth of modern journalism") in France. This also included reportage and interviews as new journalistic forms of presentation. The names of *grands reporters* became famed (Martin, 2005).

Starting in the 1850s, the popular daily press also became established in Great Britain (Engel, 1996). The trigger had been the abolition of the stamp tax in 1855. The opener was the *Daily Telegraph and Courier* in the same year; it would increase its circulation to 250,000 copies by 1880. Several further cheap mass newspapers were launched around the turn of the century: *Daily Mail* (1896), *Daily Express* (1900), and *Daily Mirror* (1903).

In Germany, the commercialization of the press started later than in Britain. Opinion and party press had only come into existence after the 1848 Revolution, and it only gained ground when the German Empire was founded in 1871 and a national parliament existed. The beginnings of the mass newspaper date back to that time. The special newspaper type which developed was called *General-Anzeiger*. It was also mainly financed by advertisements and tried to win a broad readership, above all with the help of local coverage and renunciation of political and religious controversies. Entertainment was also given much space. *General-Anzeiger* were published in Berlin and other large cities and achieved a circulation which until then had not existed in Germany.

In the nineteenth century, the exemplary function of US journalism took root in many places in Europe, above all in Great Britain. Thus it became common to talk of the Anglo-American model. Later, US customs in journalism also swept through other European countries (Høyer & Pöttker, 2005; Broersma, 2007). But the key word "Americanization" also frequently had a negative overtone. The phenomenon

described by this was considered a threat to indigenous (journalistic) culture and was therefore rejected. In Germany, at least, one must speak of the “belated modernization” of journalism. The US author Mark Twain stated this satirically at the beginning of the 1880s. After providing a formidably long list of what he felt was missing from German papers – humorous columns, police court reports, prize fights and dog fights, horse races and other sporting events, banquet speeches, curious oddities, etc. – he addressed the question of what such papers actually did contain:

It is easily answered: A child’s handful of telegrams, mainly about European national and international political movements; letter-correspondence about the same things; market reports: There you have it. That is what a German daily is made of. A German daily is the slowest and saddest and dreariest of the inventions of man. Our own dailies infuriate the reader pretty often; the German daily only stupefies him. (Twain, 1880, pp. 281–282)

A movement like the early twentieth-century muckrakers in the United States did not emerge, although social reports developed in Germany and Austria. However, they were generally published not in the independent press but primarily in the party press and low-circulation magazines of the Left (Requate, 2004).

The Professionalization of Journalism

During the course of the nineteenth century, a professionalization of journalism started in Europe. The need for journalists increased because the press expanded in several respects. Above all, innovations in printing technology contributed to this expansion. The number of newspapers increased considerably, formats became larger, and the number of pages grew. Content also became more varied, which led to a differentiation into different sections. In the middle of the nineteenth century, newspaper readers had 30–60 times as much to read as those two centuries before (Wilke, 1987b).

Before 1848, the number of journalists in Germany was estimated at around 400; at the end of the century there were probably 2,500 (Requate, 1995). However, this would still not be enough. The London *Times* had considerably more foreign correspondents at its disposal than did French newspapers (Chalaby, 1996). The increase in personnel was accompanied by an extension of editorial departments (Wilke, 2003).

Contrary to popular assumptions, journalists in the nineteenth century were highly educated. The profession attracted intellectuals and literate persons who did not have any other job opportunities in society or were refused due to political reasons. The development of professional unions also underlined advancing professionalization. Between the 1880s and World War I, such organizations were founded in all the largest European countries (Kutsch, 2008, p. 325).

Between Political Instrumentalization and Technical Innovation: Journalism in the Twentieth Century

The development of journalism in Europe in the twentieth century was above all influenced by two groups of factors. On the one hand, there were the restraints resulting from political conditions. On the other hand, there were technical innovations which produced new mass media. These mass media again constituted new challenges for journalism and forced it to adjust to changing demands.

Historically, the twentieth century was above all characterized by totalitarian regimes and two world wars. These circumstances more or less restricted the autonomy of journalists in many countries and even destroyed it. In Russia, where the liberalization of the press after the death of Czar Nicholas I in 1855 had started comparatively late, the Bolshevik Revolution of 1917 led to the establishment of a totalitarian communist system. Following the guidelines of V. I. Lenin, journalism had to fulfill three tasks: propaganda, agitation, and organization. With this, journalists were again degraded to servants of political rulers. As a consequence, journalism in the Soviet Union was called the “antithesis of the Anglo-American news paradigm” (Lauk, 2005).

It was not very different in the fascist dictatorships established in Italy in the 1920s and in Germany after 1933. Journalists were to serve the ruling ideology and to support the goals of the government. For this, the Nazi regime in particular erected an ingenious system of media control. Besides legal regulations and organizational means, it consisted of detailed instructions to the correspondents of German newspapers during official press conferences in Berlin (Wilke, 2005). Importance was also attached to journalistic formation aligned with the purposes of party and government. Although Minister of Propaganda Joseph Goebbels did not wish to have a uniform press as this would have aroused suspicion among the population, newspapers were to express the same things with different voices.

Journalists were under particularly intense pressure during the two world wars (1914–1918, 1939–1945). As a general rule, censorship was again introduced in all the countries involved and there were attempts to turn the press into a means of propaganda. This even applied to countries which had retained their democratic order, such as Great Britain. Here, official authorities were also instructed to influence journalists, who were to represent the interests of their countries to the outside world and to strengthen the war morale of the indigenous population.

After World War II, this open or hidden instrumentalization of journalism generally came to an end in the democratic countries. Europe was now divided into two blocs: the West closely linked to the United States, and the Eastern bloc to which the Soviet Union extended its power. The Eastern bloc consisted of the Baltic countries, Poland, Czechoslovakia, Romania, and Bulgaria, as well as Yugoslavia, which strived for a certain autonomy. The German Democratic Republic that had been established

on the territory of the Soviet occupation zone in Germany in 1949 was also among the Soviet satellite states. In all these countries, the Soviet model of journalism was introduced and imposed with state instruments of power. In the authoritarian regimes of Europe still existing after 1945 (Spain, Portugal), journalism also remained under state influence, although this was less strictly exerted than in the communist countries (Fuentes & Sebastià, 1997, pp. 253–276, 293–316).

Development in Western Europe was different. With the restoration of democracy, the environment for journalism also changed. In the Western occupation zones of Germany, the Allied powers strived to create the conditions for a free and independent journalism. Above all the Americans tried to ensure that their journalistic models were adopted by the Germans. In the early postwar years, they tried to do this by means of strict control and direct instructions (Wilke, 2003). One of the central norms was the separation of news and opinion in order to overcome the opinion journalism that had been cultivated in Germany since the end of the nineteenth century and which had been taken to extremes under the Third Reich. One of the guiding principles of the US “re-education” of German journalists was: “It is the duty of a non-partisan press to serve the public impartially with unbiased presentation of the news” (cited by Wilke, 2003, p. 68). Intentions to restructure the newsrooms of German daily newspapers according to the Anglo-American model failed, however, to be realized.

Undoubtedly, there was an “Americanization” of journalism in (West) Germany after 1945. One example is the acceptance of the “inverted pyramid” news form with “lead” and “body.” Previously, this had hardly been used in German journalism. On the other hand, “Americanization” was also opposed. The chances for a continuation of German traditions increased when the Federal Republic of Germany became sovereign in 1949 and press freedom was introduced. Skepticism regarding a thorough Anglo-American influence on German journalism has been confirmed by the findings of scientific studies since the 1970s. They revealed the wish to criticize grievances and champion values and ideas as the primary professional motivation of German journalists, ahead of neutral information brokerage. A comparison of German and British journalists can be summarized by the alternatives “missionary” and “bloodhound” (Köcher, 1986). Another study showed that US journalists wanted to advocate ideas and values considerably less than did their German and Italian counterparts (Donsbach & Patterson, 2004).

Another difference between British and German (and continental) journalism is the organization of the newsroom and the editorial departments (Esser, 1998). Journalistic work in Great Britain is based on the division of labor; different tasks, from the research of information to the layout of the newspapers, are performed by different persons (the principle of editorial control). In Germany, on the other hand, the holistic organization still dominates; all tasks are or can be completed by one journalist, i.e., a journalist both reports and comments (the principle of journalistic autonomy).

These differences are also based on different press systems. The newspaper market in Great Britain is the most strongly commercialized market in Europe. In this

market, the London tabloid newspapers dominate; they have to be sold in the street every day and thus try to attract readers with revelations, sensations, “sex and crime,” etc. Even *The Times* adjusted to this trend. In Germany, the regional and local press are still dominant; they are delivered to subscribers and do not have to convince their readers to buy them again each day. The sensation press is only represented by one title, *Bild*, although with a high circulation.

After 1945, a new beginning and the continuation of traditions also came together in Italian journalism. After restoration of press freedom, new newspapers were launched (Murialdi, 1995, 1996). The party system was fragmented. The parties needed their own outlets, which led to a revival of the opinion and party press. “Political parallelism” is reflected in this. According to Hallin and Mancini (2004), this is characteristic of the “Mediterranean and polarized pluralist model” of media organization. Italy (as well as other Southern European countries) is a prototype for this. Journalism has political and literary roots. A mass circulation press never fully emerged. “The style of journalism tends to give substantial emphasis to commentary. Newspapers tend to represent distinct political tendencies” (Hallin & Mancini, 2004, p. 98). Polarized pluralism is produced by many distinct parties, ranging over a wide political spectrum. In contrast, there is the “North/Central European or democratic corporatist model”. The Scandinavian countries, the Netherlands, and Germany adhere to this model, with typical forms of social regulation and with three coexistences: between political parallelism, a mass circulation press, and a high level of journalistic professionalization. Great Britain (and the USA) is assigned to the third model, the “North Atlantic or liberal model.” Commercial newspapers developed rather early, with little state involvement, marginalizing media with distinct ideological viewpoints. “In each, an informational style of journalism has become dominant and traditions of political neutrality tend to be strong – though with very important exceptions in the British press” (Hallin & Mancini, 2004, p. 198). A scandal shocked the public when the British tabloid *News of the World*, owned by Rupert Murdoch’s News Corporation, was closed in July 2011 due to allegations of phone hacking and corruption.

The development of journalism in Europe (as in other parts of the world) in the twentieth century was furthermore influenced by technological innovations. The discovery of wireless telegraphy resulted in the development of the radio as an auditory mass medium. All European countries introduced this new medium in the 1920s. Radio was mostly organized by the state or had close links to the state, except in Great Britain: here, the British Broadcasting Corporation (BBC) adopted the character of a public service company in 1927 with a Royal Charter. The Italian fascists also introduced this model. The nature of audio and the organizational structures had consequences for journalism in broadcasting. The medium itself was often used for education and entertainment, but informational broadcasts were also included. Journalistic formats were first determined by the example of the press; over time they were supplemented by specific presentational forms such as reportages and interviews.

After World War II, another mass medium arose: television. Although its beginnings date back to well before the war, its distribution had been interrupted and

delayed by hostilities. Thus television started more or less at the same time in the 1950s in most European countries (Bignell & Fickers, 2008) and rapidly established itself within a decade. In some countries (e.g., France) its organization remained close to the state; in the Eastern bloc it belonged completely to the state (as did radio). The majority of Western European countries followed the BBC model and offered TV in different variations as “public service” – in the Scandinavian countries, in Germany, in Austria, in Switzerland, and at first also in Italy. Journalism now also meant moving pictures and conveying information visually. In turn, new formats had to be created. This process can be divided into four periods (Bourdon, 2000).

At its beginnings TV news followed the radio model and used film reports like the newsreels. “First of all, mastering technology came before discovering news content” (Bourdon, 2000, p. 63). After overcoming marginality and uncertainty, TV news gained political value. The 1960s “were the golden age of current affairs programs” (Bourdon, 2000, p. 68). Only later, from the 1970s onward, did TV news become a specific genre, more or less presented by an “anchor,” adapted from the US example. Despite corporate control, journalists in public service TV were largely independent and relatively free from the pressure of audience ratings and viewers’ preferences. Newscasts and magazine programs had a serious character and expressed criticism that was not welcomed within the world of politics. This changed in the 1980s when private broadcasting was permitted in Western Europe due to new transmission technologies such as cable and satellite. Many new broadcasting stations financed themselves exclusively with the help of commercials. Their radio and TV programs have to follow audience preferences. This also applied to journalism. The consequences were more “infotainment” and an increasing visual tabloidization of TV news. Bourdon (2000) suggests that this was a “triumph of deregulated television over journalism” (p. 76). Kevin Williams (2005) argues: “The development of European journalism in the twentieth century is portrayed as the gradual demise of the literary and the political form. The Anglo-American model is increasingly dominant in the European media systems, eroding the differences which characterized journalism in these societies” (p. 68).

Although this description may in principle be correct, national journalistic cultures did not simply dissolve everywhere. In some places they still maintain their individual character, e.g., in Greece (Papathanassopoulos, 2001). That is why Williams (2005) also states: “However, there are still sufficient differences to distinguish journalism in Europe” (p. 79; cf. Deuze 2002).

Prospects: Journalism in the Twenty-First Century

At the beginning of the twenty-first century, journalism in Europe (as in other parts of the world) is again undergoing extensive change. Politically, German reunification and the dissolution of the Soviet Union in 1990–1991 meant that in Eastern Europe

formerly federated states became independent, and in general (re)democratization began. This also led to the reform of journalism in those countries (Aumente, Gross, Hiebert, Johnson, & Mills, 1999). Innovations and existing traditions combined in various ways. Publishing houses and broadcasting stations were acquired by Western media enterprises. However, they depend on domestic journalists who must be well informed about their respective countries.

The majority of the former Eastern bloc states have meanwhile become members of the European Union. Today, 27 countries belong to the EU. In this process of European unification, journalism has also acquired new responsibilities. Many expect it to contribute to the development of a European public sphere so that it becomes more than just an agglomeration of national publics.

As well as political causes, technological innovations have also changed journalism over the last two decades. Since the mid-1990s, the Internet has provided a new field of activity for journalists. "Old" media are present in the World Wide Web today. In addition, there are multimedia presentational forms that enable interactive communication. By means of Web 2.0, passive recipients have become active producers of user-generated content. Professional journalism has entered into competition with citizen journalists, especially with bloggers, etc.

Thus, today, European journalism is in a state of flux. Technological developments and innovations in the production and distribution of news have not only changed the profession but are "threatening the privileged status if not the survival of the old professional sort" (Preston, 2008, p. 1).

Journalism History

Korea

Sae-Eun Kim

ABSTRACT

Journalism in Korea has ancient roots in Confucian political ideas. Its modern version is tied to the Japanese colonial period and the US occupation in the mid-twentieth century. In post-independence South Korea, journalism's development has been influenced by its place within the military government and the limitations on freedom of the press that followed. In recent years, a handful of news organizations have dominated mainstream journalism. But strong political and social movements, along with the emergence of digital media and the Internet, have destabilized the journalism system. Korea's journalism is at a crossroads. Despite Korea's particular situation of national division and the authoritarianism of the government, it can be overcome by being faithful to journalistic norms and principles.

Genealogy of Korean Journalism

Confucian political ideas in the Joseon dynasty (1392–1897) described public opinion as the vitality of a nation, although common people had little input. Public opinion was regarded as a critical factor in the management of the nation, and common people were said to be represented by the privileged class *yangban*, or Confucian literati. Local communities of *yangban* were supposed to form public opinion and deliver it to the king; this system might be called the “local public sphere.”

Organs of “expostulation,” or advice to one’s superiors, were also established. I would call this system the “Royal Court public sphere.” Officers in the Royal Court discussed policies and administration and prompted disciplinary measures. These officers for expostulation played the leading role of shaping public opinion in order to check the abuse of the king’s power. Criticism was delivered through three governmental organs: *Saheonbu* (office of discipline, responsible for news coverage of oversight of government officials), *Saganwon* (office of expostulations, responsible for news of ordinary politics), and *Hongmungwan* (office of academy and publicity, responsible for record keeping and providing expert advice to the king). These officials were in principle free from any influence from the king, although this principle was often violated. Modern newspapers can be said to have inherited this spirit of criticism of Confucian literati of the Joseon dynasty.

The Birth of the Daily Newspaper: *Chobo*

If the core function of journalism is to transmit news to the public, *Chobo* (literally, “morning paper”) was definitely an early form of newspaper in the Joseon dynasty. It was the official gazette transcribed by hand at the office in charge of royal commands every morning. It was published in two forms: one for the public in the capital, the other for the provinces. The readers of both were mainly of the *yangban* class. Most of the content was royal decrees. *Chobo* also delivered Confucian lessons, the ruling ideology of the dynasty, news of natural disasters, foreign relations, and extraordinary events, very similar to the content of modern newspapers.

In August 1577, the Royal Court allowed civilians to copy *Chobo* every day to sell to the public. The civilian *Chobo*, printed in type, was distributed to people without access to the official *Chobo* for a subscription fee. When the king was informed a few months later, he prohibited it out of fear of leaking national information to foreign countries. The officials involved in permitting the publication were condemned to exile. Some claim that *Chobo* was the first printed newspaper in the world, as it came before seventeenth-century European journals and 56 years before the 1633 Chinese *Gazette*. *Chobo* changed its title to *Kwanbo* (“official paper”) in 1894.

Origins of the Modern Newspaper

The first modern newspaper in Korea was the *Hanseong Sunbo* in 1883. Initially it was issued every ten days in Chinese characters only; later it came out weekly in a mix of Chinese characters and Korean alphabetic text, or *Hangeul*.¹ In 1896, *Dongnip Shinmun* (*The Independent*), virtually the first private newspaper in Korea, in its inaugural editorial, announced that “we will not discriminate against people according to their social status [. . .] We will not serve only those living in Seoul but all Koreans living in Korea.” This statement aimed at the disintegration of the feudal and closed public sphere of the *yangban* class and heralded the birth of an open and democratic public sphere. With a view to supporting such a public sphere, *Dongnip Shinmun* was issued only in Korean characters so that it could reach more people, regardless of gender and social status. It also published an English-language edition. Several other newspapers followed suit. These newspapers played a significant role in the transition from Confucian traditions to Westernized modernization.

The Long Road to Press Freedom: State Intervention in Journalism

Political power has historically been the most significant influence in the history of journalism in Korea. I shall first trace government policies on journalism and discuss the process of democratization; then I will describe the development of the media as a business or industry in which the Korean government has continued to play an enormously important role.

The development of the press took place within the context of political history. Japanese colonial rule (1910–1945) replaced the Joseon dynasty, ending a period in which foreign powers – including Russia, China, the United States, England, France, Germany, and the Netherlands – had competed for influence. Japanese colonialism tried to eradicate Korean identity. The Korean language was strictly prohibited and even names had to be changed into the Japanese style. The US military government ended Japanese rule and governed Korea for three years. The US occupation banned periodicals supporting the Soviet Union or North Korea.

In 1948, the first government of the Republic of Korea was launched under President Rhee Syngman. Becoming increasingly authoritarian during and after the Korean War (1950–1953), President Rhee Syngman hung on to political power until forced to resign by popular mass demonstrations in 1960. Launched with a cabinet system instead of the presidential system, the second republic (1960–1961) allowed a considerable amount of freedom in politics as well as in the press, but failed to steward the economy and fell to a coup led by General Park Chung-Hee in 1961.

Table 11.1 Modern political history of the Republic of Korea

1910–1945	Japanese occupation
1945–1960	Independence, division, Korean War, and the establishment of the first republic
1960	4.19 (April 19) revolution and overthrow of Rhee Syngman's dictatorship; the second republic under Prime Minister Chang Myoun
1961	5.16 (May 16) military coup d'état and establishment of military regime by Park Chung-Hee
1961–1978	The third and fourth republic of Korea under Park Chung-Hee; people's rights and press freedom extremely limited during dictatorship and industrialization
1979–1980	Assassination of Park, subsequent coup by Chun Doo-Hwan, nationwide resistance against military control and Kwangju Peoples' Uprising
1980–1987	The fifth republic of Korea under Chun Doo-Hwan, the president's term in office amended to seven years and re-election prohibited
1987	10 June Popular Struggle and direct presidential election system
1988–1992	The sixth republic of Korea under Roh Tae-Woo, the president's term in office amended to five years
1991	The three-party merger of one ruling and two opposition parties; Kim Young-Sam, opposition leader for 30 years, becomes leader of the ruling party after the merger
1993–1997	The "Civilian Government," the first elected civilian government under Kim Young-Sam
1998–2002	The "People's Government," the first elected opposition government of Kim Dae-Jung, 32 years' opposition leader in a keen rivalry with Kim Young-Sam
2003–2007	The "Participatory Government"; President Roh Moo-Hyun, successor to the previous president, Kim Dae-Jung
2008–	The "Lee Myung-Bak Government" or "Practical Government"; President Lee Myung-Bak, a conservative politician, former mayor of Seoul

Park held the presidency until he was assassinated in 1979. Chun Doo-Hwan (1980–1988), another military general, took political power by coup; his successor Roh Tae-Woo (1988–1993) was a co-conspirator.

The year 1987 is regarded as a turning point in Korea's political history. Popular mass demonstrations in June forced a constitutional amendment to direct election of the presidency. Korea entered a stage of democratization, even though there was still a long way to go, especially regarding press freedom.

The constitutions of all the republics in Korea, including the most repressive fourth and fifth republics, have endorsed press freedom in principle, if not in practice. Article 21 of the Korean Constitution protects press freedom as a right of citizens: "All citizens shall enjoy freedom of speech and the press, and freedom of assembly and association" (Article 21, Clause 1). It also prohibits press censorship, providing that "Licensing or censorship of speech and the press, and licensing of assembly and association shall not be recognized" (Clause 2). Further, the Constitution stipulates legislation governing the facilities of news services and broadcast media (Clause 3).

Balancing freedom of speech and the press with individual rights to reputation, it states: "Neither speech nor the press shall violate the honor or rights of other persons nor undermine public morals or social ethics. Should speech or the press violate the honor or rights of other persons, claims may be made for the damage resulting therefrom" (Clause 4). However, there is often a gulf between these constitutional guarantees and lived reality. The dictatorships did not allow the people or the press to enjoy freedom of speech.

The first republic (1948–1960) forbade seven news-related behaviors in September 1948: violating the national policies of the Republic of Korea; plotting against the government; approving and/or supporting the Communist Party and the so-called puppet government of North Korea; artificial fabrication and agitating others; obstructing diplomatic relations with friendly nations and damaging national prestige; exerting a bad influence upon public sentiment, not to speak of disturbing and exciting it; leaking the nation's secret information (Song, 1990, pp. 78–79).

The National Security Law promulgated in 1948 was used effectively to regulate the press. The government forced three newspaper companies to discontinue immediately and arrested a large number of journalists, continuing the behavior of the US occupation (Song, 1990, p. 80). Over time, control over the progressive press extended to the conservative press. *Dong-a Ilbo* was discontinued in 1955 and *Kyunghyang Shinmun* cancelled in 1959 (Song, 1990, pp. 118–119). The press was harassed in other ways as well.

The second republic (1960–1962) relaxed the licensing system in the Registration Law of Newspapers and Political Parties in July 1960. A great number of new magazines and news agencies besides newspapers cropped up competitively throughout the country. The number of dailies rose from 41 to 112; weeklies and magazines doubled or tripled (Song, 1990, p. 127).

The military government that followed (1962–1971) immediately proclaimed martial law and began inspecting all publications. It canceled the registration of newspapers and news agencies that had no facilities of their own in the name of "the purification of quasi-journalists and journalistic organs," and announced that no additional licenses would be authorized. The Ministry of Public Information issued standards that resulted in the revoking of licenses for 91% of periodicals and even restricted the number of newspaper pages to 36 per week (Kim, H.-S., 1994, p. 130).

Even as it suppressed press criticism, the government promoted industrialization for media companies and enabled them to accumulate large capital. Policy included material improvement of newspapers, newsprint allocation, frequency allocation, and all sorts of licensing systems and preferential loans to lure newspaper owners. Korean media began their transition to capitalist enterprises by colluding with the political regime, as the dictator needed the media to secure his legitimacy.

In October 1972, the Revitalizing Reform began. The proclamation of emergency martial law included censorship. The Revitalizing Reform Constitution included protections of free speech, press, assembly, and petition in Article 18. However,

Articles 32 and 54 (clause 2) allowed laws to restrict the people's rights and freedoms in the interests of national security and the maintenance of social/national order (Kim, H.-S., 1994, p. 608). Government control was reinforced and criticism in the media was strictly prohibited, but commercial expansion continued. The difference in treatment between owners and reporters rendered Korean journalism obedient to the regime.

The media policy of the fifth republic (1980–1987) was the typical carrot-and-stick: strong intervention in management as well as in reports combined with support for commercialism. The new military government established the Basic Law of the Media, dismissed around 1,000 media workers, restructured media companies, and tightened censorship. The media companies that survived prospered throughout the 1980s. Media workers were exempted from income tax and enjoyed overseas study and training.

Media Policies After Democratization

Press freedom was regarded as an urgent prerequisite for democracy in Korea, especially in the 1970s and 1980s. Struggles for press freedom were the driving force for democratization together with the student movement. But the established press was tame to the point of functioning as propaganda. Reporters who did not agree to play that role experienced hardships and punishments such as dismissal and imprisonment.

Even after democratization, every government and president tried to control the press. Kim Young-Sam (1993–1997) and Kim Dae-Jung (1998–2002) preferred to control the press by conducting tax audits on selected “unfavorable” news media. Roh Moo-Hyun (2003–2007), a former human rights lawyer, encouraged prosecutions to the point where critics called it a war against the conservative press. The number of journalists – reporters and anchors – entering politics increased steadily. The intervention of the government in the appointment of the chair of KBS, MBC, and YTN became increasingly visible. Journalists' self-censorship remained. Freedom of the press in Korea continued to be threatened

However, after 1987 media policy embraced “deregulation.” President Roh Tae-Woo tried to present himself as a “normal (not elitist) and legal (duly elected)” president, different from previous presidents. Meanwhile, strong foreign pressure to open the doors of the domestic media industry promoted the idea of the free market (Kim, N.-S., 1994, pp. 176–178). Media grew rapidly in numbers and profitability during this period, taking advantage of monopolistic or oligopolistic status. Many *chaebol* launched into the media industry (*chaebol-media*), and the other media enterprises developed into large business groups just like *chaebol* (*media-chaebol*). Broadcasting shifted from a public system to a public–private system with the establishment of a new broadcasting company, the Seoul Broadcasting Station, in 1990.

Owing to deregulation, the capitalist market has become another powerful element in Korean media. Movements both within media by media workers and outside the media by civil organizations became essential to keep the media as a public sphere from the influence of the capitalist market, as well as political power, in this new media environment.

The Media Policy of Kim Young-Sam (1993–1997)

Kim Young-Sam's government embraced media reform immediately after his inauguration, emphasizing the social responsibility of the media. The national tax service inspected several media companies and, for the first time, the Fair Trade Commission (FTC) investigated the unfair transactions within the newspaper market (Chu, Kim, & Park, 1997, pp. 278–279). Keen competition in the newspaper market, nurtured by Roh Tae-Woo's government, now entered a new phase. Kim Young-Sam also tried to introduce the Audit Bureau of Circulations system, public disclosure of personal assets of chief executives of major newspapers, the abolition of tax exemptions for media companies' value-added tax and tax benefits to journalists, and restructuring broadcasting companies through the revision of broadcasting law. These reforms were ineffective (Joo-Eon Kim, 2008, pp. 531–532). The tax audit is the most doubtful point. The national tax service inspected several newspaper companies and KBS and MBC, but the results of these audits were not made public, leading people to criticize them as attempts to intimidate journalism (Lee, 1998). Regulation designed to protect small newspapers and promote competition, as well as letting the FTC, the nation's antitrust agency, penalize the newspaper companies, was also controversial. Critics accused the government of trying to suppress the media.

The government also exerted influence through a growing apparatus of public information officers and through intervention in the selection of the leadership of news organizations. It also filed defamation suits against media reports, a clever and intricate strategy of media control (Chung, 1998, pp. 91–94).

The most important agency of press control was the market. The labor movement in the media industries was defeated by competition among media enterprises and journalists' individualism and devotion to press freedom. Meanwhile, the civic media movement began to promote government support, as private media reached the limits of manpower and financial resources (Chung, 2001, pp. 176–178).

Beginning in February 1998, just after the financial crisis in December 1997, Kim Dae-Jung wanted to differentiate his government from previous ones with the title of "People's Government," born out of long struggles for democratization. Despite public hostility toward commercialization in the media, Kim Dae-Jung emphasized the role of the press as "critic with friendship rather than friend without criticism" in his address at the ceremony of "press day" on April 1, 1998, just two months after his inauguration. Making clear that there would be no trial of media control, he

carried out his campaign promise to abolish the Bureau of Public Information. But in May 1999 he revived the Bureau under the name of the Government Information Agency and launched a tax probe of media companies. He also revived the newspaper regulation introduced in 1996 under the Kim Young-Sam government, which had been abolished since it was claimed to be against free market principles. In 2001, tax investigations culminated in the arrests of some newspaper owners, along with fines of about \$4.9 million on 23 media companies. The largest fines were imposed on *Chosun Ilbo*, *Joong-ang Ilbo*, and *Dong-a Ilbo*, the leading conservative dailies, which comprised more than half of the total.

Kim Dae-Jung's media policy in later days was regarded as rather authoritative compared to that of earlier days when he stressed the autonomy of the media. He revised the Broadcasting Law so as to appoint the chairman of KBS (Joo-Eon Kim, 2008, p. 538), which led to controversies and serious conflicts over the appointment that continue to this day.

Setting up the relationship with the press to be a "sound and healthy tension," the "participatory government" of Roh Moo-Hyun tried to break the traditional collusion between politics and the media. The government introduced an open briefing system and revised newspaper regulation to give more support for minor newspapers. Until then, report rooms, from *Cheongwadae*, the Blue House, to local police stations, were exclusively for registered major media companies (most of which were conservative). Minor newspapers and newly launched online media (most of which were progressive), therefore, could not attend briefings. These measures brought about the furious resistance of major media.

The conflict between the government and conservative press was obvious in Roh's presidency. Roh Moo-Hyun paid his first visit to *Hankyoreh* after the presidential election and expressed thanks for supporting him during the election. He also gave the first interview with the online site *OhmyNews*, which was very unusual. He even excluded *Chosun Ilbo* from the list of presidential interviews, the biggest and most powerful conservative newspaper. He considered *Chosun Ilbo* a symbol of the *ancien régime* of Korean society and "a representative anti-democratic privileged group" (Rhyu, 2002, p. 95). Roh's declaration of war with *Chosun Ilbo* was followed by an "anti-*Chosun* movement" of various civil organizations, which soon developed into a nationwide boycott among Roh's supporters.

Diversity of public opinion was the core theme for President Roh Moo-Hyun's media reform. For this, a Special Act on Supporting the Local Press was enacted in 2004 to boost local papers² and the Newspaper Act in 2005 to reform the structure of the newspaper market. According to the Act, the circulation of the top three newspapers must not exceed 60% of market share and the Newspapers Distribution Center was established to provide a nationwide joint distribution system for minor newspapers. The aim of these acts was to lessen the social and political influence of the top three conservative newspapers. However, it was controversial and lapsed with the change of administration.

Commercialization of Journalism

The history of Korean media as a capitalist enterprise goes back to the 1960s under the third republic. With the resumption of Korea–Japan diplomacy in 1965, the government allowed media to use Japanese capital as credit to enlarge their operations with more personnel and new facilities, and their own buildings, and to invest in transportation, which accelerated their development. In 1965, *Joong-ang Ilbo*, by Samsung (the first business group, *chaebol*, in Korea), launched, which meant that newspaper enterprises met the conditions for capitalist development even without direct government subsidy. Advertising in the late 1960s and 1970s became the main source of profit for Korean media.

In the 1980s, media enterprises enhanced their capitalist character as a subsystem of the political system that still lacked legitimacy and therefore needed media to maintain it. Media restructuring in 1980 resulted in monopolistic tendencies and the continued growth of advertising revenue. Media enterprises could modernize their facilities thanks to governmental assistance and increased profits. They launched more varied magazines, and expanded their business fields as cultural enterprises to diversify the sources of profit. Korean media became regimented and aimed to defend and promote the prevailing political powers and policies as well as to pursue the maximization of profits. Their gross sales also increased dramatically. The vigorous advance into the magazine and periodical market in the search for more profits using existing facilities showed the typical attribute of capitalist enterprises. The media enterprises turned out to be a highly profitable business in the 1980s thanks to the various policies of the fifth republic. During the fifth republic from 1980 to 1987, the gross sales of the five major national daily newspaper enterprises increased 3.4 times.³

The revenue composition of the newspaper enterprises has changed drastically during the period under consideration. The percentage ratio of advertisement revenue increased to 60.2% in the 1980s. The non-competitive structure of the media controlled by political power allowed media enterprises to achieve stunning growth in advertising revenue (Kim, 1996, p. 248). Broadcasting and newspapers both grew faster than other manufacturing industries.

Newspaper enterprises owed much of their commercial success to the cartel on subscription fees maintained since the 1960s with the government's connivance. Journalists, too, enjoyed many privileges. The salary level of newspaper reporters, however, was considerably lower compared to the large business enterprises. More than 70% of newspaper reporters received less than the minimum living wage. Some of them had to supplement their salary with support from their news sources in business, public institutes, and politics. News sources volunteered to give money, called *chonji*, to reporters when asking them to conceal their mistakes or to report in favor of them. If these "voluntary offerings" were not sufficient, some reporters

threatened to report their faults or mistakes, something which has been considered as one of the most serious pathologies in Korean society.

Journalists began to organize vigorously in the 1970s. A commitment to democratization of the media and society has been substituted for individualism and loyalty to their own companies. Newspapers increased the number of pages competitively and needed more sensational and entertaining items to attract more readers. When the commercial broadcaster SBS commenced in 1993, all broadcasters competed with more enjoyable and exciting programs to win audiences. Excessive competition for circulation and ratings necessarily resulted in deterioration of news/program quality.

Changing Journalists, Changing Audience

Reporters, struggling in the 1970s for freedom from both government and media ownership, turned to the labor union movement. Conflicts between publishers and reporters were getting as serious as those between the government and the media. In 1974, *Dong-a Ilbo* reporters organized a labor union for the first time among media organizations; ownership responded with mass dismissals of more than 100 participants under the guise of the “rationalization of management.” Reporters at *Chosun Ilbo* protested against the paper’s support of the dictatorship in 1975 and the publisher dismissed the active participants. The dismissed journalists organized protest committees and played a significant role in the free press movement that followed. One of the most important outcomes of their effort was the foundation of *Hankyoreh* (literally, “Korean people,” “one nation,” or “one race”) in 1988, the first legal opposition newspaper in Korea since *Minjok Ilbo*, which shut down after its publisher was executed under martial law in 1961.

Hankyoreh aimed to promote a free and responsible journalism for the restoration of democratic order and reunification. At the advent of *Hankyoreh*, Korean news media were clearly split into conservative and progressive groups. As a progressive newspaper, the reports and opinions of *Hankyoreh* were more critical of political and economic power groups and more protective of social minorities. *Hankyoreh* had a large base among intellectuals and university students, although its circulation was small.

Kim Dae-Jung, elected as president in December 2001, had a long relationship with *Hankyoreh*. Along with the shift in power, conflicts among the media became more complicated and more intertwined with regional conflict between Kyoongsang province and Cholla province, the seedbeds of conservative and progressive political groups, respectively.⁴ The media then became embroiled in partisanship and even factionalism. Alliances among political forces and the media were made and these alliances affected journalism. The top three dailies, *Chosun Ilbo*, *Joong-ang Ilbo*, and *Dong-a Ilbo*, have been organs for the conservative Grand National Party, while *Hankyoreh* and two public broadcasters, KBS and MBC, have been agents for the progressive Democratic Party.

Conflict between public broadcasters and the giant newspapers emerged noticeably in Roh Moo-Hyun's administration. Contention between giant papers and two public broadcasters and between the giant papers and the progressive newspaper *Hankyoreh* helped lead to the impeachment of President Roh in 2004. Korean journalism has lost public trust by fighting a proxy war for politicians. As a result the public sphere fails to operate properly by seeking a consensus on issues and balancing contradictory opinions.

Demystification of Watchdog Journalism: Journalists Running for Political Power

In the era of media politics, journalists have become more influential. Political parties eagerly recruit journalists in election seasons. The term applied to these "politician/journalists" is *polinalist*. In a literal sense, the first president, Rhee Syngman, was also the first polinalist. During the Japanese occupation, many journalists supported the independence movement, and might also be called polinalists.

The mobilization of journalists for publicity began in the military government. To help promote the legitimacy of the government, many journalists were granted the status of National Assembly members and ministers. But it was the "civilian government" of Kim Young-Sam in the early 1990s that brought this practice to its highest level. During his rule, 71 National Assembly members (60 in the ruling party and 11 in the opposition parties), 23 ministers, 5 vice-ministers, and 35 Presidential Officers were former journalists. Since then, the percentages of former journalists in National Assemblies have remained around 10–15%. During the presidential election in 2007, more than 40 journalists joined the election campaign of Lee Myung-Bak⁵ and another 40 applied for nomination by the Grand National Party for the National Assembly.

One could ask whether polinalists could have ever worked fairly and impartially as journalists before running for office. If the answer is no, the profession of journalism for them might be nothing but a stepping stone to political power. Regardless of whether that is true or not, Koreans have come to think of journalists as power-seekers and distrust the media as a result.

Changes of Audience: Decline of Newspaper Readership and Evaluation

Newspaper readership is eroding. The nationwide survey of media audiences in 2010 (KPF, 2010b) revealed a critical situation. Only 52.6% of respondents read newspapers

once or more in a week and the time spent reading newspapers had dropped to 16.1 minutes from 24 minutes in 2008.⁶ Only 29.0% subscribed to newspapers.⁷ The top three newspapers claimed 65.8% of all subscribers: *Chosun Ilbo* 30%, *Joong-ang Ilbo* 20%, and *Dong-a Ilbo* 15.8%.

A steady erosion of trust suggests that newspaper journalism has failed to meet its audience's needs and expectations in a changing environment. The most urgent problems to be corrected in journalism, according to one survey, were collusion with political power (54.3%), irresponsible reporting (44.2%), reporting for the company's own interest (34.3%), and protective reporting for advertisers (25.7%) (KPF, 2010b, p. 28).

Journalism in Digitization: Where to Go?

The power of Internet media became clear when *OhmyNews*, one of the most popular and influential Internet media in Korea, influenced the 2002 presidential election. Launched in 1999 with the slogan "every citizen is a reporter," it invited "all news guerrillas to join us in this grand experiment in globalization." Its news selection and interpretation were completely different from conventional media. "Citizen reporters" with occupations from homeless to professor covered news in their everyday lives not dealt with by conventional journalism, without objectivity and impartiality, but full of factuality and sincerity. Ordinary people challenged collusive journalists through *OhmyNews*, pushed different political agendas, and helped elect Roh Moo-Hyun. As a token of gratitude, Roh Moo-Hyun had his first official interview as president with *OhmyNews*. Low-cost, interactive Internet media have come to compete with conventional journalism media.

The dominance of news services via Internet portals is unique to Korea. Internet portals such as *Naver*, *Daum*, and *Nate* became giants in distribution of news and information, even though they started their news services only in 2003. Portals passed conventional newspapers in trustworthiness in a nationwide audience survey in 2008, with *Naver* and *Daum* ranked at third and fourth as most influential, after only KBS and MBC (KPF, 2008). However, these portals clearly do not perform the same role in the public sphere as legacy media. They do not discriminate among news sources, and much of their content comes from other news organizations; readers selecting an item are portaled into the originating organization's site. Internet news also encourages sensational headlines to grab reader attention.

The new Newspaper Act, passed by the ruling party in July 2009, includes Internet portals as news services. It also abolishes restrictions on cross-ownership and cross-operation of different media, making it easier for a *chaebol* to own and control news organizations (KPF, 2010a, pp. 99–100). The new Act has been divisive, especially in relaxing cross-ownership and cross-operation regulation. Those in favor argued that deregulation was needed for news organizations to survive globalization and

digitization; those opposed thought that it would increase the influence of the conservative newspapers at the expense of diversity of public opinion. Around the same time, the Korean Communications Committee (KCC) picked four consortia, led respectively by *Chosun Ilbo*, *Joong-ang Ilbo*, *Dong-a Ilbo*, and *Maeil Kyungje* (the largest economic daily in Korea), all leading pro-government conservative newspapers, to the strong criticism of the opposition.

History of Journalism Studies in Korea

The Joseon Institute for Journalism Education opened in 1947, two years after the liberation from Japanese colonial rule. The institutionalization of communication studies in Korea began when Hongik University became the first Korean university to open a communication department in 1954. It merged in 1962 with the second communication department in Chung-ang University (founded in 1958) (Yang, 2009b, p. 71). Communication departments and research institutes mushroomed in the 1960s. Seoul National University founded its Institute of Journalism Research in 1963 and opened a Graduate School of Journalism. Journalism, and especially print journalism, dominated Korea's communication research (Yang, 2009b, p. 71).

As the new generation of professors who studied in the United States began to teach at Korean universities from the late 1960s onward, the emphasis shifted from normative journalism studies to communication research as a social science. In 1973, 67% of the professors teaching in communication departments had studied in the United States, and most of them accepted the empirical paradigm. In top universities the figure was 89% (Yang, 2005). Communication studies spread to major provincial universities in the 1980s. Growth continued in the 1990s, as the number of departments increased from 15 in the early 1980s to 126 in 2009 (Yang, 2009b, p. 72). This number is second only to the United States.

Academic societies and journals also appeared. The Korean Society for Journalism Studies (KSJS) was established in 1959. KSJS aimed to "promote researches on journalism, collaboration and friendship among the members," and added "mass communication" to its name in 1969. Finally, it changed "mass communication" to "communication" in 1977. A host of more specialized societies appeared in the 1980s and 1990s. The number of KSJCS members grew from 30 in 1959 to more than 1,000 at present (Yang, 2009b, p. 73) and KSJCS has 20 research divisions including journalism.

KSJS published its official journal, the *Korean Journal of Journalism Studies*, in 1960 (though it didn't publish its second issue until 1969). It changed its title to the *Korean Journal of Journalism and Communication Studies* in 1992 and has steadily increased its publication frequency to six issues per year (Cha & Lee, 2009, pp. 321, 322, 328). In quantity, Korean journalism studies rivals those of other countries; in quality, it has successfully followed the path established by the United States (Yang, 2009b; Im, 2009, p. 437).

US-trained scholars imported the style of communication studies into journalism schools, especially empirical methods (Yang, 2009b; Im, 2009, p. 438). Content analysis was the most popular research method in Korea's early journalism studies. Nearly half of MA theses at Seoul National University in the 1970s used content analysis. A few others used survey, experimental, or Q methodologies on news audience and news production. But there was little methodological reflection or innovation in these studies, and there were hardly any mid-scale or large-scale theories (Im, 2009, pp. 437–441).

The advent of critical communication studies in Korea was directly related to the political situation of the 1980s. After the June Uprisings in 1987, radical ideologies and social movements spread and affected journalism studies. The basic idea of the critical macroscopic approach in that period came from the recognition that journalism as a social institution is deeply intertwined with other social systems. Critical studies and its challenge to functionalism reflected the anti-US sentiment which swept the universities in the 1980s. Im (2009, pp. 444–445) points to reflective research into the relation between news and reality, critical normative studies, and the deployment of concepts like ideology, representation, myth, discourse, and articulation. More attention was paid to the political character of news and its role in maintaining the status quo. Under the influence of political economy and British cultural studies, the political purpose and ideological effect of news were discussed in Korea's historical and social context. In the late 1980s, a fierce theoretical and ideological confrontation between empirical mainstream research and critical studies in Korea's communication circles produced what Yang (2009b, p. 76) calls a "paradigm dialogue" marking the birth of diversity or pluralism in the field. However, as Im (2009) regretfully acknowledges, critical journalism studies can be criticized for lacking theoretical precision and arbitrary use of terms. But, I argue, the most important problem of critical journalism studies since the 1980s is its alignment with factional journalism, whether conservative or progressive.

Pluralism is the key word to describe journalism studies since the 1990s (Yang, 2009a; Im, 2009). New and old research tendencies coexisted, competed, and developed with various research issues, approaches, and methodologies. Im (2009, p. 446) describes those changes as follows: content analysis and audience research were still major areas in journalism studies; news production research was augmented with qualitative methodologies such as participant observation; traditional empirical approaches were also enlarged from content analysis and survey to advanced statistics such as network analysis; qualitative methodologies such as discourse analysis, participant observation, and semiology became frequently used in journalism studies.

The number of journal articles increased steadily thanks to the evaluation system of the universities focusing simply on the quantity of publication. Nonetheless, Korean journalism studies is still struggling for its identity. Systematic theoretical work remains a weak point (Im, 2009, pp. 447–449). Yang's (2009b, p. 77) content analysis of the research paradigms of articles published in three major journals shows the number of critical studies increasing significantly in the 1990s, but still well behind the empirical paradigm (see also Yang, 2009a, p. 1031).

Key Issues in Journalism Studies in the 2000s

On March 12, 2004, the opposition-led National Assembly passed the impeachment of President Roh Moo-Hyun to suspend his presidency. The impeachment of President Roh, who was thought of as progressive, was a shocking event to almost every Korean, and was the focus of news coverage across the political spectrum. Controversy arose over the impartiality of coverage by the broadcast networks, and pressure was brought to bear on them by the conservative opposition. In response, the KCC turned to the academy for an assessment, asking the Korean Society for Journalism and Communication Studies to study the matter. They assembled a team of six professors, who did a multi-method content analysis using empirical content analysis, frame analysis, and discourse analysis (KSJCS, 2004, p. 7). They found that “The entire frame (of the programs) was formed by portraying the forces opposing the impeachment as the weaker group and those supporting the impeachment as the stronger and unjust ones” and concluded that “those programs can hardly be seen as fair and impartial, no matter how loosely principles are applied” (KSJCS, 2004, p. 166). This conclusion, in turn, provoked another sharp dispute on the “fairness” of the KSJCS report itself. Conservative media and scholars welcomed the report, while progressive media and scholars criticized the report, the research team, and the executives of the KSJCS. The KSJCS remains divided on this issue.

The sociology of news remains underdeveloped in Korea, partly due to the resistance of the tight-knit circle of Korean journalists. They do not welcome researchers, on the pretext of being busy. They express an authoritarian elitism with deep roots in the Confucian tradition. Indeed, the examination for journalists to work for major newspapers and broadcasters is getting so difficult to pass that it is compared to the bar exam. Aspiring journalists normally have to spend several years after graduation passing these exams. Fear of disclosure of errors and wrongdoing to the public is also an obstacle for researchers. Therefore, any issues related to journalists’ professionalism and ethics remain difficult to explore.

Rethinking Press Freedom in Korea

According to KPF’s biennial survey, Korean journalists have evaluated the degree of freedom in selecting and writing news as “somewhat free,” except for 1995 when President Kim Young-Sam pushed the tax probe investigation (KPF, 2009, p. 198). For the last ten years, the most frequent answer for the factor most limiting press freedom was advertiser pressure. The perceived influence of publishers and of editors has also increased. From 1999 to 2003, governmental/political power was next to advertisers and publishers. However, the influence of editors passed governmental/political

power in 2003. In 2009 governmental/political power surpassed the editorial office and the owner/publisher (KPF, 2009, pp. 199–200).

Similarly, Korea's press freedom seen from outside Korea is decreasing. The Reporters Sans Frontières' annual Press Freedom Index (PFI: <http://en.rsf.org/>) shows that the situation has been getting worse since 2007, the last year of Roh Moo-Hyun's administration, and into Lee Myung-Bak's government. Freedom House downgraded Korea from "free" to "partly free," ranking it 70th among 196 countries (<http://freedomhouse.org/images/File/fop/2011/FOTP2011GlobalRegionalTables.pdf/>). Increased censorship and attempts to exert official influence over the management of broadcast outlets led to a decline (Karlekar, 2011, p. 2).

Korea's journalism is at a crossroads. Some say that it is unavoidable because of Korea's particular situation of national division. However, I would argue that it springs from the Confucian tradition embedded in the authoritarianism of the government. It can be overcome by being faithful to journalistic norms and principles.

NOTES

Some parts of this chapter are based on the author's PhD thesis, *Communication, Culture and the Korean Public Sphere* (2001, University of Sussex, UK).

- 1 Through the newspaper, *Hangeul*, which had been used mainly in private letters exchanged between women and in storybooks read by women in their inner rooms, was used to treat important public affairs of the nation for the first time since the fifteenth century. Newspapers as modern commercial media were critical agents of social change.
- 2 The Korean newspaper market is dominated by national dailies, especially by the top three dailies. The newspaper market share in 2010 was: national dailies 63.5%, local dailies 9.9%, and financial dailies 20.6%. The combined share of the top three national dailies is 43%: 16.7% (*Chosun Ilbo*), 13.6% (*Joong-ang Ilbo*), and 12.7% (*Dong-a Ilbo*), respectively. Source: <http://www.media21.or.kr/solution/bbs/smBoard.asp?bGroup=2&bid=da01&mode=view&idx=157>
- 3 The circulation income of *Chosun Ilbo* in 1979 was less than 10,000 million Won, which increased to 52,600 million Won in 1986. Capitalization of *Dong-a Ilbo*, *Hankook Ilbo*, and *Seoul Shinmun* increased nearly seven times from 1980 to 1987, whilst the capital of manufacturing industry increased by 38.2% in the same period (*Media Oneul*, February 7, 1996).
- 4 All the presidents since the 1960s, Park Chung-Hee, Chun Doo-Hwan, Roh Tae-Woo, and Kim Young-Sam, were from Kyoungsang province, while Kim Dae-Jung was from Cholla province.
- 5 These polinalists were appointed after the election as the chairmen of media companies under governmental influence and media-related institutions.
- 6 The daily amount of time for using news and current affairs was 86.9 minutes, including television (41.2 mins.), radio (5.4 mins.), and the Internet (13.9 mins.), which was 28.8% of total media use (301.4 mins.) (KPF, 2010b, p. 15).
- 7 Newspaper subscription rates have dropped continuously: 36.8% in 2008, 40% in 2006, 48.3% in 2004, 52.9% in 2002, 59.8% in 2000, 64.5% in 1998, and 69.3% in 1996 (KPF, 2010b, p. 19).

Journalism History

China

Shihua Chen and Qian Wang

ABSTRACT

China has a long history but a relatively short journalism history. Before the nineteenth century, most ancient information media only circulated within bureaucracies in order to maintain the ruling class. Modern journalism started in the early nineteenth century. The first Chinese newspapers and magazines were set up by missionaries to preach religion, mainly in the Southeast. From the middle of the nineteenth century, Chinese media established by Chinese intellectuals emerged and advanced the reforms of the Ch'ing dynasty and social modernization, finally leading to the collapse of the old regime. In the first half of the twentieth century, journalism was used by different political forces. Media became party organs to facilitate revolution and seize power in the conflict between the KMT and the CCP. After the foundation of the PRC, journalism was mainly the mouthpiece of the CCP; no commercial media existed until the 1980s. Afterward, journalism shifted emphasis from propaganda to economic reporting; commercial media emerged and succeeded in the market economy; and newspaper groups, broadcasting groups, and the Internet developed quickly. But party control still exists. Journalism in China still has to fight to survive under the double pressure of market and party.

Prehistory of Journalism in Ancient China

China is a very ancient country and has experienced a different kind of media history compared to other nations. Its earliest newspaper can be traced back to the Tang dynasty. Before that, there were no special news media; news was communicated mingled with other information.

The first newspapers, named *Zhuangbao* or *Dibao*, were about court news; they were first produced spontaneously by *Jinzouyuan*, a governmental agency set up in Chang'an where the emperor lived, and served the *Jiedushi*, provincial governors in charge of civil and military affairs. Such newspapers were government organs aimed at magistrates and officials, produced and circulated only among the bureaucracy (Bin, 1999).

Called variously *Jinzouyuanzhuang*, *Baozhuang*, *Chaobao*, or *Dibao* in ancient China, today people refer to all of them by the name *Dibao*. These ancient newspapers differed dramatically from modern newspapers. First, the content is quite different: *Dibao* are all about the emperor's orders, officials' memorials to the throne, and announcements of official promotions, demotions, rewards, and punishment. Second, the form is quite different: the *Dibao* was full of information without any fixed form. Handwritten on silk or paper or printed on paper, it didn't have any columns, headlines, or divisions of information. Third, the circulation and distribution were very different. Instead of being published and circulated by a newspaper office, the *Dibao* was issued by the court and government and distributed through the post. There was no independent profession of journalism.

This was true of the Han, Tang, Song, Ming, and Early-mid Ch'ing dynasties. During the Song dynasty, the *Dibao* became a centrally managed organ, strictly supervised by authority, which limited its content and weakened its timeliness. These limitations left an opening for the development of the *Xiaobao*, unofficial and uncensored newspapers whose news was chosen and disseminated according to the needs of the communicators. Though banned by the government, *Xiaobao*'s timeliness and news appeal allowed it to survive. *Dibao* grew more abundant in content during the Ming dynasty, and began to report news about agriculture, the climate, and society (Yungong, 1990).

With the development of the economy and society, non-governmental newspaper houses in Beijing publicly issued *Jingbao* in the Ch'ing dynasty. News in those newspapers also came from the court; they reported news that the *Dibao* neglected. The *Jingbao* were full-fledged newspapers, aiming to satisfy people's need for news at that time.

The Nineteenth-Century Rise of a Modern Press in Late Ch'ing China

Limited by the feudal economy, China's ancient *Dibao* developed very slowly in both form and content. Things changed with the outbreak of the Opium Wars

(1840–1842), which brought an end to China's closed-door policy. The 1,200-year history of the ancient newspapers also ended; they gradually disappeared, replaced by modern newspapers.

The Western capitalist powers, especially Britain, were busy enlarging commercial markets and accelerating colonial expansion in the nineteenth century. Aiming to grab the huge market in China, groups of businessmen, missionaries, politicians, and adventurers came, bringing opium as well as other varieties of goods, like Western-style hospitals, schools, and newspapers.

The old agrarian–bureaucratic imperial China was no match for the expanding British and other empires of international trade and gunboats. Thus the Opium Wars became a watershed of Chinese history which rapidly caused the unified feudal empire to evolve into a semi-feudal and semi-colonial state. The development of foreign newspapers in China was divided into two phases by the period of the Opium Wars.

Before the Opium Wars, Western religion and newspapers were strictly forbidden by the Ch'ing government. Covert publications appeared in the coastal areas, however. These included the *Chinese Monthly Magazine* (*chashisu meiyue tongji zhuan*) and the *Eastern Western Monthly Magazine* (*dongxi yangkao meiyue tongji zhuan*). There were six Chinese-language newspapers and 11 foreign-language newspapers, including the Portuguese *A Abelha da China* (*mifeng huabao*) and English *Canton Register* (*guangzhou jilubao*). Foreign missionaries published Chinese-language newspapers for Chinese readers. Foreign-language newspapers' readers were foreigners, and most of their content was news and business reports.

The first Chinese-language newspaper was the *Chinese Monthly Magazine* (1815–1821), which was printed using carved woodblocks and published monthly by the British missionary Robert Morrison and William Milne at Malacca, which is very near China. This newspaper's fundamental task was the elucidation of Christian doctrines; it also tried to propagate ethics and morals and offer information about other countries and knowledge of astronomy and geography. And it published some poetry and fables. Morrison and Milne were attentive to their craft. To make their message more effective, they chose easily accepted Chinese traditional forms and worked hard to make their articles short and popular.

The *Eastern Western Monthly Magazine* (1833–1838) was another foreign religious Chinese-language newspaper. Published in Guangdong, it was the first modern Chinese-language newspaper produced in mainland China. It focused on current affairs, business, and politics. At the same time, foreign businessmen and politicians published the first group of foreign-language newspapers, which also saw themselves as protecting the rights of foreign businessmen and adventurers. The earliest published English newspaper was the *Canton Register* in Guangzhou.

After the Chinese defeat in the Opium Wars, the Ch'ing government was forced to open its borders to Western powers and grant missionaries the right to proselytize openly throughout China (Twitchett & Fairband, 1978). Foreign newspapers expanded, spreading from Hong Kong, Guangdong, and Macao to many other areas of China. A web of foreign newspapers appeared, about 300 in all, and more than

200 of them published after the Wars. Important newspapers included the *Shanghai Serial* (1857), the *Chinese Globe Magazine* (1868), *Shenbao* (1872), and the *North China Daily News* (1882).

The foreign newspapers had significant influence on the development of modern society in China. First, they reinforced cultural colonialism. Second, they promoted communication between China and the West. Third, the practice of foreign-owned newspapers contributed to the development of Chinese publishing experience, skills, and printing techniques. Chinese journalists like Wangtao and Chen Aiting were employed at foreign-owned newspapers and then became leaders of a new generation of Chinese journalists.

After contact with a Western newspaper, Chinese people became familiar with it and began to use it. Two groups, officials and businessmen, gathered information from it to learn the trends in politics, military affairs, and business. Others, like Chen Aiting, worked for Western newspapers writing articles for the Chinese; they went on to edit Chinese-language newspapers. The Chinese didn't publish their own modern newspapers until social innovation from inner China came into contact with foreigners in Hong Kong, Shanghai, and elsewhere in the 1870s. *Xunhuan Ribao* (1874), one of the most successful Chinese-owned newspapers, was also one of the earliest newspapers openly advocating political reform. It was founded and its first editorial was written by Wangtao, an early bourgeois reformist thinker. His columns were terse and forceful and took clear-cut stands. Filled with feeling, they explained profound theories in simple language; their style greatly influenced writers at that time and continued to inspire reformers afterward.

The tempo of foreign invasion steadily accelerated. The Opium Wars of 1840–1842 were followed within 15 years by the Anglo-French invasion of 1857–1860, then within another decade or so by Russia's occupation of Yili in 1871 and Japan's takeover of Liu-ch'iu in 1874, and the next decade by the Sino-French War of 1883–1885. Nine years later in 1894–1895 came the crushing Japanese victory over China (Twitchett & Fairband, 1978). China was forced to sign unfair treaties and to surrender sovereign rights under humiliating terms. Then the Reform movement, launched by Chinese bourgeois reformists, swept across China in the mid-1890s, encouraging Chinese-owned newspapers to develop rapidly. About 80% of 120 Chinese-language newspapers were Chinese owned, among which the bourgeois reformists and their related non-governmental bodies engaged the most and with the greatest influence. Kang Youwei, Liang Qichao, Yanfu, and their newspapers played positive roles during this period.

During the Reform movement, newspapers aimed to reach the upper ruling class and gain their sympathy and support. In the period from August 1895 to August 1896, *Zhongwai jiwen* and *Qiangxue bao* were representative. The newspaper became a vital tool to organize, lead, and guide the campaign during August 1896–August 1898. *Shiwu bao* (*China Progress*) in Shanghai, *Guowen bao* (*National News*) in Tianjin, and *Xiangxuebao* and *Xiangbao* in Changsha all played significant roles during the campaign. Liang Qichao deserves special attention.

Liang Qichao (1873–1929) has been widely recognized as the most prominent journalist in the late Qing period. His involvement in journalism lasted altogether 27 years: he was editor in chief of ten newspapers and associated with at least another 19 newspapers throughout his life. Liang created a new journalism style which revolutionized the Chinese press. Liang's effort in establishing normative press theory is also well known. From 1895 to 1911, he published about a dozen essays in *Shiwu bao*, *Qingyi bao* (*China Discussion*), *Xinmin congbao* (*New Citizen Journal*), and other newspapers, writing at length on the importance of modern journalism. His works have been widely quoted and celebrated by Chinese journalists and historians of journalism as a breakthrough in modern Chinese journalism. Liang established a theory of the public and public opinion. He suggested a normative model of journalism as political at heart and public in character and placed the press in a central position in the development of civil society and modern political discourse. He mainly envisioned journalism as part of a middle realm between the common people below and the officials above, thus serving as a contemporary political authority replacing the old imperial court (Zhang Volz, 2009).

Following the upsurge of reform newspapers, a new style of government organ came into being, published by the Ch'ing dynasty in an attempt to save the decaying regime. A network of over 100 newspapers throughout the country formed a system that included both central and local organs. This news network seems to have temporarily delayed the collapse of the Ch'ing dynasty.

1900–1949: Journalism for Revolution

The Chinese political situation changed dramatically after the Hundred Days Reform in 1898. The national bourgeois class divided into two different factions, bourgeois reformists and bourgeois revolutionaries. They launched the Reform movement and the Revolution movement, respectively. The former was represented by Kang Youwei and Liang Qichao, who promoted moderate reform aimed at a constitutional monarchy; they vehemently opposed the bourgeois revolutionary goal of democratic revolution. Sun Yat-Sen led the revolutionaries, whose strength grew after 1900. They hoped to violently overthrow the feudal system and the Ch'ing dynasty. During the Revolution of 1911, they published numerous newspapers and periodicals to propagate and serve the revolution. Both sides published partisan newspapers.

Reformist newspapers went on to develop in China and abroad after the Xinyou Coup. *Qingyi bao* and *Xinmin Congbao* were influential newspapers published in Japan. *Shibao* was the most famous newspaper after 1903, when the bourgeois reformist newspaper revived in China. Some bourgeois reformists were radicalized after the Eight-Power Allied Forces invaded Beijing and the Boxer Rebellion failed.

As the revolutionaries developed, their party's newspapers and periodicals grew briskly. The activities of the bourgeois revolutionary newspaper can be divided into

three phases. The first phase was from 1900 to 1904, during which the bourgeois revolutionary newspaper was published by students abroad and exiles in Japan. *Zhongguo ribao* (1900), the first revolutionary organ in Hong Kong, and *Subao*, the earliest newspaper controlled by revolutionaries in China, were representative. The Chinese Education Society, the Patriotic Society, the Restoration Society, the Society for the Revival of China, etc., had published a group of revolutionary newspapers in China, which included *Guomin ribao*, *Jingzhong ribao*, and *Zhongguo baihuaba*. The second phase was from 1905 to 1907, during which *Minbao* (1905), the official organ of the United League, the bourgeois revolutionary united party, was representative. *Minbao* propagated the ideas and theory of the revolution. On the other hand, it debated with the Royalist Council newspapers to good effect. The third phase was from 1908 to 1911, during which a group of revolutionary newspapers referred to collectively as Vertical Sanmin appeared and developed significantly – *Minhu ribao*, *Minyu ribao*, *Minlibao*, and *Dajiangbao* published by Yu Youren were representative. According to the needs of the revolution, the newspapers' propaganda focus changed from abroad to back home and performed an indispensable function in the final struggle of overthrowing the feudal rulers.

Journalism took off after the Ch'ing dynasty eliminated newspaper censorship in 1901. News reporting was the main content: political, economic, and social news became prevalent, often in-depth, supplemented by photographs and other design features, and often put together by specially appointed and accredited journalists. As the political situation developed and the influence of Western newspapers increased, the forms of news also increased – editorials, review comments, editors' notes, and so forth were adopted. Some newspapers were divided into serious and satirical sections, and literary supplements grew in importance. Advertisements became more important, and more attention was paid to design. Newspapers became more differentiated from periodicals, evolving into their present forms.

Sun Yat-Sen instituted a system of freedom of the press immediately after the Provisional Government of the Republic of China was set up in 1912. This provided a huge impulse for the development of journalism in China. The following six months came to be called the Golden Age of the Press; newspapers around the country surged from 100 to 500, with a total circulation of 42 million (Tingjun, 2008, p. 131). Among the newly published newspapers, most were political party newspapers. More than 300 political parties appeared after the government was set up, but they quickly combined and divided into two grand party coalitions, the United League–Kuomintang (KMT) and the Republican Party–Progressive Party. The various parties founded organs to promote their election campaigns and to counter their opponents' newspapers.

Soon, though, Yuan Shih-kai gained control of press regulation and put an end to this period. His centralized authority targeted the press, closed down newspaper houses, and arrested, expelled, and killed newspapermen. Newspapers decreased to 139 from 500 in the course of 1912, in a moment that came to be known as the Guichou Disaster. After Yuan Shih-kai died in 1919, the political situation

degenerated into turbulent chaos under the rule of the Northern Warlords (1912–1927). Journalism changed in complex ways, with notable innovations like the popular Mandarin Duck and Butterfly School art supplements, and controversies over “yellow” tabloids.

Some encouraging developments occurred during this frustrating time. Because political comment was forbidden by the government, newspapers paid more attention to news reporting. The emphasis on news in newspapers became larger than ever, and many newspaper houses spared no expense to employ talented, experienced journalists; they even sent their journalists abroad to report the international news. The other important phenomenon in the early Republic of China was the development of news agencies, set up with the support of bureaucrats and businessmen. Most prominent among them was Shao Piaoping, who set up the successful Tokyo agency.

A number of elite journalists, distinguished by education, experience, and a reputation for high standards of journalism, appeared at this time, including Huang Yuansheng, Shao Piaoping, Liu Shaoshao, Lin Baishui, Hu Zhengzhi, and others. Huang Yuansheng was the preeminent journalist, credited with shaping the style of the news report (Wu, 1994). He published and edited the weekly *Shaonian Zhoukan* (*Youth Weekly*), then worked as a special correspondent stationed at Beijing for *Shibao*, *Shenbao*, and *Dongfang Ribao*, and often wrote for many other leading newspapers. Shao Piaoping, another well-known journalist, was famous for his skill at interviewing. These elite journalists enhanced the social standing of the profession.

Reacting against Yuan Shih-kai's autocratic reign and the sense of danger of national subjugation, radical intellectuals led by Chen Tu-hsiu and Li Dazhao promoted Citizenship Reform, arguing that, in order to realize democratic politics, it was necessary to use bourgeois–democratic ideology to arouse the people. The magazine *New Youth* (*Xin Qingnian*) was founded in Shanghai under the editorship of Chen Tu-hsiu in September 1915. It drew together ideas which formed a third stage of the reform movement that began in the 1890s. *New Youth* did not begin in 1915 with a straightforward affirmation of this optimistic philosophy of progress. Rather, at first, it was a vehicle for radical intellectuals anxious to counteract what they saw as retrogressive forces in politics and culture which were growing stronger as the experiment in republicanism faltered under the presidency of Yuan Shih-kai, and then fell hostage to contending militarists after his death. By 1920 Chen Tu-hsiu and his close collaborator on *New Youth*, Li Dazhao, announced their conversion to Marxism and turned the magazine into a vehicle for the new Chinese communist movement. During the May Fourth movement, which followed China's betrayal at the Versailles peace conference, many newspapers' supplements abandoned their previous commercial strategies to embrace new ideas, new knowledge, and new art. Some of them turned to Marxism. Newspapers were also buoyed by more and better advertisements during that time. And journalism education and research began, with Xu

Baohuang and Shao Piaoping contributing much to that project. Some universities established the curriculum of journalism in the 1920s.

The Chinese Communist Party (CCP) was founded in 1921. The CCP produced newspapers and periodicals for workers, peasants, women, youth, and the army; they inaugurated what became the party newspaper network. Meanwhile, progressive newspapers and revolutionary journalists were suppressed in the areas controlled by the northern warlords. Prominent newspapermen Shao Piaoping and Lin Baishui were murdered by minions of the northern warlords in Beijing, to the shock of the country. As a whole, the news media's social influence grew, spreading beyond the circle of politics and academics into the general public and playing a positive role in the workers' movement, peasant movement, united patriotic movement, and the Northern Expedition.

After a period of cooperation, the right wing of the Kuomintang (KMT)/National Party turned against the CCP, boycotting the revolutionary newspapers. The counter-revolutionary coup launched by Chiang Kai-shek and Wang Jingwei in 1927 seriously weakened left-wing journalism.

The ten-year civil war between the KMT and CCP that followed (1927–1937) was also a war between competing camps of journalism. The KMT led by Chiang Kai-shek established the *Central News Agency*, which anchored a large news communication network that included the *Zhongyang Ribao* (*Central Daily*) and *Saodang Bao* (*Sweeping Daily*) and a broadcasting network revolving around *Central Broadcasting*. The KMT also controlled many privately owned news organizations. The KMT regulated the press and targeted CCP media in particular. In the KMT-controlled areas, the CCP published newspapers secretly, with the active center still in Shanghai, where Lu Xun was the best-known journalist. The CCP and its Red Army controlled the Revolutionary Base Areas, and there operated a competing newspaper and communication network, which was instrumental in the building of the regime, and included the *Red China News Agency*, the *Red China* newspaper, and the *Red Star Newspaper*.

After the September 18 Incident, in which Japan engineered an explosion near a Japanese-owned railroad to justify an invasion of Manchuria, CCP media proclaimed a goal of national salvation. Most prominent among the journalists was Shi Liangcai. A dramatic change also occurred in the newspaper *Shen Bao* (*Shun Pao*), which switched from ineffectual mild comment to full-throated criticism. *Shen Bao*'s progressive articles had a great social impact. Shi Liangcai, who had become recognized as the voice of independent public opinion, was assassinated by a KMT spy in 1934. Zou Taofen, another outstanding activist journalist, published *Shenghuo* (*Life Weekly*); his work still greatly influences journalism today. Fan Changjiang's book-length report, *The Northwest Corner of China*, became a bestseller, and American journalist Edgar Parks Snow's *Red Star Over China* also told the story of the Red Army. The former was the first timely objective report of the Long March and its influence, the latter was an earlier book which publicly introduced the CCP revolution and its

leaders. Snow's book had tremendous impact worldwide and gained understanding and support for the Chinese struggle. Meanwhile, in the field of journalism research, Ge Gongzhen's *History of the Chinese Newspaper* (1927) laid a solid foundation for Chinese journalism history.

When the Marco Polo Bridge incident on July 7, 1937, led to full-scale war between China and Japan, it also unleashed a crescendo of journalistic activities. An unprecedented unity in the face of Japanese aggression replaced the factionalism of the early 1930s. Journalists were national patriots. Following its political headquarters, the center of KMT journalism moved from Shanghai to Wuhan and then to Chongqing. A Chongqing-centered journalism network was established and developed well despite the moves and disruption, so that the total number of newspapers actually increased during the war. But as the war developed into stalemate, KMT newspapers lessened their anti-Japanese passion and strengthened their anti-CCP activity. As the CCP's revolutionary base area enlarged, its central organ, *Liberation Daily*, expanded in influence. At the same time the CCP created a group of legal news organizations in districts under KMT control, among which *Xinhua Daily* and *Mass Weekly* had the broadest reach. Most of the privately owned newspapers dedicated themselves to national integrity, a good example being *Dagong Bao* (*Takung Pao*). From November 1937 to December 1942, Shanghai was a concession of Britain, the United States, and France, and was surrounded by Japanese-occupied zones. A number of privately owned anti-Japanese newspapers published there, the most famous being *Wen Hui Daily*. In the Japanese occupied areas, a small group of progressive anti-Japanese newspapers were published at great risk.

After eight years of war, Japan unconditionally surrendered and withdrew from China in August 1945. The force of the CCP army grew, entering a full-scale civil war with the KMT. The journalism of the two parties can be divided into three phases as the military situation developed.

From September 1945 to June 1946, before the full-scale civil war broke out, the two parties' journalism competed fiercely; both established newspapers in the liberated areas. From June 1946 to July 1947, the CCP was on the defensive, and their news operations struggled, while KMT journalism developed to its peak. In the last phase, as the CCP succeeded militarily, KMT journalism collapsed in mainland China. The center of the CCP media system moved from the countryside to the cities. Privately owned newspapers changed their stand gradually to align with the CCP. Hence journalism developed into an entirely new pattern in China.

1949–1978: Journalism as the Party's Mouthpiece

Within a few years of the founding of the People's Republic of China, reforms of the press system turned privately owned journalism into publicly owned journalism. The PRC constructed a newspaper system led by the CCP's *People's Daily*, the

Xinhua News Agency, and China National Radio. Photojournalism, newsreels, and journalism education continued to develop. The General Administration of Press and Publication was set up in 1949; it led and managed the whole country's news system. During the seven-year "socialist transformation," economic news was the major content of the press. The press also dedicated itself to demonstrating the new image of China. Reports on the War to Resist US Aggression and Aid Korea were also major political news. In cultural reporting, the media also achieved success, although some serious problems emerged. The CCP and Mao Zedong (Mao Tse-tung) used the techniques of partisan journalism to launch a much-expanded discussion and critique of cultural academics. The imitation of the dogmatism of the Soviet Union's journalism also presented a problem. The press became divorced from Chinese reality, which limited its supervisory function. Under the cultural development policy of the "Double Hundred," the Chinese press learned from these lessons and carried out a socialist reform which began from the revision of *China Daily*, then expanded to other media in 1956, producing rapid improvement.

However, during the painstaking exploration of building socialism from 1957 to the first half of 1966, the media inflicted one tragedy after another in responding to Left political movements. Trying to cater to the needs of the movements, it lost its capacity for independent thinking and judgment, promoting ideas that harmed both the party and the people on a huge scale; journalism itself suffered in the process. The years from 1958 to 1965 were a period of major transition in the Chinese revolution. The press became a tool in the anti-Right struggle, and many newspapermen were also identified as belonging to the Right in 1957. During the Great Leap Forward in 1958, journalism did not report objectively, but conveyed arbitrary and impracticable directions on social construction. The press lost its sense of social responsibility. Then, from the second half of 1960 to the first half of 1962, the press adjusted itself, drew lessons from the past, and performed according to journalistic values. Two years later, the press was forced by the top leader to report the class struggle and anti-revisionism as the Chinese revolution entered a new stage in 1966.

Today it is acknowledged that the top leader, Mao Zedong, wrongly evaluated the Chinese situation. In Mao's competition with inner-party leaders, Liu Shao-chi and some other party leaders became the key initial targets of the Cultural Revolution. Groups of workers and students joined in, believing in the need to struggle against any bourgeois enemy. Many innocent people were persecuted. The movement launched China into a decade of tumult, during which the press became a tool of the counter-revolutionary groups. Media controlled the representation of public opinion, and all the media reported the same content. Journalists left their jobs in droves, and the quality and quantity of formal newspapers declined, while a rapidly increasing tabloid press flooded the nation (Hanqi, 1999). Journalism research and education during that time was also in a state of paralysis. The entire journalism system lost the trust of the people. China woke up from the terrible nightmare when the Gang of Four fell in 1976.

After 1978: Journalism Between Partisanism and Commercialism

The CCP took three years to revise its guiding ideology and establish the “Emancipating the Mind and Seeking Truth from Facts” ideology. The Third Plenary Session of the Eleventh Central Committee of the Party, held in 1978, shifted the emphasis to modernization. On May 11, 1978, an article titled “Practice is the Sole Criterion for Testing Truth” was published in *Guangming Daily*. This article elaborated the notion of truth in Marxism, claiming that social practice should verify whether a theory was in accord with reality (Hanqi, 1999, p. 429), and that practice is the only criterion to test truth. The article was reprinted in the *People’s Daily*, *Red Flag* magazine (both organs of the CCP), *PLA* [People’s Liberation Army] *Daily*, and other media nationwide. At that time, “Emancipating the Mind” became the main social ethos; this was interpreted as meaning the breaking down of conventions and subjectivism to study new situations and solve new problems. “Practice is Truth” was established as the normative journalism ideology in the post-Cultural Revolution era. After this discussion, many of the newspapers and magazines that closed during the Cultural Revolution reopened. Media reform began, and reporting on economic construction became the focus. The years from 1982 to 1991 saw a wide-scale shift in media ecology. In 1989 the number of newspapers reached 1,618 (from 186 in 1978), and party newspapers yielded the vanguard of press development to evening, business, cultural, lifestyle, youth, and women’s publications. Broadcast television stations developed rapidly, and cable television spread even into rural areas (Ganlin, 2008, p. 367). Newspapers commercialized, paying more attention to advertising and circulation. The degree of open reporting increased so that the National People’s Congress was reported live by both Chinese and foreign journalists. Influenced by Western journalism, in-depth and investigative reports appeared and became more common. Journalism education and research also developed, and journalism degree programs and departments were set up in many universities. Techniques of news interviewing, editing, and broadcasting advanced. The use of laser typesetters, document-processing terminal equipment, automatic picture transmission systems, and international telecommunication satellites by the media greatly improved timeliness and effectiveness.

After the Fourteenth National People’s Congress in 1992, the “Socialist Market System” was proposed and established, gradually pushing Chinese journalism into commercialization. The scale of the mass media expanded rapidly, newspapers were enlarged, and TV channels increased. Groups of urban newspapers appeared and were very popular in the mid-1990s. *Huaxi City Daily* began in 1995 and *Nanfang City Daily* was established in 1997; these were among the first urban dailies with strong commercial features, with advertising income as their major economic source rather than party subsidy. *Nanfang Weekly* (*Nan Fang zhou Mo*) is a key newspaper featuring

“watchdog” reports criticizing politics and society. *Beijing News*, a daily established by *Guangming Daily* and *Nanfang Daily* in 2003, is the first newspaper co-managed by two media groups, indicating a new era of regional and national commercial newspapering. In 2000, Chengdu Boray Investment Holding Group, owner of *Chengdu Business Daily*, became the first publicly traded company in China’s media industry. *Titan Weekly*, featuring sports news, is a successful example of professional media in the market economy. *Titan* began in 1988 with a circulation of 800. In 2005, the circulation rose to 1.6 million daily or over 5 million weekly, accounting for 60% of the market for sports newspapers. *Titan* now has the largest circulation in China.

Competition among the media was very fierce, especially among advertising companies and news groups. At the end of 2009, there was a total of 49 newspaper groups distributing nationally. The influence of TV surpassed the newspapers, and television advertising rates were higher than for newspapers. Chinese journalism reached out to the world with the English-language channel CCTV-9 broadcast from September 2000, and Great Wall Satellite TV available in the United States from October 2004.

Another change in journalism in the post-1992 era was the transformation of the image of women and female journalists. In Confucian China, women were discriminated against, and throughout the nineteenth century women were kept in a box. Not until the Reform movement of 1898 did the first generation of female journalists appear, but in the first half of the twentieth century the situation again deteriorated. In the first Constitution of the People’s Republic of China, approved in 1954, women’s rights were guaranteed, but the slogan of Gender Equality concealed continuing inequality, especially in the Great Leap Forward and the Cultural Revolution. Prominent women in the news were treated as outlandish and called “Iron Lady” or “Forceful Woman.” At the beginning of the 1980s, China gradually joined the rest of the world, and gender inequality truly started to diminish in the construction of a market economy. Women play significant roles in journalism, in the development of city newspapers and commercial TV channels, and more and more outstanding female journalists and TV anchors are emerging, but a deep Confucian culture of male superiority persists.

With the development of information and communication technology, new media – via the Internet, mobile phones, digital TV, mobile TV, IP TV (Internet TV) – came on the scene and enjoyed a great success. Mass media convergence became a major new trend. Numerous media established websites from 1995. According to statistics, network media were the fourth-largest media, and by the end of 2010 there were 457 million “netizens” in China, among which mobile phone netizens numbered 303 million. On the Internet ordinary people could release news, so that the media could more effectively perform the function of social supervision and service. The news published on the Internet also seemed somewhat inauthentic to the mass of people.

New problems appeared in journalism education. Since 2000, journalism majors have increased too fast, and demand for journalism education has produced a shortage of qualified teachers, inadequate funding, and employment difficulties for graduates.

Although the media have developed fast, party control remains. Yuezhi Zhao, an outstanding scholar of Chinese media, has argued that, if China boasts one of the fastest-growing economies since the 1990s, it also has one of the most oppressive regimes in using coercive state power to control public communication (Zhao, 2008, p. 20). Lee Chin-Chuan (2000) has also affirmed that media freedom in China ranks low globally, and that the media system has changed from totalitarianism to authoritarianism even with the national embrace of the capitalist market. Politics and economics are neither friendly nor aloof with one another, and the market is simultaneously interlinked with and trying to divorce itself from state power; the contradiction between them creates the space for the development of media. Media can be the beneficiary of the market, while also the mouthpieces of the party-state. The tension between media and the party-state creates a demand for negative liberty, or freedom from state control and censorship (Berlin, 1969). In order to capture audiences, media compete with each other in innovating new styles and market strategies, but they are dependent on the state because of their enslavement to political direction (Zhongdang, 2000). Media try everything to satisfy media markets in their news style and content, but they always try their best to avoid stepping on the mine of ideology. He Zhou (2000) described the market-oriented party-state media as a capitalist body with a socialist face. The media transformed from the mouthpiece of the party-state to the party's public relations consultant; their mission is not brainwashing, but maintaining the party's positive image and legitimacy. With the development of commercial media and supervisory newspapers, journalism manifests itself increasingly as an important force to facilitate democracy in China.

In a word, journalism in China is full of uncertainty. Reviewing the whole history of journalism in China, journalism's periodic rise and fall moves in rhythm with politics, and the development of media relies heavily on politics and ideology. There is still a long way to go before Chinese journalism catches up with Western journalism.

Communications Networks in the United States

From Chappe to Marconi

Richard R. John

ABSTRACT

The history of communications in the United States is a relatively uncultivated field. Generalizations abound yet conceptual frameworks are few. This essay contends that the history of the country's dominant communications networks can be understood as a chapter in the history of government–business relations, or what contemporaries would have called political economy. In the long nineteenth century that began in 1788 and ended in 1914, the three most important communications networks – that is, the mail, the telegraph, and the telephone – were shaped not only, or even primarily, by technological imperatives and economic incentives, but also by the regulatory regimes in which they were embedded.

by technological imperatives and economic incentives, but also by the regulatory regimes in which they were embedded.¹

The adoption of the federal Constitution in 1788 marked the beginning of a new epoch in US public life. The federal Constitution transformed the United States into a representative republic in which the creation of an informed citizenry became a civic ideal.² This new civic mandate for political communications was institutionalized with the Post Office Act of 1792, a landmark in US communications policy and one of the most far-reaching pieces of legislation to be enacted in the early republic.

The year 1914 is a logical end point for the epoch that began in 1788. This year marked the start of World War I, an event destined to have major consequences for US communications. In addition, and no less significantly, it witnessed the apogee of the long campaign, mostly forgotten today, to transfer the ownership and operation of the telegraph and telephone from private corporations to a public agency.

The heyday of the government ownership campaign was brief. Following the takeover by the federal government of the telegraph and telephone in 1917, government ownership became the target of a withering critique. This critique popularized the still-controversial idea that communications networks were best owned and operated by corporations rather than the state. The normalization of the oft-contested idea coincided with the commercialization of radio as a broadcast medium, a circumstance that would have major implications for US communications in the decades to come.

Historians of communications have long characterized the commercialization of the electric telegraph in the 1840s as a turning point in world history. In so doing, they follow a convention that dates back at least as far as 1907, when historian Henry Adams ventured this claim in his celebrated autobiographical memoir, *The Education of Henry Adams*. Among the many social scientists to endorse this convention have been the geographer Allan Pred (1973, 1980) and the sociologist Anthony Giddens (1987).³ Among historians of communications, it has been an article of faith since 1973, when James W. Carey (1989) explored its implications in a much-cited essay on "The Telegraph and Ideology."⁴ Carey's thesis was elaborated on by his student Richard A. Schwartzlose (1989, 1990) in the first volume of his two-volume survey of the nineteenth-century newsbrokerage business, as well as by Menahem Blondheim (1994) in his monograph on the rise of the New York Associated Press.⁵ This convention would reach a wide popular audience in the 1990s through a long-running exhibit at the Smithsonian Institution on the "Information Age" (Tenner, 1992).⁶

The bifurcation of the history of US communications into two epochs – pre-electrical and post-electrical – is rendered intuitively plausible by the related presumption that, in the pre-electrical epoch, long-distance communications were primitive, irregular, and slow. This presumption is a lecture hall perennial. Had transatlantic communications not been so limited, or so it is often observed, the Battle of New Orleans in 1815 would never have been fought, since the protagonists would have known that the Treaty of Ghent ending the war had already been signed.⁷ While this

presumption is superficially plausible, it is contradicted by much of what we know about long-distance communications in the decades between 1788 and 1840. Much depends on the frame of reference. If one compares the 1788–1840 period with the years that preceded it, rather than with the years that it preceded, it no longer appears quite so backward (John, 1994). The transformation of the informational environment in the early republic was so dramatic that Pulitzer Prize winning historian Daniel Walker Howe (2007) has contended, drawing on a raft of specialized studies, that it constituted a “communications revolution.” (For a survey of historical writing on the “communications revolution” concept, see Behringer, 2006; John, 1994).

In no realm was access to high-speed, long-distance communications more valued than in trade. For merchants dealing in agricultural staples, access to up-to-date information on market trends, known colloquially as “fresh news,” had long been a priority. The most highly coveted commercial information was the price of cotton and wheat in Liverpool, Le Havre, and the other leading commercial entrepôts of Europe (Albion, 1932, 1939; John, 1994). High-speed long-distance communications were so highly valued that, in 1825, a government administrator (Postmaster General John McLean) committed the government to outpacing any non-governmental carrier in the conveyance of information on market trends (John, 1995).

Political information was also in high demand, especially in times of great uncertainty. During the nullification controversy in South Carolina in 1832–1833, for example, the editors of a prominent New York City-based commercial newspaper – the *Journal of Commerce* – invested heavily in a Washington, DC–New York City horse express in the expectation that the information it yielded would enable them to outpace their rivals in the publication of dispatches originating at the seat of power (Blondheim, 1994, p. 19).

The electric telegraph is sometimes lauded as the first medium to divorce transportation from communications. Here, too, however, the reality is more complicated. The differentiation of transportation from communications had been a central element of postal policy in the United States ever since the establishment of the first mail distribution centers around 1800 and would be a defining feature of the optical telegraphs established shortly thereafter in Boston and New York City (John, 1995, Ch. 2; 2010a, Ch. 1).

The most elaborate optical telegraph of the age was invented in 1792 in France. It was the brainchild of Claude Chappe, a government functionary who had been enlisted by the revolutionary regime to centralize the circulation of information in Paris. The hub-and-spoke network that Chappe established was far more elaborate than any optical telegraph in the United States (Holzmann & Pehrson, 1995; Headrick, 2000, Ch. 6). In fact, the US-based optical telegraphs that Chappe’s innovation helped inspire are best characterized as lines rather than networks, since they had not been designed to unite the country, like their French predecessor, but, rather, to link the North Atlantic sea lanes with an Atlantic seaport. Despite these limitations, the US optical telegraphs were a hallmark of the informational environ-

ment in the pre-1840 period. Many newspapers from these years, for example, carried the word “telegraph” on their masthead, a reminder of the extent to which the existence of the optical telegraph was common knowledge long before the coming of the electric telegraph. (For a related discussion, see Crain, 2003; John, 2010a, Ch. 1.) The optical telegraph was unquestionably one of the “greatest improvements of modern times,” declared linguist John Pickering in 1833 in a public lecture before the Boston Marine Society: “no means of conveying intelligence can ever be devised that shall exceed or even equal [its] rapidity [. . .] for with the exception of the scarcely perceptible relay at each station, its rapidity may be compared with that of light itself.” Unfortunately, Pickering lamented, many of the technical features of this remarkable medium remained little-known: “Every one of us hears and reads of news by the [optical] telegraph, from day to day, without ever considering, much less understanding any thing of the principles of this mode of communicating intelligence” (cited in John, 2010a, pp. 14–15).

The most important high-speed, long-distance communications medium in the United States in the pre-1840 period was not the optical telegraph but the mail. The enactment of the Post Office Act of 1792 created what one might call a republican regulatory regime for the circulation of information on public affairs. For the founders of the republic, the creation of an informed citizenry was far too important to be left to the vagaries of the marketplace. Instead, they entrusted this task to a government agency: the Post Office or what would soon become known as the Post Office Department. The mail became a “system” not only or even primarily because of the federal government’s organizational capabilities, but also, and more fundamentally, because lawmakers had invested a government agency with a civic mandate to facilitate the low-cost conveyance of information on public affairs (John, 1995).⁸ To institutionalize this civic mandate, the Post Office Act of 1792 permitted certain kinds of publications – including, in particular, newspapers – to circulate in the mail at rates far below the cost of their conveyance. In addition, and no less remarkably, this law permitted publishers to enter their publications into the mail at any post office in the country, creating a polycentric informational environment that set the United States apart from the nation-states of Europe (Brown, 1989; John, 1995; Kielbowicz, 1989; Starr, 2004).

James W. Carey (1989) has perceptively characterized communications policy in the United States as favoring the “transmission” of information over vast distances. Carey aptly identified one of the defining features of US communications, yet left unspecified the mechanism by which this policy was translated into practice. The most important of these mechanisms in the early republic was the clause of the Post Office Act of 1792 that transferred control over the designation of new post routes from the executive to the legislature. Ordinary citizens craved access to postal facilities and lawmakers were quick to oblige. (For a reconstruction of the postal petitioning process, see John & Young, 2002). By 1828, the year in which Andrew Jackson defeated John Quincy Adams to become the sixth president of the United States – an event often hailed as a landmark in the democratization of US electoral politics –

postal administrators had established hundreds of post offices and post routes that could not possibly cover their cost.⁹

The civic mandate of the Post Office Department had well-defined boundaries. Though the federal Constitution authorized Congress to “establish” post roads, this mandate was confined, at least in the states, to the designation of thoroughfares but not their construction. The road-building ban helps explain why stagecoach passengers in the early republic complained so often about the bumpiness of their ride. The Post Office Department had the authority to subsidize the operation of stagecoaches, but not the thoroughfares over which they ran (Holmes & Rohrbach, 1983; Jaffe, 2010; John, 1995, Ch. 2). In the territories, in contrast, the federal government’s road-building mandate was more expansive; in fact, the construction of roads was sometimes justified, at least in part, as necessary for the conveyance of the mail (Hudson, 2010; Southerland & Brown, 1989).

The primary limitation on postal policy in the early republic was fiscal. Lawmakers by 1800 had abandoned the presumption that the Post Office Department should return a surplus to the general treasury. In Great Britain, in contrast, fiscal considerations would remain important throughout the nineteenth century. The celebrated 1840 rate reductions known as “penny postage,” for example, would be justified in large part as a revenue-generating measure. US lawmakers had abandoned revenue generation by 1800. Yet not until after 1851 would they give up on the related idea that the Post Office Department should break even (Fuller, 1972, Chs. 2, 5). To balance revenue and expenditures without stifling network expansion, postal administrators became increasingly bold at asserting that the Post Office Department enjoyed a legally enforceable monopoly. The scope of this monopoly, in their view, embraced the conveyance on a regular schedule of certain kinds of information, including, in particular, personal correspondence. Though the precise definition of this monopoly remained contested, few lawmakers challenged its constitutionality, and the courts mostly acquiesced (John, 2004).

The most expansive feature of the Post Office Department’s civic mandate concerned the kinds of information that it had an obligation to convey at a cost that was sufficiently low so that this information would be accessible to the entire population. The most favored kind of information concerned public affairs, a preference – or in the language of media scholar Harold A. Innis, a “bias” – that spawned huge postal subsidies for newspapers, government documents, magazines, and the correspondence of lawmakers.

The Post Office Act of 1792 said nothing about the speed with which information was to be conveyed. Information on public affairs, after all, only slowly went stale. Commercial information, however, was a different matter. Here speed was often all-important, a circumstance that Postmaster General John McLean acknowledged in 1825 when he committed the Post Office Department to outpacing non-government carriers in the conveyance of information on market trends (John, 1995, Ch. 2).

McLean’s gospel of speed furnished the rationale for the failed campaign of electric telegraph inventor Samuel F. B. Morse to graft his invention onto the Post Office

Department. Congress demurred and the telegraph was commercialized as a private enterprise, decisively severing the link between the government and the high-speed conveyance of information (John, 2010a, Ch. 1). Rapid delivery would remain a desideratum for postal administrators – and postal users – for decades to come. Yet never again could postal administrators boast that the mail was the *sine qua non* of speed.

The next major expansion in the civic mandate of the Post Office Department came in 1845. Goaded by irate users, and challenged by non-government carriers – the so-called “private expresses” – Congress significantly lowered the basic letter rate, an innovation that had the effect, as was its intention, of expanding the mandate for the low-cost conveyance of the mail to embrace information on personal affairs (Henkin, 2006; John, 2010a, Ch. 1).¹⁰ In Great Britain, postal administrators rationalized the low-cost conveyance of information on personal affairs (“penny postage”) as a fiscal measure that would increase the revenue that its post office returned to the Crown. In the United States, in contrast, this policy (“cheap postage”) was justified more broadly as a public good.¹¹

The electric telegraph would be commercialized in a regulatory regime quite different from the regulatory regime in which the mail had evolved. Yet this was by no means obvious to the first generation of telegraph promoters. These promoters, led by Morse’s business agent, Amos Kendall, envisioned the new medium as a creature of the state. And, in particular, Kendall presumed that the telegraph, like the mail, should be operated by the Post Office Department under centralized control. To bring this about, Kendall lobbied Congress to buy out Morse’s patent rights, which he construed as a federally guaranteed quasi-monopoly grant. When Congress demurred, Kendall transformed Morse’s patent rights into franchises that he licensed on a geographical basis (John, 2010a, Ch. 3).

The “supervening necessity” for the establishment of a telegraph network in the 1840s was not the railroad – as it had been in Great Britain, according to media scholar Brian Winston (1998, Ch. 1) – but, rather, merchant demand for commercial information on market trends.¹² The commercial information that Kendall presumed to be the most valuable concerned the market price in Europe for cotton and wheat, the same kind of information whose conveyance Kendall had tried to facilitate a decade earlier as postmaster general under Andrew Jackson (John, 2010a, Ch. 3).

The electric telegraph is sometimes called the “Victorian Internet” (Standage, 1998). This characterization is superficially apt, since the electric telegraph and the Internet each utilized electricity as a motive power and each relied for their operation on a cadre of highly skilled “online” technicians.¹³ Yet it is both anachronistic and misleading. In reality, the electric telegraph and the Internet have remarkably little in common. Though the telegraph network was, in theory, open to anyone, in practice, telegraph rates were sufficiently high, and telegraphic facilities sufficiently limited, that it remained restricted to an exclusive clientele. Surprisingly little would change in the period between the opening of the first telegraph office in 1845 and the restructuring of the telegraph network in 1910. To the extent that a “Victorian

Internet” existed in the nineteenth century – that is, a medium designed to provide the entire population with the necessary facilities to circulate point-to-point information over long distances and at high speed – it was not the electric telegraph, but the mail.

Kendall’s patent-rights-oriented business strategy sparked a concerted opposition that doomed it to collapse. Rival promoters ridiculed Kendall’s plan to make Morse’s patent rights the cornerstone of a legally sanctioned monopoly, newspaper editors warned about the implications of the new medium for commerce, and lawmakers concurred (John, 2010a, Ch. 3).

Among Morse’s most pointed critics were the proprietors of the principal daily newspapers in New York City. Troubled by the potential implications of the electric telegraph for the newspaper business, they banded together to form a news brokerage called the New York Associated Press (NYAP). Contrary to what seems to be a common impression among historians of communications, the beginnings of the NYAP predated the Mexican–American War. A primary catalyst was the challenge to the New York City newspaper press posed by Samuel Colt, a Morse licensee who, in 1845, established the first electric telegraph line in New York City. Colt’s electric telegraph, like the optical telegraph that it supplanted, linked the North Atlantic sea lanes to the city’s merchant elite. It was designed, or so Colt boasted in a promotional broadside that he issued explaining its rationale, to supersede the New York City newspaper press by transmitting information directly from the sea lanes to the country’s major commercial centers, rendering the city’s newspapers irrelevant as a purveyor of up-to-date news (John, 2010a, Ch. 3).

The civic ideals that shaped the regulatory regime in which Morse’s critics emerged owed less to the republicanism of the lawmakers who founded the republic than to the antimonopolism of merchants, rival telegraph promoters, and the newspaper press. Each of these groups had by 1848 grown suspicious of the special privileges that lawmakers lavished on Morse and were determined to create a political economy in which market competition could flourish. Antimonopoly hastened the enactment of the New York Telegraph Act of 1848, a law intended to facilitate the entry into the telegraph business of insurgent promoters to compete against Morse. Similar antimonopoly laws would be enacted in the following few years in almost every state.

The regulatory regime that lawmakers established to coordinate the electric telegraph was not intended, like the regulatory regime it supplanted, to be coordinated by a single organization that was ultimately accountable to Congress. Rather, it relied on competition to ensure that no single company dominated the informational environment. So long as it was possible for new entrants to enter the business, or so lawmakers reasoned, no other legislation was necessary to protect the public good.

Among the beneficiaries of antimonopoly were the promoters who established Western Union, of whom the most successful was Hiram Sibley. Unlike Morse and Kendall, Sibley did not count on federally guaranteed patent rights to protect him against rival promoters. Rather, Sibley relied on the right-of-way privileges that state lawmakers had granted railroads under state law. By negotiating exclusive right-of-

way agreements with strategically located railroads, Sibley devised a business strategy that circumvented Morse's patent rights. Sibley's business strategy would lead eventually to the emergence of Western Union as the country's dominant telegraph company, an event that occurred in 1866.

The antimonopoly regulatory regime in which Western Union flourished presupposed the existence of rivals that would keep rates down and performance standards high. For this reason, the emergence of Western Union as the dominant network provider in 1866 was for many lawmakers a cause for concern. Among these lawmakers was Congressman John Sherman of Ohio. To check Western Union's power, Sherman sponsored a major piece of legislation that would come to be known as the National Telegraph Act (1866). Neither Sherman nor anyone else in 1866 regarded Western Union as a "natural monopoly" that owed its dominant position in the telegraph business to technological imperatives and economic incentives. This is worth underscoring, since in the twentieth century this anachronistic characterization of the post-1866 telegraph business would become the conventional wisdom among business historians. The "natural monopoly" hypothesis, for example, figures prominently not only in Robert Luther Thompson's *Wiring a Continent* (1947) but also in Alfred D. Chandler, Jr.'s *Visible Hand* (1977).¹⁴

The National Telegraph Act was the federal counterpart to the many state telegraph acts that had been modeled on the New York Telegraph Act of 1848. Compliance was voluntary. No telegraph company was obliged to sign the law; several, including Western Union, briefly held out. Every telegraph company that did sign on was guaranteed certain privileges. In return, these telegraph companies agreed to permit Congress to buy them out at a mutually agreed-upon price and to convey information for federal government agencies at rates to be determined by the postmaster general (John, 2010a, Ch. 4).

The initial refusal of Western Union to assent to the National Telegraph Act is not surprising. After all, the primary rationale for the law was to open up the telegraph business to new entrants. Harder to explain was the willingness of Hiram Sibley in 1867 to abide by its provisions. Though Sibley had by this time stepped down as Western Union's president, no company official ever questioned the legality of his decision. Why Sibley signed on is a matter of conjecture. It is conceivable that he assumed that the law would prove advantageous to the company's shareholders, since it included a provision that protected their rights. It is also possible that Sibley feared that, if Western Union did not acquiesce, the US army might not defend its assets in the former Confederate states (John, 2010a, Ch. 4).

The primary benefit of the National Telegraph Act for telegraph companies was access to rights-of-way. In theory, assenting telegraph companies would henceforth have the right to string telegraph wires along any routes in the country that had been designated a post route. Had the courts construed the right-of-way clause broadly, Western Union would have been highly vulnerable to insurgent network providers, since the company relied heavily on exclusive right-of-way contracts to block would-be rivals from contesting key markets. With one exception, however,

the courts construed this privilege quite narrowly. The exception occurred in the late 1870s when, in a succession of right-of-way cases, the courts ruled against Western Union and in favor of financier Jay Gould, who was then an insurgent telegraph promoter, facilitating Gould's ultimately successful raid on Western Union. Following Gould's takeover of Western Union in 1881, jurists reverted to the narrow construction of the right-of-way clause that had prevailed prior to Gould's raid (John, 2010a, Ch. 4).

The primary benefit of the National Telegraph Act for the government was rate-setting. In keeping with the anti-interventionist logic of the antimonopoly regulatory regime, telegraph companies had the right to charge whatever rates they pleased. (Postal rates, in contrast, continued to be set by Congress; telephone rates would also be highly regulated, at first primarily by city councils.) One exception to this anti-interventionist logic was the federally funded telegraph line that contractors built in conjunction with the Pacific Railroad.

A second exception was the rate-setting clause of the National Telegraph Act. Every telegraph company that assented to this law was henceforth obliged to transmit telegraphic dispatches for federal government agencies at rates to be determined by the postmaster general. This might seem like a minor matter. In fact, a government-mandated rate cap made it economically feasible, for the first time, to forecast weather patterns with a fair degree of precision. Weather forecasting in the post-1866 period was a specialty of the US Signal Service, the government agency that had provided logistical support for the army during the Civil War. Now that the war had ended, the signal service cast about for something to do. The government-mandated rate cap made it possible for the signal service not only to collect the vast amount of weather-related data necessary to forecast the weather but also to circulate this information throughout the country, a major boon for commerce.¹⁵

The congressional buy-out clause in the National Telegraph Act had a far-reaching influence on the operations of the telegraph network. Everyone conversant with the business understood that all of the major network providers – including Western Union – had consented to permit Congress to purchase their assets at any point five years after its enactment. The purchase price was to be agreed upon by five commissioners – two of whom were selected by the government, two by the company, and the fifth by the other four.

Congress never exercised the buy-out option. Even so, the fact that by 1867 every major telegraph company in the country had assented to a congressional buy-out would have major implications for the policy debate over the telegraph network. Most obviously, the buy-out clause insured that this debate would revolve primarily around practical matters, such as the relative merits of government administration and corporate management, rather than the broader, more ideologically fraught issue of the proper relationship of capitalism, socialism, and democracy. Interestingly, few critics derided a congressional buy-out of the telegraph network as un-American or unconstitutional, a charge that critics would almost certainly have voiced had lawmakers attempted anything comparable after World War I.

The buy-out clause also shaped the market for telegraph securities. Telegraph investors understood that, if Congress bought them out, they were certain to net a handsome profit. Not surprisingly, it was widely rumored in the press that major Western Union investors, including the prominent railroad and steamship magnate Cornelius Vanderbilt, had secretly endorsed the buy-out and were lobbying behind-the-scenes to bring it about (John, 2010a, Ch. 4).

The consequences of the buy-out clause were by no means confined to telegraph investors. So long as a buy-out remained even a remote possibility, speculators in telegraph securities could boost the price of Western Union shares by floating credible rumors that Congress was about to act. It was equally easy to depress the price of Western Union shares. All a speculator had to do was to float a credible rumor that Congress intended to back a rival network provider (John, 2010a, Ch. 5).

No one proved more adept at manipulating the price of Western Union shares than Jay Gould. To roil the markets, Gould relied not only on the business press, which was easily influenced, but also on lawmakers, whom he had little trouble recruiting, and the courts, which proved equally malleable. To enhance his credibility, Gould invested in rival telegraph companies and in telegraph-related patent rights. For a brief period in the mid-1870s, a full-scale bidding war erupted between Gould and Western Union president William Orton over the patent rights to inventions that might conceivably prove useful in the telegraph business. The resulting entrepreneurial hothouse – a byproduct of the antimonopoly political economy in which Gould flourished – generated, in short order, four of the most notable inventions of the century: namely, the broadband telegraph; the telephone; the phonograph; and the electric power station (John, 2010a, Ch. 4).

Gould's takeover of Western Union in 1881 transformed the competitive landscape. Astonishingly, the country's most outspoken antimonopolist had suddenly emerged as the largest shareholder in the country's dominant telegraph network provider. Gould's sudden emergence as a communications magnate troubled citizens from all across the political spectrum. In no sense was it a partisan issue. Democrats were outraged and so too were Republicans. Perhaps unsurprisingly, Gould's ascendancy proved especially unsettling to the small yet influential cohort of big-city merchants, bankers, and wholesalers who sent telegrams and invested in corporate securities.

Congress would not enact a major piece of telegraph legislation until 1910. In that year, it decreed for the first time that the telegraph and telephone were common carriers, a legal term of art that carried with it the strong presumption that, like railroads and package carriers, they would be subject to permanent regulatory oversight to ensure that the interests of their investors were aligned with the public good. Yet the die had been cast with Gould's takeover of Western Union in 1881. No longer was it plausible to contend, as it has been during the heyday of the antimonopoly era between 1848 and 1881, that the only regulatory mechanism necessary to align the telegraph business with the public good was the enactment of legislation to encourage new entrants to challenge incumbents. To underscore this subtle yet

momentous intellectual sea-change, the political economist Richard T. Ely popularized a new concept. The telegraph business, Ely contended in 1888, was a “natural monopoly” that, as a result of its history, was impervious to competition. Ely did not popularize this concept to bolster the case that the telegraph was best coordinated as a managerial corporation, anticipating, as it were, the twentieth-century business historian Alfred D. Chandler, Jr. Rather, he floated it to strengthen the case for government ownership (John, 2010a, Ch. 5).

Politics had artifacts, to invert the well-known formulation of political philosopher Langdon Winner. Telegraph companies like Western Union flourished in an antimonopoly regulatory regime in which lawmakers looked to competition to regulate business behavior. As a consequence, telegraph managers confined themselves to the most lucrative markets and rarely invested in facilities that could not be expected to generate a steady return. Western Union managers were particularly loath to presume that the telegraph, like the mail, might one day become a genuinely popular medium. Western Union’s position was reiterated by its president, Norvin Green, as late as 1890. Fewer than 10% of US citizens would prefer the telegraph to “letter communication,” Green predicted, even if the cost were identical (cited in John, 2010a, p. 7).

In the telephone business, as in the telegraph business, political structure shaped business strategy.¹⁶ In the telegraph business, lawmakers repeatedly enacted legislation to encourage would-be network providers. This legislation created a regulatory regime in which, or so it was long assumed, rate regulation was superfluous and performance standards best left to market demand. The telephone business, in contrast, emerged in a regulatory regime that was in a dual sense progressive. The regulatory regime was progressive not only in the sense that lawmakers presumed innovation to be more-or-less continuous and unending, but also in the sense that they rejected competition as the primary regulatory mechanism. From the outset, telephone operating companies held municipal franchises that limited entry and mandated rate caps and performance standards. At no point in the early history of the telephone business – and not even during the so-called “competitive” period that followed the expiration of the original telephone patent rights in 1894 – was open entry the norm.¹⁷ On the contrary, lawmakers regarded access to the network for new users to be a superior measure of network performance to access to the network for would-be network providers.¹⁸ The progressive regulatory regime obliged telephone companies to meet performance standards far stricter than the performance standards that the antimonopoly regulatory regime had required of telegraph companies. In return, it promised a more stable operating environment that proved in practice to be highly conducive to technical advance.

The commercial potential of the telephone had been established by 1878. Not surprisingly, given the widespread recognition that the new business was likely to prove lucrative, a brief competitive struggle ensued between Western Union and a group of promoters whose most valuable asset was the patent rights that the federal government has assigned to telephone inventor Alexander Graham Bell. The two

rivals cut a deal in the following year, and Western Union bowed out. For over 100 years – that is, from 1879 until 1984 – the dominant telephone network provider in the United States traced its origins to the investor consortium that coalesced around Bell's patent rights.

The telephone business was more variegated than the telegraph business. Of the various institutions spawned by Bell investors, three were of special importance. These were the Bell-associated holding company that controlled the portfolio of patent rights around which the business evolved; the long-distance Bell-associated operating company, which was, early on, a money loser; and the local Bell-associated operating companies, which were for many decades at the center of the network. Much confusion has been caused by the mistaken presumption that the telephone business in its formative era was centrally controlled by the Bell-associated holding company, which, after 1900, would be known as the American Telephone and Telegraph Company, and which would eventually come to be known by its acronym, AT&T. In fact, the most consequential innovations in the pre-1914 period occurred in the Bell-associated operating companies, of which the most important were located in New York City and Chicago (John, 2010a, Ch. 8; Maguire, 2000; Weiman, 2004).¹⁹

The second competitive interlude in the telephone business occurred in the years that immediately followed the expiration of Bell's original patent rights in 1894. Like the first competitive interlude, it was rapid, consequential, and short-lived. In particular, it witnessed the emergence of a rival, non-Bell consortium of telephone operating companies that would become known as the "independents." The independents had their own equipment manufacturers, trade association, and trade press. They surged around 1900, peaked in 1907, and were rescued by lawmakers in 1913, victims, like so many similar ventures in US business history, of a fatal combination of promotional overconfidence and speculative finance.

The rise of the independents underscored the pent-up demand for telephone service that the Bell-associated operating companies had failed to meet during the previous 15 years. Independent promoters were emboldened not only by the existence of this demand, but also by a sympathetic legal environment. Had the courts been so inclined, they could have defined broadly the many patent rights that the Bell holding company retained. In addition, they might have banned the exclusive market-segmenting interconnection agreements that independents entered into with each other to strengthen their competitive position. Yet the courts did not. In so doing, they segmented the market for telephone service and created the highly contrived competitive conditions in which the independents emerged.

The rapid expansion of the telephone business in the post-1894 period is of great significance for students of US communications. The telephone was the first electrical communication medium to be reconfigured to become accessible not only to an exclusive clientele – like, for example, the telegraph – but also to the entire population. In the United States, this reconfiguration began in the late 1890s and was mostly complete by 1907 (John, 2010a, Ch. 8).

The popularization of the telephone was a byproduct of two related yet distinct developments. The first was the rise of the independents. Thousands of citizens made their first telephone call on an independent telephone, partly because the independents were quick to cover the field, and partly because they ordinarily offered lower rates than their Bell rivals (Mueller, 1993, 1994).

The second and even more consequential development was the re-engineering of the big-city telephone exchange. Expansion posed an unusual problem for telephone managers that differentiated the telephone business from most other businesses with which it might be compared. If a manufacturer doubled his output, it was taken for granted that he could find ways to reduce his unit costs. In the telephone business, however, the situation was very different. Telephone switching was expensive and, in this period, every Bell-associated telephone exchange was operator-assisted. That is, it required the intervention of a telephone company employee – almost always a young woman – to complete the connection. If the size of the exchange doubled, the number of connections increased fourfold, obliging the telephone company to increase the size of its staff, and, in certain cases, upgrade its switching equipment (Mueller, 1989). To make matters even more complicated, telephone rates in the largest operating companies, including New York City and Chicago, were set not by the company, but by the government agency that had jurisdiction over the territory in which it operated. In New York City, the government agency was the state legislature; in Chicago, the city council.

Had big-city operating companies charged by the call, increased revenue would have offset at least part of the costs of expansion. Unfortunately for the companies, with a few minor exceptions, they did not. In large part, this was because, early on, users preferred a fixed (or “flat rate”) calling plan that provided them with an unlimited number of calls inside a particular territory (John, 2010a, Chs. 6–7).

Flat rates were a good deal for heavy users, the vast majority of whom were businessmen. But they were too high to appeal to non-business users, a potentially huge market that at this time remained untapped. By championing flat rates, big users defended a rate structure that slowed, and in some instances blocked, telephone popularization. Big-user preferences also exerted a subtle influence on the writing of telephone history by fostering the mistaken presumption that ordinary people opposed measured service (Fischer, 1992; Lipartito, 1995).²⁰

Under the circumstances, telephone operating company managers had good reason to keep their exchanges small. Why, then, did they expand? In New York City and Chicago, two reasons loomed uppermost. First, managers feared government regulation and regarded network expansion as a counterweight. If the user base expanded, a larger percentage of the electorate would have an interest in telephone service. Second, they recognized that it might be possible to increase revenue if they could recruit new users willing to experiment with novel calling plans that linked usage with cost. These calling plans – which, collectively, were termed measured service – offered users a variety of options that greatly increased the attractiveness

of the medium for users who would never have considered paying a single high fixed rate (John, 2010a, Ch. 8).

The outcome of network expansion was dramatic. The New York City telephone exchange had 9,627 telephones in 1895 and 361,302 in 1910; the Chicago exchange had 11,680 in 1895 and 239,083 in 1910. Much of this expansion occurred in residential districts, a sector that telephone managers had not much cultivated prior to this time. Almost all of the new users signed up not for flat-rate service but for some kind of measured service. In this way, the telephone companies were able to recoup some of the costs of network expansion (John, 2010a, Ch. 8).

The fact that no comparable expansion occurred in this period in Toronto, Canada is revealing. In Canada, the national government prevented municipal or provincial authorities from regulating telephone rates. As a consequence, company managers had less of an incentive to expand.²¹

Network expansion blunted political pressure for potentially ruinous rate caps. Yet it had its own risks. What if a new medium emerged that provided users with point-to-point real-time communication, but which did not require the enormous investment in a wire network? This risk troubled the managers of the holding company that had invested in the Bell-associated operating companies and led them in the early 1900s to embark on an ambitious research-and-development program. The goal of this program was to obtain patent rights to a new medium called wireless telegraphy that was being rapidly commercialized in the United States by the Italian inventor Guglielmo Marconi.

Wireless telegraphy evolved into radio, a medium long regarded primarily as a form of broadcasting. In the early 1900s, however, it seemed far more likely that radio would be commercialized as a point-to-point medium in direct competition with the telephone. Researchers funded by Bell's holding company worked assiduously to parry this challenge, fearful that, if they did not, their huge investment in a wired telephone network would become worthless.

For technical, economic, and political reasons, these fears proved unwarranted. Bell's research agenda would, however, have unanticipated consequences that did shape its business strategy. Research on wireless telegraphy led Bell engineers to invent a device that could amplify an electrical signal, an invention that historians of technology hail as the advent of electronics. This device – the three-element vacuum tube – enabled Bell engineers to link New York City and San Francisco in a single transcontinental telephone network, a feat they achieved in 1915.

The significance of transcontinental telephony is easily misconstrued. Bell public relations announcements trumpeted it as a public good with momentous economic, cultural, and political implications.²² A multitude of AT&T-centric Bell staffers, historians, and social scientists have followed their lead (Auw, 1983; Boettinger, 1983; Galambos, 1992; Latour, 1987; Pool, 1983; Pool, Decker, Dizard, Israel, Rubin, & Weinstein, 1977; Smith, 1985). In fact, the primary significance of transcontinental telephony in its early years was promotional. By linking Bell with technical advance,

it blunted the oft-voiced critique that Bell was technically backward. This public relations benefit more than offset the cost of maintaining the long-distance network, which was considerable.

Transcontinental telephony played little role in the contest between Bell and its independent rivals. This contest peaked in 1907, long before the line was completed. Two events in 1907 proved especially critical in dooming the independents' challenge. The first was the collapse of a major independent-backed combine, the United States Independent Telephone Company of Rochester, New York. This collapse made it virtually impossible for other independents to raise revenue in the financial markets, a crippling blow. The second was the rechartering of the Chicago Telephone Company by the Chicago city council, an event that signaled the demise of antimonopoly as a solution to the problems that economic consolidation posed (John, 2010a, Ch. 9).

The collapse of United States Independent and the rechartering of Chicago Telephone preceded the return to Bell of Theodore N. Vail, the telephone executive who would serve as president of American Telephone Company from 1907 until his death in 1920. Beginning in 1878, Vail had held various posts at a number of Bell-associated operating companies, before leaving the telephone business in 1889. In 1907 Vail returned. The timing of Vail's return is worth underscoring, since many AT&T-centric historians credit Vail with inventing the business strategy that would lead to the emergence by 1913 of the telephone business as a regulated monopoly in which Bell enjoyed a dominant position, an outcome that would stabilize the telephone business for the next 70 years. In fact, Vail would not re-enter the telephone business until after telephone service had been popularized, an event that occurred between 1894 and 1907, when he was out of the business. The irrelevance of Vail to the popularization of the telephone has been deliberately underplayed by AT&T-sponsored corporate hagiography and the scholarship that has given it academic legitimacy, both of which invested Vail with almost divine powers as the savior of the telephone network over which he would preside for 13 years.

The events of 1907 posed a major dilemma for independent promoters, investors, and equipment manufacturers. Henceforth, it would prove very difficult for them to obtain the necessary venture capital to remain viable rivals to Bell. How, then, might they protect their own investment in a fixed-wire telephone network? Two options suggested themselves. First, they might sell out to Bell. This solution was economically attractive, yet politically problematic. Pro-independent lawmakers might disallow the merger as anticompetitive, while the remaining independents would warn that the sale to Bell of any independent property would weaken their own investment, since, at this time, the interconnection of Bell and independent telephone networks remained a matter of contestation.

The second option was to mobilize the state to insulate the independents from the market. This option appealed to a small but influential cohort of uncompromising independents, most of which were relatively modest in size, that refused to negotiate with Bell, the preferred strategy for the large independents. To protect themselves from market pressure, the uncompromising independents convinced the

federal justice department to reopen a lawsuit charging Bell with anticompetitive behavior. This lawsuit led in 1913 to a settlement between Bell and the federal government that had been brokered by Attorney General James C. McReynolds. The McReynolds settlement is sometimes misleadingly known as the “Kingsbury Commitment,” after a Bell vice president, a convention that obscures the extent to which it was an independent victory and a Bell defeat. It had three main provisions. First, it established an orderly process to facilitate the interconnection of Bell and independent telephone exchanges that minimized the likelihood that, if Bell purchased the assets of a one-time rival, it would find itself slapped with a lawsuit charging it with engaging in anticompetitive behavior. Second, it obliged Bell to divest Western Union, frustrating Vail’s plan to unite the telegraph and telephone in a single interlinked network, a plan that had hastened the popularization of telegraph service for the first time in 1910. And, third, and, for the independents, most critically, it put the imprimatur of the federal justice department behind the Bell-independent segmentation of the telephone market, making it far easier for the many independents that remained to obtain the necessary funding to upgrade their facilities (Hochfelder, 2002; John, 2010a, Ch. 10; for a different perspective, see Schiller, 1998).

World War I marked the beginning of a new chapter in the history of US communications. Though the United States would not enter the war until 1917, the outbreak of hostilities in Europe affected US communications in two ways. First, it underscored the enormous importance of communications as a weapon of war. The United States in 1914 remained a minor player in international communications. The British government controlled much of the world’s international telegraph network and a British company – Marconi – dominated radio research (Aitken, 1985; Headrick, 1991; Hugill, 1999). Federal lawmakers regarded this situation as unacceptable and took steps to hasten US government control over both radio and international telegraphy. The Navy appropriated Marconi’s patents in 1917; in the following year, the Post Office Department assumed control of all international telegraph lines that had been landed on the US coast. The US radio business grew directly out of these wartime actions. The Radio Corporation of America (RCA), for many decades a leading manufacturer of radio equipment, traced its origins to the patent pool that the US Navy established, in conjunction with several other interested parties, including Bell, in 1919. The first commercial radio broadcasts occurred in the following year (Douglas, 1987).

World War I also witnessed a major shift in popular assumptions regarding the relative merits of government administration and corporate management. Popular support for a congressional buy-out of the telegraph and telephone network was high in 1914. It was, in fact, for this reason that Bell publicists took such care to boost the transcontinental telephone. By demonstrating that Bell could promote technical advance, they rebutted one of the major arguments for a government takeover. The federal government would, in fact, take over the telephone and telegraph in 1917 (John, 2010a, Ch. 11). Government administration, however, proved highly unpopular, dooming government ownership as a realistic policy option. This failed experiment hastened the legitimation of the managerial corporation as an

organizational form, an outcome that cast a long shadow not only on US communications, but also on the US political economy (Vietor, 1994).

In the period between 1788 and 1914 the mail, the telegraph, and the telephone evolved in relationship not only to technological imperatives and economic incentives, but also to governmental institutions and civic ideals. The mail was reshaped beginning in 1792 by a republican regulatory regime that presumed that the citizenry had a right to convenient access to information on public affairs. By 1825, this presumption had expanded to embrace information on market trends; by 1845, to information on personal matters. The telegraph was commercialized in a political economy in which republicanism was rapidly being supplanted by antimonopoly. In the antimonopoly regulatory regime, lawmakers presumed that the public good would be best promoted by legislation that encouraged new entrants to challenge incumbents. Equal access became associated less with citizens – as it had been, for example, in the republican regulatory regime – than with would-be network providers and their expectant clients. The telephone emerged in a political economy in which antimonopoly made little sense as a regulatory mechanism. In its place, lawmakers created a progressive regulatory regime. The fruits of technical advance, they assumed, should be accessible not only or even primarily to would-be network providers and their clients, but also, and in particular, to end users, whom they conceptualized not as citizens but as consumers. The progressive regulatory regime remained largely uncontested until the 1970s, when it would be challenged by a revival of antimonopoly – the intellectual rationale for the break-up of the Bell System in 1984 and the Telecommunications Act of 1996. Antimonopoly has not gone uncontested. Yet it remains, to a far greater degree than republicanism or progressivism, the hallmark of the political economy of communications in the United States today.

NOTES

- 1 For a more general discussion of nineteenth-century “regulatory regimes” and their potential as an organizing theme for historians of the nineteenth-century United States, including historians of communications, see John (2006) and Beckert (2012, esp. pp. 322, 334–335).
- 2 Historians of communications in the early US republic have long been intrigued by the role of communications media in creating and sustaining an informed citizenry. On the concept of an informed citizenry, see Brown (1996). On the influence of communications media on civic identity, see John (1995), Schudson (1998), and Starr (2004). For a complementary approach to the relationship between communications and civics that focuses on ideas rather than institutions, see Wood (2006).
- 3 Especially influential, at least among social scientists, has been Giddens’s sweeping claims regarding the epochal significance of the electric telegraph in transforming conventional assumptions concerning time, space, and speed. For a related discussion, with additional citations, see Behringer (2006).
- 4 One oft-remarked feature of Carey’s essay on the electric telegraph was the extent to which his deployment of vivid metaphors to underscore the world-historical significance

- of the new medium rendered his essay vulnerable to his own well-known critique of the “rhetoric of the electrical sublime.” For a related discussion, see Marvin (1988).
- 5 Schwarzlose focused primarily on the electric telegraph as a technology; Blondheim on its role in fostering novel organizational forms. My own approach shifts the focus from the electric telegraph to the political economy in which it was embedded. For a related discussion, see Nerone (2008).
 - 6 The Smithsonian exhibit ignored the mail entirely, at least in part because its history was featured in another gallery of the museum.
 - 7 One diplomatic historian (Nickles, 2003) has gone so far as to make the counterfactual claim that the existence of a cable link between Great Britain and the United States might have diminished the likelihood that the United States would have declared war on Great Britain in 1812.
 - 8 The phrase “postal system,” while not unknown at this time, would not become common until mid-century.
 - 9 The Post Office Department influenced electoral politics in the early republic in two distinct ways. First, it created an informational environment that facilitated the nationwide circulation of campaign literature. Second, it provided party leaders with the material incentives – in the form of lucrative offices and contracts – to reward party workers should their candidate prevail. See John (1995, Ch. 6; 2003).
 - 10 The letter-rate reductions mandated by the Post Office Acts of 1845 and 1851 built on, and extended, the highly advantageous newspaper rate structure established by the Post Office Act of 1792. The mid-century postal reform acts hastened a *second* communications revolution; the *first* communications revolution dated from the 1790s.
 - 11 Though the civic rationale for communications regulation in the United States was more expansive than the fiscal rationale for communications regulation in Great Britain, the history of postal reform in Great Britain is far better documented (John, 2010b).
 - 12 The relative unimportance of the railroad to the electric telegraph in the United States in the pre-Civil War era has been recently underscored in an exemplary dissertation by Benjamin Schwantes (2008).
 - 13 Both networks were also dependent on large numbers of semi-skilled workers, a fact that is too often overlooked (Downey, 2002).
 - 14 The characterization of Western Union as a “natural monopoly” provided Thompson with a convenient bookend for his monograph on the early telegraph business. For Chandler, in contrast, the natural monopoly hypothesis enabled him to elide the thorny interpretative issues raised by the continuing competitive challenge that Western Union would in the post-1866 period confront. On the limitations of Chandler’s argument, see DuBoff and Herman (1980). The post-1866 competitive challenge was analyzed by Grodinsky (1957) and underplayed by Klein (1986).
 - 15 The economic benefits of weather reporting can be measured by comparing the number of shipwrecks on the Great Lakes that occurred in periods during which the government’s weather-reporting service was in operation with the number of shipwrecks that occurred in periods during which the service had been suspended (Craft, 1998).
 - 16 The related yet distinct and in some ways antithetical contention that the business strategy of corporate managers shaped the organizational structure of the modern corporation was popularized in the 1960s by business historian Alfred D. Chandler, Jr. Chandler’s contention had the effect, as was its intention, of depoliticizing managerial decision-making. The contention that political structure shaped business strategy, on the

- contrary, highlights the centrality for the history of communications not only of politics, but also of the state. For a related discussion, see John (2008).
- 17 The importance of the competitive period (1894–1907) in hastening the popularization of the telephone has been emphasized by a number of telephone-history revisionists, beginning with R. Gabel (1969), and continuing with Lipartito (1989, 1994, 1997), Mueller (1993, 1997), and D. Gabel (1994). The achievement of these scholars – and, in particular, of Mueller and Lipartito – in directing our attention to this oft-neglected moment in telephone history is undeniable. Yet it is one thing to recognize the significance of this competitive interlude in hastening the popularization of the telephone, and another to discount the influence on telephone popularization of other factors, including, in particular, the investment strategy of big-city Bell operating companies and the political contests over municipal franchises in which these operating companies became embroiled, contests in which rival operating companies almost never posed a major competitive challenge.
 - 18 The best introduction to rate-and-entry regulation in the late nineteenth-century telephone business remains Horwitz (1989). See also Armstrong and Nelles (1986), D. Gabel (1995), and Maguire (2000).
 - 19 The continuing significance of metropolitan networks in communications history is a theme of Graham and Marvin (2001).
 - 20 The mistaken presumption that ordinary citizens preferred flat rates to measured service has been subtly reinforced by the popularity of flat-rate pricing schemes for the users of Internet service providers.
 - 21 The United States–Canada comparison is developed systematically in McDougall (2004). See also Armstrong and Nelles (1986). The Canadian political economy was significantly different from the US political economy and so too were the business strategies of US and Canadian telephone operating companies. For this reason, it is risky to generalize about telephone service in US cities by using evidence drawn from Canadian cities. In *America Calling*, for example, Claude Fischer (1992, pp. 54–56, Ch. 3) relied in part on a recent monograph on Canadian telephone service to generalize about telephone usage patterns in the United States. In so doing, he underestimated the innovativeness of big-city telephone operating companies and exaggerated the agency of female telephone users. A further problem with Fischer’s analysis stemmed from his reliance on American Telephone and Telegraph institutional public service announcements as a proxy for corporate opinion. Unlike the sales-oriented advertisements sponsored by big-city Bell operating companies, these public service announcements were intended neither to expand the market for telephone service, nor to reach the ordinary telephone users who made the vast majority of telephone calls and generated the bulk of Bell’s revenue.
 - 22 The Bell public relations campaign is described in John (2010a, Ch. 11) and Marchand (1998, Ch. 2).

“Quickening Urgency”¹

The Telegraph and Wire Services in 1846–1893

Terhi Rantanen

ABSTRACT

This chapter argues that the history of wire services cannot only be written in a national context. In order to gain a fuller understanding of the origins of wire services and telegraph and submarine cables in any country, we need to include their relationships with their counterparts in other countries. Wire services, by their very nature, were interwoven with one another through the technology they used and across national boundaries. The chapter explores the early stages of development of the telegraph and wire services in the United States and Europe that led to monopolies that were all interconnected: the New York Associated Press’s monopoly on the domestic news market, Western Union’s hegemony on the US market, the European news cartel’s monopoly on the world’s news market, and the cable monopoly over the Atlantic submarine cable.

Pray give some news for New York; they are mad for news.

(Telegram from Newfoundland to Valentia,
August 25, 1856; in Prescott, 1866, p. 198)

Journalism histories are mostly written using a national framework. As Schlesinger (1995) argues, media histories in general and the history of journalism in particular “have an overarching interest in showing how media institutions have contributed to

The International Encyclopedia of Media Studies, First Edition.

the shaping of *nationalist* culture, economics and policy” (pp. 5–6, my emphasis). The writing of nationalized journalism histories is closely related to recent discussions on the problems arising from methodological nationalism in the social sciences, where nation-states are taken as *the* most important starting point for any research. Wimmer and Glick Schiller (2002, p. 307) call this a container model, “in which societies are *imagined* in terms of an isomorphism of culture, polity, economy, territory, and a bounded social group” (Robins, 2006, p. 22, my emphasis).

Journalism historians have accepted their own role as often voluntary and sometimes even eager contributors to the construction of naturalized national media and/or journalism histories, presenting their work as, for example, “US,” “British,” or “Finnish.” This is, of course, important, especially when it is crucial to constructing a democratic narrative of a nation that can present its own unique history against those of other nations. Media and journalism play an important role in this narrative. Carey (1974, pp. 3–4) famously wrote that journalism history has been dominated by a Whig paradigm that reviews it as the history of a slow, steady expansion of freedom, from the political press to the commercial press. Further, as Nerone (1990, p. 16) observes, there is a fairly standard list of complaints that journalism history overemphasizes metropolitan daily newspapers and neglects women, minorities, labor, alternative media, religion, and other groups and topics in order to contribute to a Whig narrative. However, while critical in other respects, both these views take for granted that this narrative is always a national one.

The histories of all wire services are also nationalized, but especially the history of the Associated Press (AP), the oldest cooperative news agency, which still has a dominant position in the US market. For example, Schwarzlose’s (1989, 1990) title is *Nation’s Newsbrokers* and Menahem Blondheim ends his acclaimed book on the early history of the AP by writing:

The Associated Press monopolized telegraphic news gathering and news distribution in *America* in the second half of the nineteenth century. Its structure as a *national* institution – impersonal, non-local, unselfconscious, and hidden – gave wire service news, however partisan, the appearance of objectivity. The Associated Press helped *Americans* accommodate to a common information environment. By giving news that impressed on the minds of *Americans* a *national* orientation, it fostered the integration of *American* society. (Blondheim, 1994, p. 195, my emphasis)

Carey and Nerone’s criticism of this Whig history can also be extended to wire services, where historical writing tends to concentrate on major national institutions that still dominate the market, such as the AP. There is also a tendency to celebrate cooperative ownership as the most democratic form of ownership and morally superior to other forms (e.g., Cooper, 1942). The early history of wire services in the United States is also often written as a narrative, beginning with the New York Associated Press (NYAP) and inevitably leading to the present-day AP. Other services are often ignored or cast as threats to the NYAP and competition is often described in military

terms such as a “war.” Competing services which were soon founded, for example United Press (1882), and which were privately owned, have received much less scholarly attention. This happened in spite of the fact that many of AP’s competitors were in many ways more innovative and radical than AP (Rantanen 1992, 1994, 1998).

While fully acknowledging the value of Blondheim’s (1994) work and that of others (e.g., Gramling, 1969; Rosewater, 1930; Schwarzlose, 1989, 1990), I argue that the history of wire services cannot only be written in a national context. Even their names – wire services in the United States, telegraph (news) agencies in Europe – suggest that their birth was closely related to the invention and use of the telegraph and submarine cables, the first *international* electronic communications technology. Headrick (1990, p. 4) writes that, whereas railroads and electronic power reached their optimum efficiency on a regional scale, telegraph services quickly became national and, in the case of submarine cables, intercontinental and even global. I have elsewhere argued (Rantanen, 2009, pp. 22–23) that internationalization of communication started in the nineteenth century and was preceded by cosmopolitanization of communication in Europe, at a time when news was primarily exchanged within and between cities. With the use of the telegraph, wire services promoted not only the nationalization, but also the internationalization of news – defined as a kind of multiplied nationalization, as the term “international” (between nations) indicates (Rantanen, 2010, p. 27).

The international and the national are not such closed categories as is often thought. As Jill Hills has argued, the very terms “international” and “national” suggest that borders are determinant of policy:

They suggest that one thing happens inside and another outside these borders. But the basis of the current study is that there is no such easy division in the telecommunications field. The international telecommunications market is made up of networks, and networks can and do breach borders. Domestic networks can expand into the international, and the international can expand into the domestic. (Hills, 2007, p. 10)

The two inventions, wire services and the telegraph, are closely interconnected and together challenge the celebration of the progress achieved by exclusively national media. Although it is important to acknowledge that there are factors that can be analyzed as primarily national and thus differing from country to country, it is as important to acknowledge that there are factors that are similar across national borders. Very few communication technologies and institutions have been “founded” only in one country; rather, they have rapidly spread after their invention from one city to the next across national boundaries. This is, of course, what happened with the printing press and newspapers: following the invention of the Gutenbergian press in 1450, 236 towns in Europe had Gutenberg-style presses by 1500 (McNeill & McNeill, 2003, p. 180).

The uniqueness of each of the national wire services has been celebrated many times in company histories and media histories (Blondheim, 1994; Frédérrix, 1959;

Read, 1999; Schwarzlose, 1989, 1990; Storey, 1951). Much has also been written about the significance of telegraph and submarine cables (Ahvenainen, 1981, 1996, 2004; Carey, 1989; Griset, 1996; Headrick, 1990; Headrick & Griset, 2001; Hugill, 1999; Nickles, 2003; Peters, 2006; Standage, 1998; Winseck & Pike, 2007). However, what has not received enough attention is the combination of the four: the *mariage à quatre* between the telegraph and the wire services, domestic and foreign, and their mutual relationships.

In this chapter, I argue that, in order to gain a fuller understanding of the origins of wire services and telegraph and submarine cables in any country, we need to include their relationships with their counterparts in other countries. Wire services, by their very nature, were interwoven with one another through the technology they used and across national boundaries. Earlier research has pointed out that AP's monopoly in the US news market was based on the monopoly shared by Western Union and AP (Blondheim, 1994; Czitrom, 1982; Thompson, 1947). I further argue that we should explore the early stages of development that led to monopolies that were all interconnected: the NYAP's monopoly on the domestic news market, Western Union's hegemony in the US market, the European news cartel's monopoly in the world's news market, and the cable monopoly over the Atlantic submarine cable. However, it is important to note that gaining a monopoly was not easy. The first 50 years of wire services in the United States were ones of constant struggle, of the gaining, maintaining, and losing of monopolies.

Early Pre-Wire and Wire News Services

The fact that media and communications are by nature *transnational* is easily forgotten when constructing their national histories. In a similar way to printing presses and newspapers, news agencies were “invented” almost simultaneously in several cities around the world: Bureau Havas in Paris in 1832, Daniel H. Craig's news service in Halifax (later in Boston) in 1837, Telegraphisches Korrespondenz-Büro B. Wolff in Berlin in 1849, S. Josaphat and Co.'s Continental Telegraph in London in 1851 (from 1865, Reuters' Telegram Company) (Blondheim, 1994, p. 55; Fuchs, 1919, p. 74; Read, 1999, pp. 7–12; Schwarzlose, 1989, p. 22). To give a precise starting year for these organizations is often dubious: in the pre-telegraph era many of them experimented with different forms of transportation and transmission (from pigeons to news boats) in various locations and it is difficult to point to an exact date, name, or even a location. Charles Havas began translating items from domestic and foreign newspapers and was soon delivering news to its clients in European cities. Daniel H. Craig had a regular news reporting service by means of carrier pigeons from Halifax, Nova Scotia (a first stop for British vessels) to Boston (Rosewater, 1930, p. 3), from which New York papers used special trains to bring European news (Gross, 1977, p. 36). Both Julius Reuter and Bernard Wolff worked with Havas, and later they too

founded their own privately owned agencies. Craig was aware of his European counterparts and their use of pigeons for transmitting messages (Gramling, 1969, p. 12). In this way, the operations of all these services were also, from their earliest beginnings, transnational.

Unlike early European wire services, which were either in private or government ownership, many, but not all, wire services in the United States were cooperative. Among the early cooperative organizations was the New York State Associated Press, founded in 1846 by newspapers in Albany, Troy, Syracuse, Auburn, Rochester, Buffalo, and Utica. It installed agents in Albany and New York to transmit news from these cities (Gross, 1977, p. 42, Schwarzlose, 1980, p. 54). The Harbor News Association was also founded in 1846, when New York City newspapers formed an alliance to share the cost of collecting news by means of “news boats” which met incoming ships from Europe. Another early enterprise was organized, again by New York papers and also in 1846, to deliver news of the Mexican war by pony express from Mobile to Montgomery, Alabama. All these associations have been seen as early forms of what was later called the Associated Press, although it is not entirely certain when the New York association started using this name. What we do know is that in 1848 six New York newspapers combined their news-gathering operations under the name of the New York Associated Press and proposed to a telegraph company a permanent set of schemes and rates (Blondheim, 1994, pp. 49–50; Knights, 1967, p. 9; Schwarzlose, 1989, pp. 94, 101). It is important to note that no paper outside New York was included in any of these arrangements (Thompson, 1947, p. 225).

These pioneer ventures were primarily attempts to organize foreign news transmission. From its early days the NYAP was connected to Reuters’ agency in London. Even before the first Atlantic cable became operational, the NYAP had established a steamer news exchange arrangement with Reuters in 1857 (Desmond, 1978, p. 162) and the two concluded a formal agreement in 1861.² Through this contract with Reuters, the NYAP established its first contract with Havas and Wolff. In 1866, the NYAP opened its bureau in London and news from Havas and Wolff began to be transmitted through London (Basse, 1991, p. 38).

Despite their different ownership forms and locations, all wire services around the world came to share one similarity: they soon started to use the latest communications technology, the telegraph and submarine cables. In the most general terms, with the availability and use of the telegraph, former news agencies became wire services/telegraph agencies that could be defined as companies using the telegraph to collect and transmit news. They combined news, an earlier invention, with the telegraph and thus invented something new, telegraph news. However, even if they used the same technology, the control and ownership of the telegraph varied significantly between Europe and the United States. While in Europe the telegraph was owned by the state, in the United States it was in private ownership (Du Boff, 1984, p. 63). Apart from Reuter and Craig, most wire service owners did not own or invest in transmission technology, but instead rented lines or negotiated special fees for the transmission of their news telegrams.

The Inland Telegraph and Wire Services

The establishment of wire services was closely connected with the establishment of the telegraph. Their mutual dependency cannot be ignored in understanding their growth. In short, without the spread of the telegraph, wire services could not expand their operations. This is why it is important to explore their interconnectedness and show how it affected their business models even if their businesses remained in most cases separate.

Early telegraph companies in the United States were small and were run mainly on local and regional lines. The first telegraph line was built in the spring of 1844 between Washington and Baltimore and was rapidly extended to other cities. Newspapers published in towns and cities located along the new lines soon began to use the telegraph. The first telegraph news appeared in the New York City papers in early May 1846, before the city was even fully wired to the cities from which the dispatches originated (Schwarzlose, 1990, pp. 38–39, 57). By the summer of 1846, the telegraph lines stretched from Washington, south from Buffalo, and west from Boston and connected in New York, and were thus transformed into a network. However, because of the large number of local companies, a single message from Halifax to New York had to pass over the wires of five different companies, each employing different procedures, separate accounts, and varying policies (Blondheim, 1994, p. 55).

Although the NYAP itself considered buying a telegraph line, it was decided that this was outside the association's business (Schwarzlose, 1990, 194). However, Craig invested in several telegraph lines, including the New York, Newfoundland, and London Telegraph Line Company, between New York and Cape Race, Newfoundland, which was later used by the NYAP (Knights, 1997, p. 10). One of the first contracts of the New York Associated Press was with the New York and Mississippi Valley Printing Telegraph Company, which changed its name in 1856 to Western Union (Schwarzlose, 1990, pp. 188–189). The NYAP also used the New York–Cape Race, Newfoundland line to receive dispatches from Europe once these had arrived by steamer in Canadian ports (Knights, 1967, p. 10).

As Czitrom (Czitrom, 1982, p. 17) observes, disconnected and uncoordinated lines, the great expense of early telegraphy, inadequate facilities, inexperienced operators, and fierce competition for the use of the few existing wires made the period from 1846 to 1849 a chaotic one for both press and telegraph companies. At the beginning of 1851 there were still more than 50 separate telegraph organizations in the United States (Du Boff, 1984, p. 7). Du Boff remarks that the early years of the telegraph were fiercely competitive and the newly founded companies soon started creating their own “telegraph empires” and trying to penetrate each other's territories (p. 54), the model wire services adopted from them.

In a similar way to the telegraph, wire services started locally. Owens (1927, p. 385) argues that before the early 1890s the AP was not an incorporated body, but

merely a combination of newspapers and small news associations loosely held together by a written agreement for the exchange of news. There was the New York State Associated Press (1846), which preceded New York City activity by at least two months (Schwarzlose, 1980, p. 562) and was founded in 1846. Other similar associations elsewhere followed: Boston Associated Press was established in April 1848 (Schwarzlose, 1990, p. 106), Western Associated Press (1862), and the New England Associated Press, the Kansas and Missouri Associated Press, the Southern Associated Press (Gross, 1977, p. 44; Thompson, 1947, p. 225; UNESCO, 1953, p. 12), but there is much less research available on these organizations.

The “authorized history,”³ the web version of the AP company history, starts from the year 1846, when *The New York Sun* established an arrangement whereby Mexican war reports arriving by boat at Mobile, Alabama, were rushed by special pony express to Montgomery, then 700 miles by US mail stagecoach to the southern terminus of the telegraph near Richmond, Virginia. That express gave the *Sun* an edge of 24 hours or more on papers using the regular mail. Four more New York papers were invited to join in the arrangement: *The Journal of Commerce*, *The Courier and Enquirer*, *The Herald*, and *The Express*. In May 1846, the offer to share news from the US war with Mexico was extended to rival newspapers. The resulting agreement formed the basis for cooperative news gathering by telegraph, just as the telegraph began a swift expansion throughout the country, linking New York to other telegraph nodes (Pyle, 2006).

Another agreement dates from 1848, when five New York papers, *The Journal of Commerce*, *The Courier and Enquirer*, *The New York Sun*, *The Herald* and *The Express*, formed the Harbor News Association in order to operate a small fleet of news boats to get foreign news from arriving ships. The Naushon (or Newsboy) steamship would meet the ships at Sandy Hook. Later a second Harbor News Association was re-chartered to include *The New York Tribune* and a more formal framework for cooperation.⁴ Its management rotated among the partners, with each newspaper in turn assuming responsibility for one month. In the early stages of telegraphic news gathering, responsibility for procuring foreign news also apparently rotated among the members of an association (Blondheim, 1994, pp. 103–4). The New York Associated Press was formalized in 1851, when seven New York papers signed an agreement for the joint telegraphic transmission of news.⁵ By 1866, daily newspaper editors were receiving national and international news primarily by telegraph. Most of them bought it directly or indirectly from NYAP (Blondheim, 1994, pp. 145–146).

Monopolies in Technology and News

The cooperative form of ownership, while celebrating its democratic, non-profit nature, is simultaneously based on a principle of exclusivity whereby membership is strictly limited and the exchange of news can only take place between members. The Association’s formal regulations from 1856 stated:

All telegraphic news, with certain stated exceptions, was to be available to all members. No new members were to be admitted without unanimous consent. News obtained by the members or their agents might be sold to other parties for the general benefit of the Association. (Rosewater, 1930, p. 381)

Another exclusive agreement was made between the NYAP and a telegraph company. By 1860, the American Telegraph Company had obtained an exclusive right to transmit NYAP news (Knights, 1967, p. 10). In 1861 its competitor, Western Union, completed the first transcontinental telegraph line, connecting New York and Sacramento, California, through St. Joseph, Missouri. According to Blondheim (1994, p. 145), Western Union was now well positioned for the increased importance of cross-country communication and strengthened the Chicago-centered, East–West-oriented system. As Du Boff (1984) observes, it was completion of the transcontinental telegraph in 1861 and the prospect of a successful Atlantic cable that touched off renewed rivalry between Western Union and the American Telegraph Company. A new company, the United States Telegraph Company, financed by a group of New York City businessmen, started in 1864. After an intensive period of competition, Western Union swallowed up its last two rivals and became a national monopoly by late June, 1866 (Knights, 1967, p. 7). By 1866 the Western Union monopoly controlled 90% of the telegraph traffic in the United States.⁶

After Western Union became the NYAP's exclusive partner, the latter started occupying space in the Western Union building at 145 and later at 195 Broadway in New York, where it remained until 1914 (except for a brief period in the 1890s; Schwarzlose, 1990, p. 223). The NYAP's close relationship with Western Union contributed to what Blondheim (1994, p. 143) calls a double-headed monopoly. Both companies would establish this monopoly in their respective but tightly linked markets, and it persisted for another 15 years. It was a combined news–telegraph monopoly and supplied most of the United States with its telegraphic news (Blondheim, 1994, p. 131).

The Atlantic Cable and News

Between 1850 and 1870 submarine cable technology grew from infancy to maturity (Headrick, 1990, p. 24). However, although inland telegraph and submarine cables diverged in terms of their ownership and organization, they had to be connected to each other. Hills (2007) calls one of the arrangements a “Western Union model” (pp. 25–28), whereby international networks owned by foreign companies are stopped at borders, while those owned by domestic companies penetrate the borders. Inland telegraph companies in Europe were owned by the state, while in the United States they were private and cable companies were mostly private, with the exception of two “imperial” British transatlantic cables (Brown, 1927, p. 122). However, all these different systems had to find ways to compete against and collaborate with each other.

Western Union's competitor, the American Telegraph Company, had invested heavily in the first Atlantic cable, which stopped working a couple of weeks after it was opened in 1858 (Prescott, 1866, pp. 205–206). After several unsuccessful attempts, another company, the Anglo-American Telegraph Company, finally laid an Atlantic cable that started working in July 1866 between Valencia Bay (Ireland) and Newfoundland. Although not itself involved with the cable, Western Union was well positioned for the increased importance of cross-country communication. Whereas the Atlantic cable, the great hope of the American Telegraph Company, was put on hold during the war years, Western Union's pet project, the overland telegraph to the West coast, had been completed in 1861 (Blondheim, 1994, p. 145).

Another factor that further strengthened the position of the US telegraph companies, although they did not own the first transatlantic cables, was that for the most part they came under the control of Western Union and the Commercial Cable Company (co-funded by Gordon Bennett of *The New York Herald*). These two companies, both of New York, also owned, directly or through affiliated companies, the land telegraph system of the United States and in part of Canada (Brown, 1927, p. 9). Two British cable companies, which had laid and operated a number of Anglo-American cables, had to depend on their US competitors for the provision of facilities for the collection and delivery of their traffic throughout the United States. As a result, the British companies' position became so difficult that they were eventually driven to lease their cables for a period of 99 years to Western Union (Mance, 1943, p. 63).

Wire service owners bought the services from telegraph companies, but rarely invested in them. However, there was one notable exception: Julius Reuter, who in 1866 had organized a cable from Lowestoft in the UK to Norderney in Germany,⁷ teamed up with the French financier Baron Emile Erlanger to establish the Société du Câble Transatlantique Français, which laid a cable from Brest to Duxbury, Massachusetts, via the island of St. Pierre (Parkinson, 1870, p. 25). In 1871 they joined the Anglo-American Telegraph Company in a *joint purse* or cartel, by which they agreed to charge the same rate and divide the income in proportion to their traffic. This gave the partners in the cartel the security to protect their interests but deprived them of the possibility of attracting customers by lowering their rates (Headrick & Grisct, 2001, pp. 554–555). Interestingly, the *joint purse* term was also used in 1869 when Reuter and Havas signed an agreement between themselves which stipulated that profits from all sources would be divided equally between them (Rantanen, 1990, p. 41). After two years the Société du Câble Transatlantique Français was sold to the Anglo-American Telegraph Company. As Headrick (1990, p. 25) points out, the new cable route, which began as a monopoly, turned into a cartel.

Newspapers were early, but not the only, users of the telegraph. In the beginning, long-distance telegraph rates were staggeringly high. In 1866, the charges for the transmission of messages were described "as beyond the reach of all but the most wealthy capitalists or combinations."⁸ The charge for 20 words was £20 sterling – a sum equivalent to US \$150 today, or two months' wages at that time for an industrial worker (Headrick, 1990, p. 4). However, when the second Atlantic cable successfully

began operating in 1866, newspapers used it almost immediately. The “ordinary” telegram traffic was always the most important source of revenue for the cable and wireless companies, but at an early stage a separate price category was introduced for press telegrams. These, usually of considerable length, were sent in plain language and were less costly for cable companies to deal with than ordinary commercial telegrams. Moreover, the companies usually reserved the right to send them when the lines were clear of other traffic (Brown, 1927, pp. 132–133). However, due to the cost of cable transmission, foreign news was the most expensive to gather, and its supply was an important source of the NYAP’s dominance in the collation of press associations (Blondheim, 1994, p. 159).

European News Agencies

By the time the first Atlantic cable started operating in 1866 and connected the NYAP with European telegraph agencies, Havas in Paris, Wolff in Berlin, and Reuter in London had already started to expand their activities across national borders. They had three strategies in expanding their activities: (1) founding branch offices; (2) funding or buying agencies outside their home countries; (3) selling their news to other news agencies, newspapers, and other clients.

In the early days, the agencies operated freely across borders. Havas, for example, founded offices in Augsburg, Wurtzburg, and Stuttgart (Frédérrix, 1959, p. 77; Storey, 1951, pp. 39–42). Reuter tried to buy other private agencies, for example Stefani in Rome and Ritzau in Copenhagen (Read, 1999, p. 54). Wolff and Reuter both tried to establish contacts in St. Petersburg and Moscow (Rantanen, 1990, pp. 82–83). In 1866 Reuters was still competing against Wolff in its home market: Reuter founded *Telegraphenbüro für Norddeutschland*, with branch offices in Berlin, Hamburg, and other German cities (Fuchs, 1919, p. 83). Wolff also “helped” to get new telegraph agencies started: Ritzau in Copenhagen in 1866, *Svenska telegrambyrå* in Stockholm in 1867, and *Norsk Telegrambureau* in Kristiania in 1867 (Berg, 1952, pp. 25–29; Fuchs, 1919, p. 86).

Gradually the three agencies started to make contracts to collaborate, but also to achieve territorial monopolies through exclusive agreements. The first contract was between Havas and Reuter in 1856 and only concerned commercial news, but the first agreement between Havas, Reuter, and Wolff was concluded in 1859. According to this latter agreement, Havas was to transmit to Wolff – as it already did to Reuter – its telegrams from France, Spain, Italy, and the Levant. Wolff, for his part, undertook to deliver telegrams from Germany, Russia, the Slavic countries, and Scandinavia. The agreement was a cost-free exchange of news among the concluding parties, in the same way as in cooperative wire services. It was also exclusive: the parties agreed not to deliver to agencies that were not signatories to the agreement (Rantanen, 1990, p. 39). In 1865, Reuter signed an agreement with Wolff in which he undertook

to provide Wolff with news from New York (Rantanen, 1990, p. 40). Reuter could only provide news from New York because of his agreement with the New York Associated Press, concluded in 1861/1862.⁹

The European News Cartel and Wire Services in the United States

The NYAP agreement with Reuter became an issue in the so-called US press war of 1866–1867 (Blondheim, 1994; Knights, 1967; Rosewater, 1930; Schwarzlose, 1990). After a period of competition between Wolff and Reuters elsewhere, it was in the US market that they again competed against each other. By 1866, the NYAP was the only wire service serving the whole country (Knights, 1967, p. 1). With its exclusive contract with Reuters and Western Union, it was geographically placed such that it could establish a linkage with the Atlantic cable and serve as the terminal point for overland telegraph communications (Swindler, 1946, p. 44). This soon became apparent to Western Associated Press (WAP). Forced to buy all its news from the NYAP, it had to cover two-thirds of the expenses; the NYAP papers paid only one-third, while the WAP and the other two groups, New England, Philadelphia, and Baltimore and the South, paid the remaining two-thirds (Knights, 1967, p. 17; Swindler, 1946, p. 44; Western Associated Press, 1870, p. 15). WAP complained that the news was not only overpriced, but also did not even fulfil its members' requirements. They complained that "fully one-third of these European telegrams are devoted to announcing the arrival and departure of New York steamers, and disasters to New York mercantile sail and steam vessels in all the waters of the old world, being items of special interest to the shipping interests of the port of New York, but of inferior value to the public outside of New York" (Knights, 1967, p. 22).

In an attempt to cut their costs, the NYAP had turned down Reuters' offer of an agreement as too expensive. Craig, in an attempt to become the "Reuter of America," had founded a private company, the United States and European News Association, in 1866 (Knights, 1967, p. 19). Through this, WAP temporarily achieved an exclusive agreement with Reuters. This probably formed the backdrop for the NYAP to make its agreement with Wolff, which was also eager to get a foothold in the US market. Wolff had bitterly resented Reuters' incursion into German territory through the Norderney Cable Company and now refused to join the Reuter–Havas–NYAP agreement of 1867 (Desmond, 1937, pp. 221–222; Fuchs, 1919, p. 82; Read, 1999, p. 56; Williams, 1953, p. 23). After a period of intensive domestic competition, the Reuters agreement was shifted back to the New York Associated Press (Schwarzlose, 1990, p. 50).¹⁰

The Reuters agreement with the NYAP was significant in two ways. First, it restored the NYAP's predominance as the sole agency empowered to deliver foreign news to the other AP members¹¹. NYAP's contract with Reuters was exclusive, i.e., no other wire service in the United States could receive news from Reuters. Second,

with this agreement with the NYAP, Reuters became the exclusive partner with NYAP in its agreement with Havas and Wolff in 1870. Although North America was formally divided between Havas, Wolff, and Reuter, it was Reuters that delivered news from two other agencies to the NYAP. Existing scholarship does not cite an extant copy of the 1867 agreement between the NYAP and Reuters, but its year matches the expiration prescribed by the 1861 contract and it is mentioned in Reuters' Minute Book of 1867.¹²

Not until 1870 did the three European agencies sign a collective agreement with AP, which recognized North America as a common territory for Havas, Reuters and Wolff.¹³ This agreement explicitly annulled the contract between Wolff and NYAP. The financial terms of the agreement were very different from the 1861/1862 contract with Reuters: both sides were now to pay all transmission expenses. Since the number of telegrams was much higher from Reuters, Wolff, and Havas, the NYAP had to deliver far higher cable tolls. In addition the NYAP had to pay an annual commission (£2,400). The agreement was exclusive and the contracting parties were not allowed to deliver their news to any other persons or newspapers (Rantanen, 1990, pp. 48–49).

The NYAP monopoly did not last very long. By the late 1870s the NYAP, WAP, and Western Union were again dissatisfied (Blondheim, 1994, pp. 150–151, 163). The rise of a new telegraph company, the Postal Telegraph Company, made competition possible again. The United Press (UP), a private wire service, was founded in 1882. UP, however, could only obtain foreign news from agencies outside the European news cartel. Thus it signed an agreement with the Central News Agency, a minor competitor of Reuters in London. UP and WAP now negotiated over ways to divide the US news market between themselves (Rosewater, 1930, p. 200). According to this agreement, UP was in undisputed control of all the territory east of the Alleghany Mountains and north of Virginia, while the Western territory was controlled by WAP. In addition, no newspapers served by AP news reports were to traffic with any rival association (Associated Press, 1893; Swindler, 1946, pp. 52–53) and then sign a joint agreement with Reuters. But these negotiations collapsed in 1892. Simultaneously, a new organization, the Associated Press (of Illinois), was founded, with Melville Stone as its general manager. At first, both agencies attempted to sever the other's access to foreign news by seeking exclusive rights to cartel news; both sent representatives to Reuters to negotiate an exclusive contract. To quote Frédérrix (1959, p. 190), the result was total chaos in New York, Chicago, London, and Paris.

Although both UP and AP claimed to have “won” the race for exclusive rights, it was actually the AP of Illinois that gained the final agreement with the European news cartel. But the price was high: it had to pay £3,500 annually (originally planned as the commission from two agencies) – the highest sum ever. Still, this contract dealt a decisive blow to UP: by 1899, after AP had spent a million dollars, it had succeeded in driving UP out of business. Baron Herbert Reuter telegraphed congratulations to AP on having established a monopoly in the United States (Fenby, 1985, p. 39).¹⁴

It is no accident that the subsequent cartel agreement of 1898 for the first time mentions AP as their counterpart in the United States. Scholars have therefore been correct in concluding that in 1893 AP bought exclusive rights from the cartel for foreign news in the United States. It is *not* correct, however, to assume that AP also acquired exclusive rights to its home country, which, *de jure*, still belonged to the European news cartel. In fact, AP was able to maintain a domestic monopoly only until 1907, when a new competitor, the United Press Association, was founded.

Conclusion

This chapter has argued that the telegraph fundamentally changed the transmission of news. The telegraph created first a local, then a national, and finally an international electronic network for the exchange of news. The wires often followed established roads or railways, but the cables also created new routes connecting continents separated by seas. The telegraph created a new electronic space that could be used not only for private, but also for public communication. The first wire services, telegraph agencies, followed the expansion of telegraph lines and cables by using them for the transmission of electronic news that could be multiplied by sending the same item simultaneously to several places. The wire services established their offices in the proximity of major telegraph stations and/or stock exchanges, which were the first users of the telegraph. They sold news items to customers including newspapers, which edited and published their news, and other clients.

The wire services were established in cities with multiple connections that later became electronic news hubs. The concentration of printed media, the telegraph, the stock exchanges, and the new wire services contributed to changing these hubs into electronic news capitals. They were often, but not always, capitals of their respective nation-states or harbor cities. Some of them even became global news capitals that gradually were more connected to other global news capitals than to other places in their own respective nation-states.

In this chapter I have argued that we cannot study the early history of any wire service without taking into account its domestic and foreign relations. These relations include both the relation to technology providers, foreign and domestic telegraph companies, and other domestic and foreign wire services. The very essence of wire operations was to provide content (news) to customers (newspapers and other agencies) using the latest technology of the time: the telegraph and submarine cables.

I have shown that, both in technology and in the electronic news industry, there was an attempt to achieve a spatial monopoly. Western Union achieved a monopoly over inland telegraph lines; British and US cable companies achieved a monopoly over Atlantic cables; the European electronic news cartel, and especially Reuters, achieved a monopoly on the US and subsequently on the world news market; Associated Press

achieved a monopoly on the US market. These monopolies were interconnected and dependent on each other. Their formation was complex and complicated. They faced internal and external competition and did not last indefinitely. But when the monopolies were all in force at the same time they were difficult to break.

Western Union's domestic monopoly would not have been possible without the Atlantic cable. The AP monopoly would not have been possible without its contract with Western Union and Reuters. The European news cartel's monopoly (and especially Reuters') on the world market would not have been possible without its contract with AP and with cable companies. The Atlantic cable companies would not have had their monopoly without their arrangements with inland telegraph companies that were also monopolistic.

As Innis (1964) has pointed out, monopolies are created over both time and space. The telegraph and submarine cables created a new market, where getting the news first became a crucial factor in competing against other newspapers. However, as with every new technology, the price of using it in its early days was high. To achieve a spatial monopoly, newspapers made agreements with each other to share the costs. It was New York and the East coast of the United States that had a spatial monopoly over electronic news. This happened primarily because of their strategic position as a news gateway to Europe based on harbor cities and cable landings. There was also continuity and even overlapping between transportation and transmission, ships and cables, trains and telegraph poles.

The fact that the AP domestic monopoly was only achieved in 1893 shows how difficult achieving and maintaining a monopoly is. Even that monopoly did not last long: when the United Press Association was founded in 1907 it soon started challenging the AP monopoly. The availability and increase in the use of wireless telegraph and radio challenged the power of the European news cartel, which was technologically based on the control of the telegraph by the respective nation-states. Among the agencies that rose to resist the cartel were the Associated Press and United Press, who used the wireless and formed alliances with other agencies subordinated to the cartel.

Eventually, after World War I, the telegraph monopoly was brought down by the wireless, and by 1934 the European news cartel monopoly had been broken by AP and the UPI in collaboration with other agencies. By that time, old news monopolies had served their purpose and gave way to "free" competition that was laid on the inherited structures of the former. As a result, after World War II, London, Paris, and New York became the leading global news capitals of the world.

Photography

Craig Robertson

ABSTRACT

This chapter provides an overview of the contested emergence of photography in the second half of the nineteenth century. In the field of media studies, photography is often positioned to provide a critique of historically specific modes of understanding and representation. Viewed as a medium, photography and its early development offers important insights into various debates about evidence, truth, and authenticity, and more generally modernity. The chapter reviews examples of photography's contested emergence in the United States from the world of portraiture, the courtroom, immigration enforcement, and journalism. In most of these cases photographs provided an initial challenge to the authority of the word (both spoken and written). The examples also illustrate that whether it is linked to understandings of personal identity, citizenship, national identity and democracy, or capitalism, consumption, and mass culture, the complicated set of practices associated with photography provides important examples of how the present of the nineteenth century was imagined and interrogated as new.

While it is often stated that photography was invented in 1839 it is more accurate to posit that photography emerged in the nineteenth century. Invoking 1839 refers to the year that Daguerre made his photographic process public. He sold his invention to the French government, which led to the spread and development of daguerreotypes. These were images that could not be reproduced and initially

required more than 30-minute exposures, although, within a few years, this was reduced to less than a minute. Not only were there clear precursors to this, but, contemporary with it, William Henry Fox Talbot invented the forerunner to photographic prints. In 1841, he patented the calotype, later called the Talbotype. This was a negative/positive process with 5-minute exposure time that allowed for multiple reproductions of an image. Over the next half-century significant technical developments occurred: dry plates, flexible film, faster lenses, and handheld cameras. The result was that by the time of the launch of the first Kodak camera in 1888 practices we could recognize today as photography had come into existence. At the same time the halftone process was invented, which allowed for the reproduction of photographs in printed publications.

There are numerous ways to think about photography: as image, a history of techniques, the work of certain practitioners, and as sociohistorical evidence. In media history the somewhat limited attention to photography has tended to favor the analysis of its social use over a formalist critique of images or its technological development. The focus in media history on the practice or function of photography owes a debt to the social history of photography that emerged in the 1970s, notably in the early Marxist work of Allan Sekula (1984, 2002) and in John Tagg's (1988) Foucauldian iteration. In this approach photography as an articulation of institutional practices and power structures becomes the primary field of study.

The relationship between journalism and photography has dominated the analysis of photography in US media history and contemporary media analysis. This is best represented in Bonnie Brennen and Hanno Hardt's landmark collection *Picturing the Past* (1999). The essays in this volume question the status of photographs as journalistic documentation. The focus of the book skews toward photography and the "documentary" understanding both in terms of collective memory and historical evidence. Cumulatively the book draws from the social history of photography and the general critique of representation as a historically contingent construction. For Brennen and Hardt (1999), "it is not the production of the photograph but the context of social relations, with its practices of making meaning and rendering interpretations, that becomes the appropriate terrain for contemporary observers" (p. 10). This leads them to frame the analysis of photographs in terms of photography as "material culture" or a "regime of truth."

More broadly the analysis of the development of photography as a medium in the nineteenth century is usually articulated to debates over modernity, not modernism. This is the modernity that transformed the economy through new forms of production, expanded industrialization, and encompassed the growth of cities. It was the context that saw the emergence and rapid expansion of democracy, nationalism, capitalism, and consumerism.

Emerging in this era of change many believed that photography gave reassurance that the world could still be known and understood. Dominant popular tropes that introduced photography were that of the "mirror" and "nature." The early photographic pioneers insisted that photography "originated in nature and was disclosed

by nature” (Marien, 1997, p. 3). This idea was continued in claims that photography was “discovered,” a natural phenomenon not a process invented by humans. As Mary Warner Marien (1997) notes, “photography as natural vision was easily transmuted into photography as neutral vision” (p. 5). Along with the analogy of the “mirror,” the invocation of nature drew from parallels with sight to convey the idea that photography had a consistent, accurate relationship to the world it recorded. However, the knowledge that it revealed was not always automatically accepted. Photography as the “mirror with a memory” encountered preexisting visual techniques and practices and also the argument that the photographer and the conditions of production he or she worked in produced photographs that were not quite a copy or an actuality. In this sense photography is often analyzed through denotation and connotation. In the former photography is critiqued in terms of its “indexicality,” its power to capture reality as “it is,” representation that operates “at least in the first instance [...] before any convention or rules” (Batchen, 1997, p. 195; Zelizer, 2006, pp. 4–5). Connotation suggests that the meaning of an image draws not only from what is depicted (photographic realism) but also from broader symbolic systems.

Viewed as a medium, photography and its early development offers important insights into various debates about evidence, truth, and authenticity. Focusing on the tension between photography as mirror or artifice, this chapter offers examples of photography’s contested emergence in the United States from the courtroom, immigration enforcement, and journalism; therefore it has a bias toward photographic images of people. In all these cases photographs provided an initial challenge to the authority of the word (both spoken and written). Photography also called into question existing attitudes about the role of images as relevant forms of representation. The contested authority granted to the visual representation of knowledge, its truth claims, provides an important framework for the analysis of photography’s arrival. Photographic realism was rarely completely rejected, even after practical problems led to a questioning of the idea that a single, consistent point of view existed. In contrast with other technologies used to describe and record, photographs still produced results that were relatively more exact and seen to be, if not accurate, at least somewhat successful approximations of reality.

Photography emerged in an era of burgeoning claims to scientific objectivity. Despite questions about the nature of photography as an unmediated depiction of reality it offered a useful articulation of positivism. In this specific articulation of modernity, claims to realistic representation became the championing of positivism and empiricism. Progress was increasingly seen to be dependent on “facts” collected through the scientific method, in an ordered manner; a well-known and ordered society would be a more equal society. Photography, particularly its perceived fusion of technology and nature, came to play an important role in making manifest the possibility of objective truth.

While positivism provides an important support for claims to photographic accuracy, as media scholar Barbie Zelizer (2006) reminds us, photographic “images work differently in the contexts that put them to work. They adopt and adapt to the

attributes of the domain into which they are imported, and they do so by putting indexicality into the service of the different aims and meanings that are relevant to each domain” (p. 5). The utility of photographs as a standard to assess truth was not consistently agreed upon in the nineteenth century. Positivism was arguably a regular contributor to the constitution of photographs as an object of meaning. However, indexicality was disputed at local levels, often in pragmatic ways with limited resolutions. Photographs were granted meaning in different ways. Their articulation to the material, institutional, ideological, and discursive constitutes photographic practice. While journalism and various forms of the nineteenth-century state define the “local” for three of the following examples, the chapter begins where most people initially came upon photography – the practices of portraiture.

Portraits

In the United States people tended to first encounter photographic portraits through the phenomenally successful daguerreotype. It produced a unique picture directly onto a polished silver-coated plate. As a positive image without a negative the daguerreotype was extremely fragile. It was protected in a case like a piece of jewelry. In the 1840s it became the most successful commercial concern in the United States, with citizens spending \$8–12 million a year on daguerreotypes; by the mid-1850s, with the phenomenon lagging a little, an estimated 3 million daguerreotypes were still produced, selling at two for 25c (Tagg, 1988, pp. 42–43). When paper prints could be produced from glass negatives the *carte-de-visite* became another way in which people obtained portraits. This was a photographic visiting card 2 × 4 inches.

The popularity of daguerreotypes and *cartes-de-visite* extended the possibility of possessing a portrait beyond the art world of an elite group. This was celebrated as a democratization of representation in which photography, imbued with ideas of educational uplift, functioned as a proxy for democracy (Marien, 1997, pp. 72–73). However, in its various guises, the social history of photography has tempered this celebration. Historians have located the daguerreotype, in particular, in aspects of modernity other than democracy. Articulating this argument, cultural historian Alan Trachtenberg (2008) contends that it is important to acknowledge that photography emerged “as a representational practice within a culture undergoing unsettling change toward market-centered urban industrial capitalism” (p. 49). For him the daguerrean portrait quickly emerged as a “habitual commodity” (Trachtenberg, 1992, p. 186). Rather than a challenge to art as an indicator of social status, photography is positioned as introducing the visual as a form of mass consumption.

While people accessed photographic portraits as a commodity, this should not take away the excitement and uncertainty associated with the novelty of the relatively instant conversion of experience into image, into an object. The nature of the daguerreotype accentuated this novelty. The image could only be seen at a certain

angle, producing the oft-commented on “flickering mirror effect.” The response, at least in published commentary, was a “mixed discourse of science, technique, art, and magic” (Trachtenberg, 2008, p. 172). This mechanically produced material image was frequently described as something closer to the materialization of someone, a manifestation more than a copy. Photography as a fusion of nature and technology became “an important proxy” (Marien, 1997, pp. 72–73) for the effects of science and technology on social life. Some early critics read the perceived accuracy of a mechanically produced image through an early iteration of a critique of mass culture. The portraits by camera, along with landscapes, were viewed as blunting creativity, as separating people from direct experience with nature.

Many of those who produced daguerreotypes entered the debate about the status of photography by trying to move it away from something primarily associated with the marketplace (or for that matter science). By the 1850s a “profession” emerged with national journals, associations, competitions, and awards. This existed both to try and marginalize those “quacks” with limited ability and to identify skilled practitioners as artists. It was in the creation of portraits that early photographers primarily came to think of themselves as artists, invoking in part the history of portraiture (Trachtenberg, 2008, p. 73).

While daguerreotypes and cartes-de-visite greatly increased the number of people who had access to portraits, they did not offer a significant challenge to preexisting portrait traditions. In fact, despite the claim that photography offered an unmediated depiction of reality, the accuracy of early photographic portraits depended on an understanding of “likeness” borrowed from a long tradition of painted portraits. To be seen as real, to be seen as indexical, photographs had to follow a set of protocols. Trachtenberg (1992) argues that the portrait as a camera image was made to “resemble a resemblance, to give an effect of likeness” (p. 187). This was achieved “only under controls (focus, framing, lighting) derived from a formula of likeness” (p. 187) taken from an adjacent formal system of representation in portraiture. Posture and expression were critical to the construction of this resemblance.

Numerous guides existed for daguerreotype portraits. It was assumed that photographic portraits could reveal the true character of the sitter if the photographer paid attention to position and pose. The guides drew from the popular pseudo-sciences of physiognomy and phrenology. Physiognomy sought to establish a person’s character through external appearance, particularly the face and profile. More popular in the United States was phrenology, which argued that the personality traits of a person could be derived from the shape of their skull. As Trachtenberg (2008) contends “the popular ideology assumed (or desired) a transparent relation between face and character, between expression and truth” (p. 67).

Visual rhetorician Cara Finnegan’s (2005) analysis of letters to *McClure’s* in response to its publication in 1895 of an early photograph of Abraham Lincoln illustrates the unquestioned assumption that a person’s face revealed their character. Popular understandings of physiognomy and phrenology constituted an “image vernacular” – a specific yet implicit way to talk about photographs that had solidified by the time photography became reproducible on a mass scale barely half a century after its first

appearance as a unique image (Finnegan, 2005, p. 34). In the words of one reader, the image of Lincoln provided “valuable evidence as to his natural traits” (p. 40). His eyes signaled a “great heart”; his expression revealed “just purposes” and “unflinching determination” (p. 46). Summarizing one detailed letter, Finnegan writes Lincoln at a young age was “recognized” as a “man who can be relied upon to make the right decisions, a man who is thoughtful, determined, kind” (p. 46).

In this manner it has been argued that through physiognomy and phrenology photography fostered bourgeois notions of the self, which were frequently articulated to ideas of “American” identity. A regularly cited example of this is Mathew Brady’s large daguerreotypes on display in his galleries, many of which were subsequently published as *Gallery of Illustrious Americans*. Images such as these have been positioned by historians as something for the public to emulate, “a space for viewing men in the guise of republican virtue: gravitas, dignitas, fides” (Trachtenberg, 1989, p. 48). As photography emerged, the portrait tradition that it drew from came to function as “citizenship training of a sort, offering a democratic space for viewing a democratic art that paradoxically perpetuated elitist definitions of virtue” (Finnegan, 2005, p. 42). These elitist definitions were primarily manifest in the “cultivated asymmetries of aristocratic posture” (Tagg, 1988, p. 36) in which “pose is a function of leisure, and frontality signifies its lack” (Lalvani, 1998, p. 449). Through photographic portraiture “in the course of the nineteenth century, the burden of frontality was passed on down the social hierarchy, as the middle class secured their cultural hegemony” (Tagg, 1988, p. 36).

While “honorific” portrait photography in the form of a relatively cheap commodity that borrowed the signifiers of aristocratic portraiture arguably represented the rise of the middle class, another form of portrait photography emerged to represent a different segment of the population. As with “honorific” portraits, these “repressive” portraits drew on phrenology and physiognomy. However, because of the status of its subjects (e.g., the criminal, the insane) the latter was organized around a frontal image of head and shoulders. The ideal form of the repressive portrait became what we now know as the “mug shot.” French police used daguerreotypes to produce an early version of the mug shot in 1841. In the United States the San Francisco police department began to use photographs in 1854. Within two decades police departments in New York, Chicago, and Cleveland had joined it. These collections of photographs became known as “rogues’ galleries.” In most situations these were actual gallery spaces open to the public. It has been argued that these functioned to cultivate a public perception of a criminal type that was manifest in appearance, particularly the face. Their popularity was such that P. T. Barnum added a rogues’ gallery to his New York museum (Gunning, 1995, p. 24; Hall, 2009, pp. 65–69).

Identity Documents

Photography was established as a reliable source of empirical evidence in official identification practices in the second half of the nineteenth century. To reveal the

“true” identity of the subject demanded a frontal pose with no facial expression, a sharp image with no exaggerated effects; the initial slow speed of early cameras enabled one short-lived act of resistance – the distortion of facial expressions (Gunning, 1995, pp. 25–27). Art historian John Tagg (2009) argues that the use of photographs in identification practices also depended on significant change in representation practices; “it was no longer a sign of power and prestige to be recorded but a sign of subjection and subordination” (p. 54). This iteration of the critique of portraits as a vehicle for democratization draws from Michel Foucault’s (1977) argument about modernity and disciplinarity. Representation practices centered on documents and photographs produced an “individual” that became critical to the governing practices of the modern state.

Foucault’s work has provided the framework for much of the historical analysis of photography and identification documents (Robertson, 2010; Sekula, 1986; Tagg, 1988). The literature on the emergence of identification photographs tends to approach its object in two ways. It addresses the photographic image through the modern project of classification, specifically phrenology and physiognomy. Second, it isolates the record-keeping practices necessary for photographs to be useful to official identification practices.

As with honorific portraits, the various forms of identity photographs drew from phrenology and physiognomy. In photography critic Alan Sekula’s (1986) influential borrowing from Foucault he argues the development of photographic portraits produced a “shadow archive” (p. 15). The knowledge and position assigned to photographic images of the criminal body was a relative one. The recognition of a criminal type as “other” (repressive portrait) was associated with the representation of its opposite, a law-abiding bourgeois subject (honorific portrait). In both instances photography was understood to illustrate character “types”; “the ‘natural’ order of social structure and stratification was thought to be readily available in the evidence of the human body” (Green, 1984, p. 6).

The use of photography to illustrate racial, social, and class types reached its extreme in Francis Galton’s “composite” photographs. Rather than identify a specific individual, in these images he sought to extract the typical physiognomic features of a given group from multiple photographs of individuals. For Galton these composite photographs, carrying with them the “truth” of photographic realism, were important as he attempted to give credibility to his theory of eugenics (Green, 1984; Sekula, 1986, pp. 40–55).

Photography was considered useful to identification because of its indexicality and iconic accuracy. This understanding made photography an ideal way to articulate a unique identity to a specific body, but as cultural historian Tom Gunning (1995) notes, “the photograph remains too individual, too specific, to be processed as thoroughly as rapid modes of information circulation demanded” (p. 31). Or as Sekula (1986, p. 16) argues, debates about “optical realism” detract from the critical object in the emergence of “instrumental photography” – the filing cabinet not the camera. The key example in these arguments is the system Alphonse Bertillon created to

police recidivism in France in the late nineteenth century. Bertillon created a card-system that produced an identity created to facilitate the retrieval of files. Multiple measurements were taken from a prisoner's body. These were recorded on cards with a photograph attached. The cards were divided into successive subdivisions based on the collected measurements, each division organized into predetermined categories of below-average, average, and above-average. If done correctly this could break a collection of 100,000 cards into groups of no more than a dozen (Sekula, 1986).

Anna Pegler-Gordon's (2009) innovative research on the late-nineteenth-century use of identity photographs in the policing of Chinese immigration provides an important example of the contested emergence of identification photographs. She argues that the photographs on certificates issued to Chinese blurred the distinction between honorific and repressive portraits, which led to officials questioning their confidence in the objectivity of the camera.

In 1893 the US Congress approved the introduction of photographic identification documents for Chinese seeking exemption from the Chinese Exclusion Act. The novelty of the Chinese photographic documents in the 1890s speaks to a general acceptance of written descriptions of physical appearance in official identification; photographs did not appear on passports until World War 1 (Robertson, 2010, pp. 80–91).

The regulations introducing these documents made manifest the faith in the accuracy of the camera. The initial regulations regarding photographs were brief, indicating a trust in the essential accuracy and reliability of a photograph as evidence of identity. The Immigration Bureau required that photographs not be retouched or mounted and that they provide an accurate representation of the face.

The majority of photographs provided were simple frontal portraits focused on an individual's face. However, not all were. These exceptions challenged the blind faith in photography. Chinese used studio photographers and made use of many of the poses and props that photography had borrowed from the portrait tradition. Subjects stood, sat, faced the camera, or looked to the side. While most wore Chinese clothes, some men presented themselves with the markers of Western masculine respectability: suits, ties, and even facial hair. Others adopted a very traditional Chinese cultural appearance. The majority of these images were rectangular vertical portraits, but some had trimmed corners and others were in the shape of arches or ovals. The position of Chinese relative to the categories of exclusion tended to determine the style, content, and form of photographs. Native-born US citizens made use of Western conventions in an attempt to emphasize their Americanness. Women filled their identity photographs with evidence of their class status and home life to try to avoid being identified as prostitutes (Pegler-Gordon, 2009, pp. 42–61).

Beyond playing with photographic conventions, Chinese also deliberately manipulated actual photographs (Pegler-Gordon, 2009, pp. 70–76). This strategy further challenged official trust in the automatic reliability of photography. Chinese attempted to break the link between document and person by substituting photographs on documents and exploiting the "vulnerabilities in the image" (Pegler-Gordon, 2009,

p. 71). In the latter case, the image was intentionally altered or retouched. Sometimes even this was not necessary due to the poor quality of the photograph. A blurry image could produce sufficient ambiguity to enable someone to use a document issued in the name of another person.

Officials responded to these actions with regulations that collectively amounted to the realization that a photograph of a person did not guarantee accurate identification. New regulations and the actions of officials seemed to acknowledge that the conditions in which photographs and documents were produced had important consequences for the success of a photographic image as a mode of official identification.

In an attempt to curb the substitution of photographs an official stamp was placed over part of the photograph when it was attached to the exemption certificate. A new regulation specified that the three photographs submitted should be identical photographs, produced from the same negative. Applicants had often sent in different images, a practice that prevented officials using the application form to determine whether a photograph on a certificate had been substituted (Pegler-Gordon, 2009, pp. 74–75).

The Immigration Bureau began to photograph Chinese as they arrived in one more effort to more effectively use photographs to secure identity. Standing outside, immigrants held a small chalkboard with their name and other details. Including the name in the actual image was intended to more securely link the image to a name and hence a file. In privileging another identification technology (the name) officials potentially compromised the photograph as a mode of identification. An official photographed arrivals at Angel Island outside in sunlight. These pictures frequently had shadows that distorted the individual's face (Pegler-Gordon, 2009, pp. 62–63).

By 1914 most photographs had a fairly consistent appearance with people facing the camera hatless. Faces were similar sizes and the photographs were cut to a uniform size with consistent exposure and background; regional variations continued until the mid-1920s. In practice standardization meant the reduction of acceptable images and, therefore, an active attempt to prevent subjects from having any control over their self-presentation. Collectively they constituted these photographs as reliable by solidifying the links between observation, description, representation, and record, and hence “truth” and “knowledge” (Tagg, 1988, p. 78).

Legal Evidence

The status of photographs as evidence also emerged in a contested fashion in US legal culture during the second half of the nineteenth century. As with identity photographs, the initial debates sought to establish the nature of the distinction between the evidence a photograph could provide and written and spoken evidence. However,

this quickly became clouded by differences between photographs and other images that could potentially be used as evidence.

Until the mid-nineteenth century, legal evidence usually consisted of words, both spoken and written. The few images sanctioned in a courtroom tended to be either maps and surveys in land disputes or drawings and diagrams in patent cases. As a result of this limited use, visual representation was not a well-developed category of evidence. Legal historian Jennifer Mnookin (1998) argues the attempts to provide a legal doctrine to allow photographs enhanced and challenged the idea that images constituted a category of evidence distinct from words.

Photographs began to be used in US courtrooms in the second half of the nineteenth century. Daguerreotypes appear not to have been used. Paper photographs were admitted in courtrooms but usually only in two types of cases: disputed handwriting cases or to “describe” terrain or buildings in land dispute cases (Mnookin, 1998, pp. 10–11). It was only during the 1870s that photographs occasionally began to be used to verify personal identity.

The contested attempt to bring photographs into the courtroom led to the establishment of a legal doctrine that sought to explain the function of images more broadly. According to the doctrine that formalized their arrival, photographs, like all images, were thought to be identical to witness testimony in verbal form. However, Mnookin (1998) contends that this doctrine was “a formal rule that coexisted with a reality that contradicted it” (p. 50). As a “legal fiction” the photograph in the courtroom made visible two contested understandings that ushered photography into nineteenth-century culture: photographs as unmediated replication and photographs as artifice.

Adhering to the idea that they were constructed objects, photographs were formally admitted to the courtroom as illustrations identical in function to diagrams and maps. A photograph was considered to be a product of technical limitations and skill, be it the focal length of lenses or the complexities of lighting. This judicial critique of photographic realism in terms of human agency meant a photograph was thought of as another form of human testimony and, therefore, something that may or may not be true. At the level of doctrine it was accepted that a photograph could not prove something independent from the words of an individual. The credibility of a photograph depended on the credibility of another witness. As an explanatory aid a photograph needed a witness who could attest that it was a correct representation. A majority of judges, therefore, understood a photograph as something constructed to give visual support to someone’s point of view.

In the 1880s the regular use of staged photographs provided an example of the doctrine of illustrative evidence in practice. These photographs often posed people where parties claimed to have been to recreate scenes of accidents or crimes; in other examples witnesses made marks on photographs to signify their position at the scene. However, the reluctance of some judges to admit posed recreations speaks to an understanding of photography that saw it as distinct from maps and diagrams. For these judges the indexical authority of the photograph created the possibility that as

evidence it could do more than merely illustrate. Viewed through the popular assumption that photography could replicate reality in an objective manner, some in the courtroom recognized that a photograph could persuade a jury independent of the words of witnesses. The unmediated depiction attributed to photographs had the potential to create images that could be seen as a form of proof independent from a witness and, therefore, not open to cross-examination. At its extreme a belief in photographic realism “threatened to make the fact-finding portion of a trial redundant by providing facts in an uncontestable form” (Mnookin, 1998, p. 6); for some judges the attempt to link photographs to the doctrine of illustrative evidence was constructed in full recognition of this difference between photographs and other visual representations.

The belief that photography was produced by nature and science supported the confidence of those who believed that photography had the authority to be an independent witness. Therefore, contrary to the intention of illustrative evidence, in 1882 a Georgia Supreme Court judge wrote, “We cannot conceive of a more impartial and truthful witness than the sun, as its light stamps and seals the similitude of the wound on the photograph put before the jury; it would be more accurate than the memory of witnesses, as the object of all evidence is to show the truth, why should not this dumb witness show it?” (Mnookin, 1998, p. 18). This perspective turned a photograph into a replication not a representation, and into an independent trustworthy witness. In contrast to the narrow understanding of photographic meaning created through its identification with maps and diagrams, in practice photographs could in fact persuade a judge and jury.

By the beginning of the twentieth century the attempt to tame photographs through identification with preexisting visual images had failed. Although photography had been formally admitted into courtrooms with the understanding photographs were artifice, once admitted they were frequently understood as unmediated replications. The prevalence of the latter resulted in the increased use of visual representations beyond the photograph. The indexical quality associated with photography created a larger space for visual images. Mnookin (1998) argues the attempt to give photography a legal history in fact dramatically expanded the category of illustrative evidence, if not actually invented it. As photographs pushed visual representations closer to being evidence not mere illustration, other representational forms came to be understood in these terms.

Print Media

An even more direct engagement between the developing authority of photographs and the existing authority of words occurred in the world of journalism. As with portraits and courtroom evidence, negotiation over the status of photography occurred within preexisting visual practices. The emergence of photographs

in newspapers is attributed to the technological advance of the halftone, which enabled newspapers to publish photographs with relative ease. Photographs began to appear occasionally in newspapers after 1880. However, it was not until 1897 that the *New York Tribune* became the first newspaper to print photographs daily, making use of halftone reproduction that emerged in the 1880s. By this time a new genre of advertising-driven periodicals targeting the middle class had arrived that made extensive use of halftones. However, rather than a triumph of technology, the emergence of photographs in print media can be seen as contemporaneous with changes in the form and meaning of news.

Despite the cultural impact of the daguerreotype and paper photography, in the mid-nineteenth century there was little sense that photography would become an important part of news (Barnhurst & Nerone, 2001, p. 112). Technologies such as woodcuts and wood engraving, various forms of metal engravings, and lithography provided the images considered necessary to print media prior to the emergence of the halftone. The illustrations that appeared in weeklies and newspapers adhered to a distinct visual regime. Historian Joshua Brown situates the images in the illustrated press within the social context of the Gilded Age. He contends that the illustrations helped people master the radical social, political, and economic changes of the period. Brown (2002) argues, “rendering figures whose features and physiques were imbued with the rules of physiognomy, the illustrations in the pictorial press constructed an orderly, detectable, moral map for what seemed so hidden and chaotic in mid-nineteenth century America” (p. 80).

In terms of the specific practices of narrative-driven print media, pre-halftone illustrations were created within a set of practices that “underscored the author, dedicated itself to storytelling and observation, [and] promised vicarious experience to its readers” (Barnhurst & Nerone, 2001, p. 18). In this sense illustration did not transcend the world of words. Prior to photographs illustrations existed in a definition of news that privileged narrative; they functioned to capture the “decisive moment” (Craig, 1999, p. 48) that required emphasis within the particular account.

To successfully contribute to the narrative it was common for illustrators to recreate crucial events in a composite image. *Leslie’s* illustration of President Garfield’s assassination covered what would have been at least a minute of events. The image included the look of surprise on Garfield’s face as well as the apprehension of the assailant. In contrast, two decades later *Leslie’s* coverage of President McKinley’s assassination included dozens of photographs of McKinley and other figures but there was no illustration of the shooting itself (Barnhurst & Nerone, 2001, p. 126).

The halftone came into use between these two presidential assassinations but the difference between illustrations and photographs represented a change in attitude to news reporting and news images. Media historians Kevin Barnhurst and John Nerone (2001) argue photographs became the primary form of illustration only after the art of storytelling was downplayed in news in favor of a commitment to a more “modern” form of realism and objectivity. The “realist ethos” associated with photography did not fit into the authenticity sought through newspaper illustrations. The art of

storytelling in illustrated news depended on a belief in authenticity that privileged the authority of the author and the artist. In this context press photography could only make sense if the “real” was separated from the idea of art and the significance of authorship was downplayed.

In journalism the realist ethos was articulated as objectivity. For Dan Schiller (1981), the integration of photography into journalism was related to the rise of positivism. Photography understood by means of science provided a way in which people came to grasp the idea of an objective world. Although newspapers rarely used daguerreotypes, the cultural understanding of early photography provided newspapers with a metaphorical comparison through which to articulate the idea of objectivity in news (Schiller, 1981, pp. 88–89). Photography bolstered the increasingly dominant cultural belief that truth and accuracy required the absence of human intervention, or rather that the accurate representation of truth required that the role of human mediation be obscured. While there is a debate over the timing and nature of the appearance of “objectivity” in news, one agreed-upon consequence of its emergence is that photographs came to be defined as “factual” in contrast to the “bias” of illustration.

In the larger cultural realignment of the real with the technical, photography and reporting both came to be understood through the erasure of authorship. Photographers came to be seen as witnesses, not responsible for their images in the way a sketch artist who gathered images from people at the scene had been. The photographs they took acquired “news values” such as immediacy, conflict, and prominence. Further, in the modern newspaper formation many of the tasks previously assigned to words – dramaturgy, depictions of demeanor, and the description of visual detail – became the task of photographs (Barnhurst & Nerone, 2001).

Brown (2002) argues that the understanding of photo-realist conventions as objective did not alter preexisting representational strategies, and therefore they did not challenge understandings of national identity and ideals of citizenship. A portrait tradition continued and with it the use of racial and ethnic typing in images; in fact photographs in print media enhanced the authority of these images as accurate representations. The objectivity of photo-realist methods was articulated to the objectivity of scientific theories about racial and class hierarchies; in the social and cultural context at the beginning of the twentieth century the “halftone effect” (Harris, 1990, pp. 304–317) did not mark a distinct “epistemological or representational break from earlier practices” (Brown, 2002, pp. 241–242).

However, Barnhurst and Nerone (2001) argue the emergence of photographic realism did alter other aspects of citizenship. In the world of print journalism the arrival of photographic realism saw the emergence of a greater passivity on the part of readers as citizens. The use of illustrations in a narrative mode had brought the viewer or reader into the world and implied a republican model of citizenship. In exchanging temporal narrative for immediacy and emotional impact, realist press photography offered a new model of citizenship. This was citizenship that in the name of a realism derived from objectivity divided the reader or viewer from the

world. This is evident in the “photojournalist.” Understood as a witness, he or she made manifest that “journalistic realism projects an audience that can neither blame journalists nor take effective action in the public sphere” (Barnhurst & Nerone, 2001, p. 138). Photographic images were published with a commitment to “realism” and a commercially driven populism, but not with any sense of civic responsibility.

This new relationship between reader and print media is even more evident in the phenomenally successful “ten cent magazines” that emerged following the advent of the halftone. These instantiated a distinct break in the relationship between readers and the publications they purchased; advertisers, not subscribers, funded the magazines such as *Munsey’s*, *McClure’s*, and *Ladies’ Home Journal*.

The perception that photographs were more realistic than illustrations attracted advertisers. However, this was a “realism” in which the importance of artistic enhancement was recognized. Explaining the use of a staged photograph in an advertisement, one of the pioneers in commercial art theory wrote, “it is a real picture but drawn with a camera” (Phillips, 1996, p. 148). Realism in the context of advertising was the “art of making dull reality interesting” (Phillips, 1996, p. 140).

Photography was once again dragged into debates about the democratization of culture and more directly the rise of national commercial culture. The linking of art and industry through the medium of the halftone was a frequent subject for discussion in photographic and advertising industry trade journals at the turn of the century. For proponents, photographic images in advertising offered the potential to expose more of the population to high culture. For critics, this form of advertising cheapened people’s aesthetic sensibilities. It was argued this would likely lead to a rise of superficiality and mediocrity (Phillips, 1996, p. 152).

Conclusion

In the field of media studies, photography is often positioned to provide a critique of historically specific modes of understanding and representation. The photographic image is not ignored, but it is rarely viewed in terms of the actions of an individual or to explain or advance aesthetic debates. John Tagg (2009) argues photography is not something that is simply given, “it has to be constituted and it has to be instituted” (p. 14). For Tagg this makes the analysis of photography a Foucauldian project to examine the unstable and contested discursive conditions in which different “photographies” are constituted. However, for many scholars within media studies, the historical analysis of photography is not a Foucauldian project, but one that identifies social contexts *external* to photography in which photographic technologies were mobilized and instrumentalized.

However, regardless of the approach within media studies, the analysis of the emergence of photography is articulated to “modernity.” The analysis of photography grants important specificity to modernity; it becomes a historically specific

object of study not a largely bibliographic frame of reference used to advance theoretical arguments (Morris, 1998, p. 2). This is not to suggest that when linked photography and modernity don't encourage the contemplation of large-scale historical debates. However, the preceding examples are intended to illustrate that be it linked to understandings of personal identity, citizenship, national identity and democracy, or capitalism, consumption, and mass culture, the complicated set of practices associated with photography provide important instances of how the present of the nineteenth century was imagined and interrogated as new.

Within the particular context of media studies it is important to note that nineteenth-century modernity saw "unprecedented transformation in the conditions of human contact, along two axes in particular: transmission and recording" (Peters, 1999, p. 138). Photography has long been positioned as an important way to comprehend this transformation. The preceding examples emphasized this through the tension between the authority of the written word and the photographic image. Implicit in these specific examples is that nineteenth-century photography suggests a new form of inscription ("-graphy"). As Lisa Gitelman (2000) has argued, new inscriptions "regulated modern experience, making life more legible in complicated, public ways" (p. 11). To that end photography illustrates that "inscription is a form of intervention" (p. 3).

In the distinct local spaces of the living room, the courtroom, and the border, photographic images articulated to other visual practices challenged understandings of truth and memory. Here transformations in recording and transmission come to be understood in terms of an unsettled modernity structured through new relations of circulation; whether it be the circulation of identities, evidence, or commodities, and therefore a modern conception of information centered on exchange value. Historian Matt K. Matsuda (1996) writes of the "memory of the modern" where memory is an activity, an act of *coordination* (pp. 6–8). In the example of the state, it remembers, it acts through documents, practices, and institutions that constitute the memory of the state. In a similar vein Gunning uses "circulation" to locate one critical aspect of photography within modernity. Beyond the indexical and iconic he argues the "detachable nature" of a photograph "allows it to refer to an absent object separated from it in space and time" (Gunning, 1995, p. 20).

The intention of this chapter is to push media studies beyond a focus on photography in terms of news or print media to look at other sites in the dispersed and complicated emergence of photography. However, it has admittedly done so without challenging the dominant framework that grants pride of place to analyzing the information that is identified and legitimated through the emergence of a range of photographic practices. Barbie Zelizer's recent book makes the specificity of this approach apparent.

In *About to Die: How News Images Move the Public* (2010) Zelizer uses imagination, emotion, and contingency to frame her analysis of photography, specifically an examination of "about-to-die" images. Her project is not about the negotiation of authority in terms of objectivity. Instead, Zelizer (2010) explores the idea that

“photographs facilitate making sense of the world in a way that is not necessarily rational, evidentiary or reasoned” (p. 13). Her analysis still privileges the relationship between photography and memory, but it is the role of memory and photography in securing “more affective and extrarational engagement” (p. 314). This is something Zelizer argues runs counter to the idea of journalism as an “information relay” in the present. Her book is a challenge to the uncritical acceptance of journalism as a project of modernity and, therefore, the acceptance of journalism as a rational project in which images will always be secondary to words.

In the context of the current chapter what is most provocative about *About to Die* is its ability to say something new about journalism and photography. Zelizer is able to do this because she challenges the way “modernity” has been used to articulate photography and journalism. Even if not conceived as such her project speaks to the broader “affective turn” in recent cultural analysis.

While *About to Die* is largely a critique of contemporary practices it provides another example that photography is not a technology with a single meaning or a single history that plays the same regardless of context. Photography remains a productive site for critical thinking within media studies. This chapter has highlighted some of the social contexts and discursive conditions which an analysis of photography can foreground. However, from the perspective of media history the contested emergence of photography in a period of significant social change makes its early history an important, and still largely unexplored, object for analysis within media studies.

Moving Images

Portable Histories of Film Exhibition

Haidee Wasson

ABSTRACT

This chapter surveys the ways in which the history of film exhibition has been conceptualized and elaborated by film historians, with special attention paid to the possibilities of an expanded current historiographical approach that includes small film technologies, in particular, portable film projectors. Like theatrical exhibition, the portable projector exemplifies the nineteenth-century marriage of mechanical movement, chemistry, and projected light. Yet, the portable projector is a distinct iteration of these technological foundations, leaving behind the theatrical armature of the movie house and emulating more the other small, audiovisual technologies that together reshaped cultural life in the twentieth and twenty-first centuries. Charting a neglected area of film and media history, this chapter considers the dynamics of portability for a history of seeing movies, concluding with some larger research questions posed as directions for future work.

From the perspective of the film historian, cinema's past is far less certain than its future. This familiar if slightly amended aphorism takes on particular meaning in our contemporary context wherein death knells for cinema (or at least celluloid) are common. To be sure, mobile screens, digital cameras, and YouTube indicate the technological conditions for a moving-image culture currently undergoing rapid

change. The formal qualities of moving images are being transformed by tiny displays and low resolution. The surfaces of cinema seem to be multiplying, from one's lap to the exteriors of decayed industrial complexes. Digital technologies have globalized the production of single films, with US blockbusters conceivably shot in China, edited in London, and post-production effects completed in Montreal. But far from presuming cinema's celluloid past to be quaint and unsophisticated by comparison, changes in the contemporary moment are directing and enlivening the questions being brought to bear on film's historical landscape.

Take, for instance, a seemingly simple question: Where and how have people seen movies? The conventional answer has long been movie theaters. Yet, recent scholarship is showing that a range of technologies and venues provide an expanded scenario for the presentation and performance of film. Far beyond the picture palace or main-street's marquee, educational movie vans, county fair film tents, product display screens in department stores, classroom AV carts, and YMCA film nights have all proven themselves to be recognizable aspects of US film culture by mid-century. In other words, the more that is being learned about cinema's past, the more some of our deeply held assumptions about how cinema has long been seen – as a rich image projected in a dark purpose-built large space – are inadequate for a full understanding of the power and place of film in our cultural histories.

This chapter surveys the ways in which the history of film exhibition has been conceptualized and elaborated by film historians, with special attention paid to the possibilities that an expanded historiographical approach – which includes portable film technologies – holds for future scholarship. Recent work on the showing and viewing of movies has included a wider selection of film types, locations, and technologies, multiplying our ideas about where and when cinema happens. This scholarship assumes the significance of the movie theater as an enduring film institution and a dominant iteration of film display. Yet, this work also takes a broad and non-normative view of film performance, expanding the conditions in which cinema became a commonsense element of our past and present media ecologies. This chapter argues that while the movie theater is an enduring and constitutive aspect of seeing movies, there is much to gain from examining the full range of technologies and institutions that have long made use of films. This entails a notable increase of the films deemed significant for inclusion in film history (industrial, educational, governmental, amateur), a broader set of salient sociocultural dynamics beyond art and entertainment toward what some have termed “useful cinema” (citizenship, worker productivity, corporate communications, piety, efficient learning), and a more nuanced and complex understanding of the many technologies that in fact have made spaces and screens into contexts of cinematic display (small gauges, public address systems, portable screens) (Acland, 2009; Acland & Wasson, 2011; Greene, 2005; Griffiths, 2008; Hediger & Vonderau, 2009; Lester, 2008; Orgeron, Orgeron, & Streible, 2011; Smoodin, 2011; Wasson, 2005).¹ Like theatrical exhibition, the portable projector exemplifies the nineteenth-century marriage of mechanical movement, chemistry, and projected light. Yet, the portable projector is a distinct iteration of

these technological foundations, leaving behind the theatrical armature of the movie house and emulating more the other small, audiovisual technologies that together reshaped cultural life in the twentieth and twenty-first centuries. Charting this tendency in film history, this chapter considers the dynamics of portability for a history of seeing movies, concluding with some larger research questions, posed as directions for future work.

While the field of film studies has long been largely focused on understanding the languages of cinema, there is a small but important body of work that has assessed the peculiar institutions of film display that are foundational to cinema's aesthetic, social, and cultural significance. Scholars of film exhibition presume several essential things about cinema and its history. Movies don't just appear, they are presented and made visible by a particular kind of display logic, one often predicated on sizable, seated, and repeat audiences that rent, among other things, a line of sight to the screen. The magic of the movies does indeed rely on magicians. But among the filmmakers, stars, and effects wizards are also a host of architects and designers, theatrical technicians, electrical engineers, ambitious entrepreneurs, masters of publicity, and event-planners who have long conspired to shape the experience of watching movies. Some are earnest programmers of the artistic or obscure, and others spokespeople for centralized global entertainment. Together, and with a host of other players, they create what we might call the backstage drama, the "behind the screen" dynamics of film presentation. These dramas and the situations they yield constitute the primary interface between films and the large and small publics upon which cinema's fortunes have long rested. These interfaces provide the sites wherein our experience of films and other spectators unfolds and the social, embodied dynamics of seeing play out. Scholars of film exhibition assert that cinema does not primarily happen on a celluloid strip, in front of a camera, or in a film can, but on a screen. This screen is where minute chemical and optical inscriptions become legible through projected light and amplified sounds, framed by geometries of display and theatrical architecture alike. Many scholars of film presentation understand that showing movies implicates the institutions of cinema in a range of technologies. Even taking movie theaters among the many moving image platforms, such theaters themselves have never been simply boxes made of celluloid but hybrid venues where a range of technical innovations contribute to the darkness, the comfort, the spectacle, and the other attractions of the theater (amplified sound, conditioned air, cavernous lobbies). Yet, the multi-mediated movie house retains a special place in thinking about cinema's specificity as a modern medium and mode of expression.

The touchstone for work on film exhibition remains Douglas Gomery's (1992) survey text *Shared Pleasures*, which examines the history of movie presentation – largely but not exclusively – focusing on the movie theater, considering both the business of the film show as well as the popular and specialized or niche manifestations of the theatrical enterprise (from populist movie palaces to small ethnic and arthouse cinemas). Subsequent work has been more focused, providing rigorous histories of exhibition in particular locations and in particular types of theaters

(Allen, 1996; Belton, 1992; Fuller-Seely, 2008; Jones, 2003; Singer, 1996; Waller, 1995; Willinsky, 2001). More recently, scholars have examined exhibition in a radically changing technological and industrial context, where theaters are less stand-alone outposts for singular film events and more like monitors networked to global entertainment flows (Acland, 2003). Collectively, such work has yielded excellent assessments of the place of movie theaters in the business of film. This literature has also investigated the industrial and social regulation of cinema, the dynamics of public leisure, and cinema's links to other public modes of entertainment and leisure. Blending social and cultural histories, incorporating considerations of class, race, and gender, this work assures us that there is nothing simple about going to the movies (Grieveson, 2004; Hansen, 1991; Maltby, Stokes, & Allen, 2007; Stamp, 2000). While a good deal of this work has concentrated on movie theaters before the rise of television, there is also important research documenting and theorizing the place of other technologies for transforming the conditions in which films are seen, and the stylistic conventions of films affected. The rise of video and then digital playback devices such as DVD in the 1980s and 1990s, which proved to be paradigmatic for how films were made, marketed, and eventually seen, definitively poses a challenge to the singular dominance of the movie house for thinking about film presentation and film viewing (Klinger, 2006; Wasser, 2001). Building on this work, what follows presumes these interdependencies of film presentation, with a range of visual and audio technologies, to be continuous throughout its history, long before the rise of video but also before and alongside television.

So, what do we know about film exhibition before home video? We know that movie theaters and indeed film exhibition more generally changed considerably during cinema's first 60 or so years. From the first storefront theaters, which emerged around 1905, to the picture palaces of the teens, 1920s, and early 1930s, from single-screen sites of mainstreet congregation to the panoramic screens of Cinerama, the appeal and power of the darkened, audience-filled theater have proved resilient. In the United States, the showing of films grew from peep shows and penny arcades, as well as fairgrounds, itinerant showmen, and traveling lecturers. Early on, films were small parts of other live multi-format entertainments, prominent among them vaudeville (Allen, 1991). In a sense, moving pictures grew as but one element of the rising leisure industries of the nineteenth and early twentieth centuries, finding their own specific business mode a decade or so after their initial appearance.

Nickelodeons or what Gomery (1992) has called "movie-only theaters" (p. 17) emerged in the United States around 1905, and quickly became a prominent part of the amusement economy. Nickelodeons were often converted retail sites, with hand-painted signs indicating the day's fare. But, in truth, nickelodeons were not "movie-only theaters." As Gomery himself and many others have documented since, nickelodeons were lively, variety based sites. They often included a mix of live and recorded performances, a mix of sound devices (recorded, mediated, instrumental, and live) and varied modes of patron address, including sidewalk barkers, painted posters, and automated announcements. The "movie-only" theater was not so much

exclusively dedicated to movies, but organized itself around a business model that had movies at its core, and was fully dependent on a wide range of other media and presentational modes to round-out a theater's offerings, making "the movies" into a distinct kind of mediated, entertainment event. Scholars of early and silent cinema have dutifully reminded us that conventions of viewing films long included the rituals of other popular public entertainments, including audience participation, a mix of recorded and live presentations, and the less seemly politics of segregated seating and regulated behavioral codes (Abel & Altman, 2001; Lastra, 2000). Indeed, movie theaters have long been highly codified and controlled spaces. Religious groups, civic reformers, and a motley assortment of moral crusaders have persistently espoused the dangers of theaters, films, or both.

As these theaters proliferated, they helped to establish a recognizable genre of public entertainment, and the retail face of the US film industry, providing a reliable sales window for film product. Stabilizing the theater as the point-of-sale for movies allowed the industry to establish market share in a growing entertainment industry. Theaters ensured an outlet for their products and provided a predictable and appealing site for repeat visitors. Nickelodeons and the large purpose-built theaters and regional and national chains that followed were key to the US film business transforming into the powerful conglomerates we name with the umbrella term "Hollywood."

The story of the movie theater's growth parallels the consolidation of the film industry more generally. By the mid-teens, filmmakers had established the basic model for its primary and most profitable product: the feature-length, narrative fiction film. Many other film types were made and seen, including a variety of short film genres (sing-along films, animated, newsreel, comic, travel, and novelty films). Yet, the feature-length narrative became the centerpiece for these other products. During this same decade, purpose-built movie theaters appeared, seating 500 and 1,000 patrons rather than the 200 or less of the nickelodeon. The trend toward larger theaters did not eliminate other models for theatrical film presentation, but resituated them as residual within a rapidly expanding industry.

Urban environments hosted a range of differently sized theaters. Smaller towns found ways to adapt extant spaces (opera houses, town halls) to accommodate cinema screens. Yet, the larger and larger theater was clearly understood by the rising industrial power as the most profitable and therefore appealing path. Throughout the 1920s, theaters in general became inextricably linked to a vertically integrating industry. More and more film producers bought up distribution and exhibition venues; more and more theater owners merged or bought up distribution and production interests. By the early 1920s, the film industry resembled a complicated hybrid: nineteenth-century presentation models of live theater and the national retail model established by grocery and department store chains designed to efficiently, reliably, and regularly deliver standardized products (Abel, 1999; Gomery, 1992). Trends toward vertical and horizontal integration became more pronounced as the decade moved on; innovations in sound and amplification technologies led to

corporate partnerships between film industry, cognate entertainment industries such as recorded music, and the large electrical conglomerates (Crafton, 1997).

As the movie theater evolved, its foundational appeal was further augmented partly by reconceiving of it as a high-tech, architecturally grand and glamorous site for an evening out. By the mid-1920s, what were previously small theaters with 10–12 feet screens grew to gargantuan proportions. At their biggest, theaters such as the Roxy and Radio City Music Hall built in the early 1930s, even as the Depression took hold, sat 6,000 people. While their 25–30 feet screens must have been somewhat dwarfed by their cavernous halls and grand proscenium arches, the exotic palaces served as opulent symbols of the global juggernaut cinema had become. The larger-and-larger paying audience – its very size constituting part of the appeal of the movies – became the industry ideal. Service was high yet the populist rhetoric of even the most grand palaces was supported by a common consumerist ethos: luxury that anybody could afford (Melnick, 2005).

Recent scholarship has emphasized the modernity of cinema, examining its formal capacities for compressing and refiguring space and time as well as its corollary capacities for distributing and displaying those images efficiently from one side of the earth to another. As a global system for spreading words and images at rapid speeds and great distances, cinema – at one level – was a formidable modern machine. Yet, the palace was an interesting outpost for these typically modern proclivities. William Leach (1993) notes that like picture palaces, department stores during this period often used deeply historical and exotic tropes in their architecture and displays while simultaneously averring the virtues of the modern through their products and merchandising practices. Leach suggests that the exoticism of the department stores served in a way to soften and sanction the arrival of machines and their systems. Similarly, while palaces often invoked the historical and exotic in their Egyptian, Romanesque, and Greek stylings, they also featured the most up-to-date technologies of sound and image throughout. Air conditioning, theater-wide sound amplification, public address systems, live radio broadcasts, elaborate electrical lighting, and significant ballyhoo all helped to make the movie theater into a kind of modern masthead for the industry's imperial and technologically sophisticated ambitions (Melnick, 2005; Thompson, 2002; Wurtzler, 2007).

Yet the emphasis on the movie theater and the ways in which it was a highly technologized and mediated space, connecting the theater by recorded sound, radio, and sometimes television to all manner of ethereal and actual spaces, fails to remind us that palaces were gargantuan, immobile, and permanent. Cinema was a mass medium in the sense that it enabled an industry that made products for the many. It fostered a distribution system that facilitated the efficient circulation of its goods to retail sites (theaters) and was predicated on a consistent flow of new, largely standardized product. But this product was designed to be rented, first by the theaters who would temporarily show the film, and by viewers who temporarily rented a seat in order to gain a line of sight. Movies were not typical commodities in that they were not owned by theaters or by the great growing mass of consumers. Following this

logic, the theater's screen becomes both the showpiece for cinema's circulatory ambitions, and the endpoint for the same. The movement and circulation of films in a sense stopped at the theater's screen. Yes, things cinematic existed beyond the films themselves and moved more nimbly. Film merchandising, fan magazines, endless talk about films in newspapers, all allowed for a kind of extra-theatrical life to moving images, implicating cinema in dispersed networks of media technologies and institutions. Nonetheless, the theater acted as a kind of bulwark to the possessive impulses and physical intimacies being accorded to cinema that we readily associate with novels, phonographs, and even living-room television sets.

The movie theater remains a rather curious institution, an unlikely outpost for a cultural form heralded as defiantly mobile, malleable, reproducible, and accessible. Plainly, the basic idea of a theater long predates cinema, pulling forward the significance of dedicated or specially demarcated spaces for traditions and practices of live drama, performed music, public oration, and even the circus barker, the side-show magician, or middlebrow occultist. Theaters frame sites of performative possibility, marking off a pedestrian or prosaic sound or gesture from the potentially profound. Theaters generally depend on people performing for other people who gather to watch, listen, and possibly respond to or interact with the show. Building on the appeal of events and temporary gatherings, the permanence of the movie theater has long been further assured by its technological complexity, making it difficult to precisely reproduce its attractions in ad hoc or impromptu fashion. In part, this has long served as a barrier to entry into the business of film.

Yet, isn't it odd that a medium heralded as powerful in part because of its basic reproducibility – its ability to be copied, to multiply and thus refigure previous limits on circulation and performance, a mobile show-in-a-can – could for so long be so constrained by the comparatively immobile, bricks-'n'-mortar, professionalized apparatus of the theater? Books had long before demonstrated the power of cheap reproductions, small formats, and widespread circulation. Music had been turned into small, reproducible, commodity forms in the case of wax cylinders and vinyl phonographs, turning music into a private, automated device. Lithography liberated the original artwork and photography created a world of small, inexpensive, hand-held images widely circulated and seen. But films themselves resisted – for a time anyhow – the impulse of a media form whose content and playback devices were fully accommodated to consumerism and a constant physical intimacy with the consumer.

For film scholars, the movie theater has rarely been seen as an impediment to cinema. Quite to the contrary, the movie theater has long been the privileged and often idealized site for understanding the specificities of cinema, whether conceived as a mass medium, a popular commercial form, or a modernist art (Andrew, 2002; Barthes, 1979). The significance of the movie theater undergirds histories of a growing and powerful industry, changing leisure patterns, and enduring theories of cinema that seek to assess the specific language of film and its relationships to subjectivity, identity, and experience, many of which often presuppose the theatrical

display of film. To be sure, its place is rightfully central in film and media studies, as the movie theater has provided a powerful and dominant stage for the encounter between moving images and those who watch them, between an industry and its paying customers, between artists and their interlocutors. Yet, the theater seems less odd, its dominance less puzzling, when one accepts recent challenges to the idea of its singular hold on the history of film. In other words, it is becoming clearer that the movie theater is but one iteration of film presentation throughout the twentieth century. This insight is being catalyzed in part by bringing film history into dialogue with media history. An archaeology of small film technologies demonstrates that celluloid, projectors, and screens share long and enduring parallels with other consumer media technologies, providing an alternative history to film performance than that suggested by the movie theater and its core ideal of large audiences, controlled performance, and standardized projection.

Non-Theatrical: The Other History of Showing and Seeing Films

This chapter now turns to consider another way of thinking about a history of film performance by examining the dynamics of portable projectors. In contrast to the movie theater, this other history is characterized less by majestic spaces, large audiences, or the special event and more by the technological transformation of everyday spaces and activities, small audiences, and a panoply of consumer gadgets. The history of portable film projectors offers a quick view to another kind of cinema, providing insights into an enduring technological infrastructure for a distinct mode of moving image circulation and display, one that challenges the singularity of the movie theater in our received histories of film. The history of portable projectors includes large but mostly small technologies of cinema. It requires charting and assessing not just the expanded technologies of cinema (projectors, screen, microphones, turntables, amplifiers) but the expanded spaces or sites of cinema. In what remains of this essay, I will focus on several prominent aspects of the discussion about portable film projection technology during the 1920s and 1930s. As the purpose-built movie theater secured its place in the dominant business model of the US film industry throughout the teens, punctuated in many ways by its resolutely oversized iteration in the form of the “picture palace,” another kind of cinema was also emergent. In the shadow of a resolutely big and physically enduring idea of the movie theater, there was a parallel and equally determined movement toward a small, nimble, self-operated cinema of the most portable, temporary type.

In our current media environment saturated with the language of *mobility*, the concept of *portability* sounds both familiar but also rather quaint. In the context of film history, the concept of portability holds particular meaning. It indexes a particular kind of movement, one less tied to invisible networks, unlimited content, and

instantaneous, omnivorous connectivity, and one more linked to the physicality of bodies, things, and places. To be sure, portability was a foundational characteristic from cinema's earliest days, as Charlie Musser and others have shown. Yet, as the film industry developed, itinerant showmen and traveling lecturers gradually decreased in significance as movie theaters rose to the fore of the rationalizing film business. The purpose-built, permanent movie theater quickly became linked to the dominant and anti-competitive behaviors of film production and distribution interests. Part of this control was through film technology itself; through the highly flammable, 35 mm nitrate-based film standard. The high heat of projection bulbs, exacerbated by their enclosure in the metal housings of the projector, ensured that film projection was a risky business. Movie theaters were heavily regulated spaces, requiring formidable safety codes (fire-proof booths, proper ventilation, flame resistant materials) and licensed projector operators. All of these factors forged a regulatory environment influencing who could and could not show movies. The development of a sustained network of self-operated portable projectors took an identifiable turn in 1918, when technology manufacturers began actively lobbying the Society for Motion Picture Engineers (SMPE) – the primary organization for establishing technological standards and directing innovation in the US motion picture industry – to formalize a definition of and therefore expressly give license to the portable projector, one that would be free of the strictures associated with the movie house (Jenkins, 1918).²

At this time, portability in film culture entailed an idea about lightness of weight and sufficient image size. But, for the growing industry, parts of which were invested in securing an expanded circuit for cinema technologies, non-flammability was a primary concern. A non-flammable projection set-up would in theory release projectors and projectionists from some of the heavy regulations imposed on film shows by the insurance industry, municipal fire codes, public safety regulators, and labor unions which collectively shaped the politics of theatrical film culture. The impediments to widespread portability were indeed numerous, but they were easily crystallized in the figure of the simple and brute physicality of the fire-proof projection booth. In 1918 when Alexander Victor, head of the Victor Animatograph Company, implored the SMPE to formalize the conditions in which portability would thrive, he joked: "No user could consistently arrive at the place of entertainment, carrying in one hand a truly portable projector, weighing about 25 pounds; but in the other hand, a fire-proof booth, weighing 550 pounds" (Alexander, 1918). Looking at the history of cinema, then, the concept of portability was irretrievably tethered to flammability, and the desirability of a projection machine that would not cause celluloid to ignite upon use.³

Technicians worked to design cooling systems, improve air ventilation, and reduce bulb heat in projectors to diminish the chances of both igniting and also damaging film. But, those little machines ran hot. And, the smaller they became, the more difficult a cooling system was, as hot air tended to get trapped inside the projector's various compartments. Focus on adapting celluloid to withstand the heat of the

projector was one obvious element of any step toward portability. Standardizing a non-flammable film gauge served to focus the technological innovation of portable projectors as it helped to consolidate the development and creation of a market. While the first official non-flammable gauge was forwarded by Pathe (28 mm – widely used since 1912) the history of portable projection took a notable turn in 1923 when Eastman Kodak introduced a 16 mm system, which soon thereafter became the dominant North American – though not the only – standard, non-flammable, portable gauge.⁴

Concurrent to the standardization of the small 16 mm film, camera, and projector, the ideal of the purpose-built movie theater had taken on grand, fantastical, and even epic proportions. It was only months before Kodak's announcement that Sam Rothafel presented a paper to the SMPE which outlined his vision of the movie theater of the future, transferring the wonders of the screen to the whole of the gargantuan, technologically sophisticated, atmospheric theater – a place, he declared, of saturated color, deep and dynamic feeling, and all-encompassing reflective surfaces where thousands would sit to be both entertained and enlightened (Rothafel, 1922). As picture palaces became the crown jewels of the growing film industry, the calls for a small, adaptable cinema only became more pronounced. Following Rothafel's futuristic, atmospheric theaters, a chorus of other showmen, engineers, and technology manufacturers chimed in on the importance of a simple-to-operate, highly adaptable apparatus, freed from the constraints of the increasingly expensive, professionalized, complicated, and formidable theater.

The emergence of a sustainable “small screen” movement, based on simple operation, takes on its fullest meaning with the majestic palace as backdrop. The “small theater,” the “little theater,” “midget cinema”: each of these terms can be seen throughout industry literature of the period. These terms described specialized theaters with limited seating capacity, as well as motion picture projection beyond the theater proper. Partly this vocabulary was linked to a call for a different kind of motion picture dominance than we usually think of as endemic to this period. In addition to gaining a hold on the world's theatrical film screens, all manner of industry pundit called for motion pictures to take their rightful place, serving an ambitious field of functions then performed by other media: newspapers, magazines, books, photographs, canvas (Smith, 1932). The call for a small cinema, then, was also linked to a kind of resistance to the limits of the entertainment model for celluloid promulgated by Hollywood. So, for instance, the call for portable projectors was also a form of advocacy for small audiences. This includes those invested in cinema as erotica, as art (as erotic art), as news, as personal and familial hobby, as industrial and retail aid, as fair spectacle, and mid-way barker, as well as the small audiences that would constitute the first determined to *study* cinema, which we know emerged only a few years later (Grieveson & Wasson, 2008; Polan, 2007).

What could these little machines do? With the picture palace as backdrop, the portable projector announced a form of cinema that was do-it-yourself and bare-bones by comparison. It fit in a box and could be carried like a brief case, easily

handed off from one person to another. Portable projectors were consistently sold with claims that they were “light in weight” and compatible with people on the move. These small projectors took on names like the “Envoy” or the “Lite-Weight” and “The Escort.” In truth, early 16 mm portable projectors ranged in weight. The first 16 mm Kodascope weighed 20 lbs (Mees, 1923). Bell and Howell’s Filmo weighed 9 lbs (McNabb, 1924). Some projectors were said to be as light as 6 lbs (de Tartas, 1923).⁵ One report indicated that as early as 1926 a French inventor had announced a projector no bigger than a cigarette case which, it was reported, could “project pictures as large and clear as ordinary ones!” (Report of Progress Committee 1926–27, 1927).

In these cases, adding the term “portable” to the term “projector” meant that the theater was not the *de facto* point of articulation or source for moving image display, but rather the individual human body instead. The projector’s capacity to be moved from one location to another, one room to another, was consistently linked in advertising, but also design and engineering discourses, to the scale of the human body and its capacity to bear weight, to move, and to master things. The projector was a machine that could be carried with you, in a suitcase, by a handle; it could be operated by leaning over or into it, staring closely at it to thread the film or turn a focus knob. Or, you could – or so the advertising promised – simply stand nearby as it worked its automatic magic.

This ideal of human mastery of the little motion picture machine served multiple functions, including an industrial, business, and sales force constantly in search of new efficiencies and modes of persuasion. For instance, in the late 1920s, Kodak marketed the Business Kodascope, designed to be carried by the hand of a traveling salesman. The Business Kodascope turned any desk or small table into a site of moving image display. Many projectors marketed during the 1930s and 1940s were designed so that the projector and carrying case were indistinguishable, designed not just to look good in operation but also when not in operation. Some cases were designed in streamlined metal, accentuating efficiency. Others were leather bound to look good sitting on a living-room sidetable or a book shelf. Cases also served additional functional purposes. Some could be removed and turned upside down, transformed into projector stands; others served the effort to mask the mechanical sounds these projectors persistently emitted. Lastly, signaling not only portability but also adaptability, many cases coordinated to match other compatible components such as encased amplifiers, turntables and even film cans.⁶

Portability did lead naturally to the need for adaptability. What good would a portable projector be if the places you were carrying it to could not be turned into adequate sites for projector performance? Multiple lenses and different bulb wattages allowed for use in bigger or smaller rooms, and also allowed for some degree of flexibility in projector placement, closer and further away from the screen, deeper into the audience or further away from it. Stronger or weaker light throw designed for differently sized rooms and audiences also entailed a surprising range of screen sizes, in part building on screen practices linked to earlier optical devices. Screens could be placed on table tops and free-standing tripods or mounted on walls, and

hung from ceilings. They could be more permanent and concealed by tapestries or they could be collapsible, rolled up and stored away discretely in a closet. Some screens could be retracted and housed by furniture. These portable screens ranged in size from less than 12 inches to as large as 12 feet. One Chicago-based company called Da-Lite Screen Company, still in operation, marketed 15 distinct and separate models in the “portable screen family.” They claimed 50 standard sizes as early as 1934 (*Educational Screen*, 1934, p. 89).⁷ Screens were selected according to the room they were to occupy, the power of the projector used, the shape of the seating area likely occupied by the audience, and sometimes by storage requirements. In other words, screen size was determined by the needs of the whole display system, scaled for context and contour.⁸

Wurtzler (2007) shows us that the basic technological innovations of electro-mechanical inscription and amplification were the same across the film, radio, and recorded music industries during the 1920s, linking these industries and forms to a common technical base. The result for cinema, as is well documented, is a rather complex shift from so-called silent to so-called sound cinema. And, by the early 1930s, the majority of movie theaters had converted to recorded film sound and amplification systems suited to large spaces (Crafton, 1997). The close connections among the technologies of cinema and other media of this period are further illustrated by our look at 16 mm projectors. The transition of the portable projector to sound happened concurrently with the better-known theatrical transition. Like the theatrical shift, several systems operated in parallel, including sound-on-disk and sound-on-film systems. Eventually, the sound-on-film system predominated. But, there is another story to tell here that complicates the simple idea of a synchronized sound dynamic, as is often told of film’s technological past.

Aspects of the small projector’s relationship to sound can be productively understood by resort to the machine’s basic incorporation of principles of adaptability. A simple example illustrates this. In 1939, the Victor Animatograph Company announced a new projector called the Victor 40, also known as the “Add-a-Unit.” The machine was designed with modularity at its core; a prospective buyer could build the whole system he or she required piece by piece. By the late 1930s, projectors increasingly came with a series of plugs, dials, and buttons so that a user could select desired accessories, in part to accommodate variations in use. The Victor 40 literalized this multi-use concept. The Victor 40 was sold with a choice of compatible devices such as a range of lenses, but also a series of sound playback and amplification devices: a record player, a radio, a microphone, a sound recording unit, multiple speakers, and an auxiliary amplifying unit. When it comes to the portable projector, sound was a dynamic option. It could be live and amplified in the sense of a simultaneous voice-over. It could be pre-recorded and then played alongside a projected image. It could be recorded for another purpose but repurposed as part of a multimedia film show. It could be recorded as the film played, and then used again at a later date. With the Add-a-Unit the possibilities are numerous and extend far beyond the idea of cinema as a simple playback device for prearranged images and synchronized sound.

The addition of sound components is worth some consideration in the context of the small projector. The Add-a-Unit invited users to create their own soundtrack. It invited them to turn up the sound or to make the image bigger, or conversely to make the image smaller and quieter. From a design perspective, these add-on sound units alleviated some of the challenges of synchronized sound. With all of the possible component parts (microphones, phonographs), mechanical and amplified sound reproduction could operate independently of film speed, bulb brightness, and screen reflectivity, lending a high degree of performativity to what we think of as film projection. Moreover, the user could control the speed of the image, to the point of stopping it, exercising a significant amount of control over all vectors of viewing – size, speed, and volume.

Furthering the idea of adaptability to different performance needs, the Add-a-Unit projector, like numerous prewar units, had the ability to play at different speeds and to be stilled, or stopped, in order to project a single film frame in suspended form. Clearly, the Victor 40 and projectors like it enable a distinct kind of film show, one that at the most simple technical level embraces a relationship to other portable devices, themselves with their own life as distinct and separate commodities, themselves undergoing significant innovation, particularly when it comes to lightweight and portable sound amplification. Lastly, it is worth underscoring a simple poetic fact of the Add-a-Unit. The film projector was sold as a unit that was incomplete unto itself. In other words, automatic, simple operation of a celluloid projection machine was seen as only one small part of an immanent ideal of modular entertainment, illustration, performance, and presentational devices.

So, what larger lessons can be drawn for future scholarship from this brief discussion of the small film projector? First, an obvious question: How significant was the portable or small projector? Was it truly paradigmatic, indicative of a wholly different kind of cinema? Or, was it simply a technological oddity, a stutter toward what we now understand as the age of self-operation, digital fluidity, and consumer control? How can we understand its significance in relation to theatrical and other large-screen display formats for the development of film language, business, and art? Some of these questions can't be answered by resort to numbers. But, here are a few.

We know that the number of movie theaters in the United States gradually increased throughout the 1920s, decreased during the Depression of the 1930s, increased to a peak in 1945, and then rapidly reduced by almost 50% in the 20 years that followed. They numbered 19,096 in 1945 and fell to the lows of the 1960s (9,150 in 1963). So, we have received wisdom that at mid-century cinema declines as a public form and television ascends. And ascend it did. Yet, so too did this other kind of small cinema. Sales of small-gauge portable equipment roughly tripled during the decade of the 1950s (Wolfman, 1960).⁹ To take just one year (1959), the SMPE estimated a total of 4,195,000 portable projectors in use and 11,335 movie theaters in operation. This equates to a per capita projector ratio of 1 : 42. Compare this to the per capita theater ratio of 1 : 15,703. In raw, crude figures, portable projectors outnumbered movie theaters by a factor of 370.

There are many ways in which we could complicate these figures. I have not included drive-ins. Movie theaters were in regular, predictable operation with multiple screenings daily. Portable projectors were likely not. Some viewing contexts would use two small projectors to allow continuous projection onto a single screen, thus indicating that two or more projectors might actually only constitute a single viewing venue. But, the basic and indisputable fact remains: small cinema built on the technological infrastructure of the portable projector must be seen as resolutely ascendant throughout mid-century, complementary to a range of other consumer technologies, and a basic element of an everyday media culture, a culture in which film technologies had a recognizable, commonsense role. The small projector proliferates *along with* television and *despite* the decline of its cognate theatrical forms. The common presence of the projector also gives us a clearer picture of the everyday context in which we might think more fully about the emergence of activist, alternative, and experimental viewing which required a qualitatively different viewing network to thrive. We might also think differently about the pre-text for paracinema and avant gardist expanded cinema in the 1960s,¹⁰ as well as earlier collecting cultures, cinephilia, and the growth of film as a mode of university-level study. Certainly, it is the portable projector which speeds along the institutional uses of cinema in libraries, schools, YMCAs, and in business, providing the technical means for a very particular use of moving pictures, or what has been called the technical grounds for making cinema “useful” to a variety of cultural, industrial, and civic authorities.

In the late 1920s and early 1930s, portable and miniaturized cinema was a sizable rebuke to industry largesse and professed permanence. Rather than build spaces around an atmospheric and transcendental idea of cinema, engineers and technology manufacturers advocated for a projector that adapted to extant, usually nondescript, even banal spaces: homes, offices, classrooms (rather than manufacturing spaces that adapted to it). Different from today’s trend toward miniaturization and personalization of portable moving technologies, the projector and its cognate devices were geared toward the small audience, to be distinguished on the one hand from the audience of one and from the mass audience so crucial to how we think of radio, film, and television audiences more generally.

In the context of film culture even before World War II, one can see that portability was a highly spatialized concept. On the one hand it was defined by a negative space: portability meant *not* in movie theaters. But, it was also spatial in the sense that the portable projector and screen were two parts of a technology that were especially sensitive to the size, shape, and illumination of a given space. As Anne Friedberg reminds us in her book *The Virtual Window* (2006), screens are resolutely architectural, transforming our sense of space and our experience of the built environment, harnessing a dialectic of light to enact a particular drama of attention and movement. Extending this basic insight to the portable projector, we can begin to see a whole range of possibilities for thinking about portability and everyday spaces, well beyond movie theaters. We can also begin to break apart the seeming uniformity of cinema. Long before the VCR and the digital, cinema technologies espoused the ability to

arrest motion, to reform spaces, and to either appropriate or utterly disregard the powers of professionalized, industrialized, standardized film performance, challenging steadfast ideas about the coherence of the cinematic apparatus, and augmenting our ideas about technological portability.

The question of how one writes the history of film's public life, its sites of presentation and interfaces with audiences, viewers, customers, and citizens, will continue to benefit from scholars seeking to understand film as part of a family of technologies with deep mutually constitutive relations with other media forms. Breaking apart the long-assumed coherence of "cinema" allows us as scholars to more critically engage with the ways in which cinema itself has long depended on a very partial rendering as magical, seductive, and pure – and heroically resistant to change. But, it also allows us to better understand the many ways that film historians are best served by considering media history, as cognate, parallel, or comparative grist for the historiographic mill. Working with ideas basic to media history (transformations to public and private life, consumerism, and commodity culture; the cultures of automation and gadgetry; contests over cultural authority and control over cultural forms), one can see the way that the sites of film performance have a complex and varied relationship to these dynamics, relationships that we must continue to explore. A history of portable film projectors also writes cinema into media history, a place it rightly occupies.

NOTES

- 1 For touchstones on non-theatrical films, see Streible, Roepke, & Mebold, (2007).
- 2 The SMPE was founded in 1916 with its explicit aim to provide "unselfish service to the Industry." Any person engaged in designing, developing, or manufacturing materials, mechanisms, or processes used in the motion picture or allied arts could become a member and was eligible for invitation. For more on the founding, see Jenkins (1918). Jenkins announced that the setting of standards for the industry was of primary importance, in part to ensure not just a national but an international hold on motion picture technology.
- 3 The Bureau of Fire Prevention of the City of New York (1915) issued a pamphlet stipulating the safety requirements for "Private or Non-Professional Exhibitions of Motion Pictures." These regulations applied to shows that did or did not charge admission, that were educational, religious in nature, and that were held in private homes or clubs. These regulations did not apply to projectors using "slow-burning" film or to "a size or perforations differing from the standard as used in theatrical machines." These guidelines effectively understood "portable" as any showing beyond a movie theater of 35 mm nitrate film, requiring either a permanent fire-proof booth or a portable fire-proof booth. The portable fire-proof booth had to be at least 6 feet high and the floor area at least 20 square feet, say 4 × 5 ft. The guidelines were detailed and elaborate, and entailed clear requirements pertaining to the material used to frame the booth, to cover it (completely in metal or asbestos!), to affix all coverings, and minimal openings for the projector's light and the projectionist's air supply.

- 4 Coincident with the introduction of 16 mm, Pathe introduced an even smaller non-flammable gauge (9.5 mm).
- 5 De Tartas (1923, p. 244) announced a 6 lb camera and projector unit, which also had full capability for still projection without fear of overheating.
- 6 One of these was a new beaded screen fabric “in beautiful leatherette covered, fine wood case with nickel trimmings and solid leather carrying handle” (1934 advertisement, *Educational Screen*, 14, 80).
- 7 See also “a time-saving screen!” Screens promised “amazing sharpness, depth and brilliance to movies and still. Light in weight, the Challenger may be carried easily from room to room.” The Challenger line comes in six sizes, from 30 × 40 inches up to 70 × 94 inches. It is one of a complete line of Da-Lite portable screens (1935 Da-Lite advertisement, *Educational Screen*, 14, 243).
- 8 I have shown elsewhere the significance of the home for early iterations of the 16 mm projector (Wasson, 2009). This idea of 16 mm’s early domestic articulations is also linked to the then relatively recent success of 28 mm. Both Kodak and Victor Animatograph initially described 16 mm as precisely a solution to the demand for home use. See, for instance, Victor (1923). At this same meeting wherein 16 mm is introduced, Willard B. Cook of Pathe also delivered a paper on the 28 mm Pathescope projector. There was no real sense at this moment that 16 mm would overtake or replace 28 mm. See Cook (1923).
- 9 All numbers are from the US Department of Commerce, reprinted in Wolfman (1960). In 1958 the Department of Commerce calculated that the value of 8 mm and 16 mm equipment shipped in the United States totaled \$132,116,000, whereas 35 mm equipment was pegged at \$15,164,000, a differential of 8.
- 10 For a poetic and impassioned discussion of these expanded practices, see Eros (2005).

Sound Histories

Communication, Technology, Media, and Fidelity

Eric W. Rothenbuhler

ABSTRACT

The interdisciplinary study of sound and sound technologies received a burst of new attention in the 1990s, much of it historical inquiry. Given the ubiquity of sound in human experience and the centrality of audio to modern media, this promised an intriguing horizontal slice across fields and disciplines of study. The literature has evolved, though, toward a set of relatively distinct areas of study, including film sound, recording and music history, radio history, and telephone studies. Among these, studies of the social shaping of sound technologies into communication media, institutional practices, and industries continue in the interdisciplinary vein. This issue of social shaping is crucial for communication scholars and media historians in particular, who need an analytic vocabulary for distinguishing and examining the relations among the potentials of technologies and their actual uses and outcomes as media of communication. The issue of fidelity is central to professional and public discourses of audio, and has become a point of critique for scholars. Understood as the accuracy or truth of a reproduction compared to its original, fidelity would appear to be impossible in the current practices of sound media industries. It is proposed here that its enduring utility can be explained by seeing reproduction as a problem of communication rather than engineering or logic.

The study of sound and sound technologies received a burst of new attention in the 1990s from scholars otherwise primarily associated with art, history, literature, media, music, or technology studies (e.g., Altman, 1992; Chanan, 1995; Kahn & Whitehead, 1992; Keightley, 1996; Kenney, 1999; Millard, 1995; Morris, 1997; O'Connell, 1992; Rothenbuhler & Peters, 1997; Siefert, 1994, 1995; Thompson, 1995; Weiss, 1995, 1996). Practicing professionals (e.g., Ondaatje, 2004) and trade book authors also made notable contributions (e.g., Eisenberg, 1987; Lanza, 1994; Schafer, 1994), as items from the engineering literature reached a broader readership as well (e.g., Pohlmann, 2005; Strawn, 1985; White, 1991). "Sound studies" has continued as a strikingly interdisciplinary and heterogeneous topic area, within which each scholar tends to forge his or her own approach.

A history of sound and sound technology is necessarily constructed of disparate elements, and not only because it is not a standard genre of professional history. All histories of media are divergent, as Schudson (1991) pointed out, because the same medium is used in different contexts in divergent ways with divergent outcomes. Beyond that, sound history is organized by reference to a modality of human experience, rather than a medium of communication, cultural form, or institution. So while radio history, film history, and television history are recognized categories of scholarly work, sound history could include attention to all three and to music and the telephone as well. Indeed, a history of sound might consider modes of communication, media of communication, cultural forms, and institutions ranging from public speech to sexual intimacy, the telephone to the radio, ham radio to network radio dramas to formatted music radio to satellite radio, film sound to Internet sound, the recorded music industry, the performance music industry, and the music education industry. The subtopic of audio recording and playback alone might include everything from the phonograph to the digital studio, the 78 to the mp3, the luxury goods of high fidelity to the ring tone, and popular music to audio books to business dictation. Even confining ourselves to one national culture, attention would be drawn everywhere and it might take a book-length treatment just to give brief mention of every possibility.

So sound history is necessarily a selective and heterogeneous collection, defined by arbitrary boundaries and populated by arguable choices; yet scholars must make some reasoned way through it. This discussion will focus on conceptual orientations and methods for making those choices. Discussion starts with the need to define a field of concern and prioritize within it. This is a problem for any student of sound, though here the emphasis is the study of sound technologies as media of communication and culture. The second issue is to establish points of reference for analyzing the social construction of technology, and here there are special problems and solutions for the student of media. The third issue is a potential topic of interest whenever sound technologies are discussed, but becomes especially important and vexing for students of communication. That issue is fidelity.

Fields of Concern

Anyone approaching the study of sound and sound technologies must make choices of orientation, emphasis, and boundaries of concern in two dimensions. In addition

to the usual problems of periodization in historical work are choices of topic and focus within the breadth and heterogeneity of uses, roles, and forms of sound and sound media in communication and culture. These two dimensions are not independent, of course, and we will show how they interact in examples below.

Sound studies, as a topical specialization of its own, invites a kind of horizontal slice across what are otherwise seen as disparate fields of study, creating a new field of concern that is both broader and more specialized than those other fields from which it draws. Some influential edited books from the 1990s, for example, included essays on such otherwise heterogeneous topics as network radio dramas, the microphone, experimental radio, the telephone, music, the phonograph, television sound, and more (e.g., Altman, 1992; Kahn & Whitehead, 1992; Morris, 1997; Weiss, 1996). This approach has not been sustained, though, because no individual scholar can maintain expertise in such a range of phenomena. Individual projects must have a topical point of emphasis within that territory; individual scholars, too, will develop their specializations. The wide interdisciplinary promise of sound studies, then, has tended to result in several different versions of sound studies as a specialty within its various home disciplines. Rather than scholars who study sound in all media, we have film scholars who specialize on sound, music scholars who specialize on sound, those who study the telephone but pay little attention to other media, and so on. The partial exception is a handful of scholars who organize their work by reference to the technologies of sound, whose work then crosses media as related technologies are applied in different fields.

One common choice is to emphasize recording and music, giving little or no attention to radio, sound in film or television, the telephone, or other media. For example, Chanan (1995), Day (2000), Katz (2004), Millard (1995), and Morton (2004) examine the history of recording technologies as an influence on musical history. Within that emphasis there is also room, of course, to examine the influence of recording and playback technologies on the development of audiences, industries, markets, and in turn, their influences back on musical culture and on larger social and cultural trends, as Millard (1995) and others show. Kenney (1999) puts his emphasis there, focusing on recording and its roles in American life, more than its influence on music as such. This is a rich literature; communication and media scholars would profit from giving it more attention.

The changes wrought in musical culture by the advent and growth of recording technology and the recording industry provide valuable case studies of the historical impact of communication media. This is a type of media effect seldom considered in the media and communication literature but well documented elsewhere. Space limits preclude more than a few quick examples. When music is recorded and recordings reproduced and distributed, music enters the social world as a thing rather than a process, an object rather than an event. That difference was the central concern of Eisenberg's (1987) influential book and ontological questions have continued throughout the literature (e.g., Rothenbuhler & Peters, 1997; Sterne, 2003). Philosophical concerns aside, the record travels the world, finds its audience, and registers its social effects differently than does the musical performance. Record collecting and listening

at home, for example, became the dominant activities of music lovers in the twentieth century, and this is a very different mode of musical engagement than is attending musical performances. With this change in the communicative structure of the music audience experience came a series of cultural implications and consequences, ranging from shifts in musical performance style to the development of musical celebrities and new markets for manufactured goods (Suisman, 2009). Attention to the social consequences of the physical properties of the medium has proved useful in the work of multiple authors. Katz (2004), for example, builds a convincing case that the way in which the recording medium renders the performer and audience invisible to each other gave impetus to the shift in classical violin technique between the nineteenth and twentieth centuries, from an emphasis on the bow and a steady tone to an emphasis on the left hand and vibrato as the key to artistic expression.

It is widely accepted in the literature that the influence on blues music of recording and the record business from the 1920s on was to narrow the range of stylistic variation, emphasizing a few standard song forms and narrowing the range of lyrical themes. Any of the performers from the 1920s and 1930s had a broader range of styles in their performance repertoire than in their recorded, several of them told stories of record producers wanting only certain kinds of songs, and the variation of performance styles of blues music on record narrows across those same and subsequent years (Calt, 1994; Hamilton, 2008; Rothenbuhler, 2007; Wardlow, 1998). By contrast, over those same years it can be shown that the evolution of stylistic change in jazz music increased in both speed and range (Kennedy, 1994). How can both be explained as “effects” of recording?

Here we have an example of what a statistician or logician might call a contingent effect, what Pool (1977) called a dual effect in regard to the social impact of the telephone, or what Mumford (1934) pointed out about communication technologies in general, that they multiply other tendencies. Pool pointed out that the telephone was a great power, changing our relations to space and time, but that power and its consequences were shaped by other social purposes. As a market for blues records grew it was shaped by ideas of authenticity and tradition, so the genre narrowed and hardened; only certain musical forms were accepted as authentically representing the tradition. On the other hand, jazz players and audiences alike value innovation and change, so as records allowed players to study each other’s work and audiences to grow familiar with new styles more quickly, the pace and breadth of change accelerated.

These are only a few examples of a whole literature of evidence of the social and cultural consequences of recorded music and the recording industry. For all the years of scholarship devoted to media effects, nearly no one in the communication literature has paid attention to these already documented cases.

Alongside recorded music history, another common topical orientation within the sound studies territory is film sound, sometimes with additional attention to television sound. Historical questions around “the coming of sound” have been a major issue in film studies, as have more general concerns with the role of sound in what

is conventionally defined as a visual medium (Altman, 1992; Bandy, 1989; Gomery, 2005; Lastra, 2000). Sound has come to be recognized as a specialist area within film studies, and the resulting literature defies brief review. The historical questions include the invention and development of sound on film technologies and other systems for sync-sound; competition between technologies and businesses of sound; the conversion to sound film in technology, business, and culture; the forms of sound accompaniment for silent films; and the development of technical and artistic conventions for sound film. Film scholars have also examined the roles of diegetic and non-diegetic sound and music, and the relations of dialogue, sound, and music in film practice, artistic expression, and audience experience. Of course, film scholars tend to give less attention to recording, radio, and the telephone. So, like the focus on recorded music, this choice of topical emphasis produces one type of sound studies within the wide, horizontal sweep of multi-topic, cross-disciplinary possibilities.

The tendency to focus on one medium rather than the broad sweep of sound phenomena is greatest in regard to radio. Radio history, of course, has a huge literature of its own. There is relatively little attention in that literature, though, to radio's specific status as a sound medium. Most historical work has focused on the institutions of radio, addressing issues of business, industry, markets, law, policy, and politics. Radio programming provides another focus for historical work, but here too, until the 1990s, little of the work addressed the specific contingencies and processes of audio art and expression or of the audio listening experience of the audience.

Important exceptions to these characterizations of the radio history literature began to appear in the 1990s. Douglas's (1999) *Listening In* gave systematic attention to the listening experience of audience members within a broad overview of twentieth-century US radio history. By necessity this was speculative and theoretical work, for the audience experience leaves little in the way of historical evidence. Scannell (1996) used the archival materials of the BBC and a phenomenological theoretical frame to examine how audio events were constructed in order to function as communication for the dispersed audiences of radio broadcast. This innovative work was based in part on the close analysis of strips of broadcast talk (cf. Scannell, 1991) – something on which the sociologist Erving Goffman (1981) had also focused. Talk is a form of sound for which we can fairly confidently say there are communicative purposes and implications. McCracken (1999) provides an example of close analysis of the extra-linguistic elements of radio sound for their communicative and cultural implications. She and others have shown how the singing style of crooning, produced by microphone technique, yielded a different listening audience experience, that supported a different sense of relationship with the performer, and helped produce different kinds of celebrity. Of course, like Douglas's *Listening In*, this case too depends on inference where evidence does not exist. We know what crooning sounds like and we know it was associated with the rise of a new kind of star who received new forms of audience attention. If that intimate, close-miked sound

produced feelings of close relationship with its distant and dispersed audience members, that would explain the audience behavior and connect the sound to the resulting behaviors through the communicative experience.

Radio, film, television, recorded music – each has its own literature within which sound can be a focus; the telephone too has its own literature, though it is a small one and the topic deserves more attention. The telephone companies appear in media histories as dominant players in the early research on electrical sound technologies and their uses, the development of industries, and attendant legal issues. Standard histories of broadcasting, for example, discuss the telephone companies in early chapters, and then move on to other concerns. Western Electric, for example, is treated as an important engineering firm, but once the inventions have been patented and implemented, the company drops out of the story.

More recent work focusing on the development of sound technologies as such have treated the telephone companies as having longer range, more subtle consequences than that. Part of Sterne's (2003) argument, for example, could be simplified this way. When tubes and amplifiers designed to boost voice signals in long-distance telephone wires became, or at least influenced, the standard model amplifier for radio, cinema, and electrical recording, a solution for a problem of communication in one realm became an unnoticed influence on culture in other realms. Telephone design was shaped by the goal of voice audibility and the midrange focus of the circuits they designed served that purpose. Since the huge capital of the telephone companies allowed them to dominate technological research, later companies and other media were built on this foundation, and radio and music recording of the 1920s and 1930s, for example, both ended up with the same midrange emphasis of the telephone circuits. What is even more interesting, to the extent it can be shown to have happened, is when the sound the technology affords feeds into the culture and becomes a value standard as well. This kind of attention to the deeper historical influences of the telephone technology and system has become more common in sound technology studies.

The social uses of the telephone as a sound medium, though, tend not to receive much attention in literature on recording, radio, and film. These latter became mass media and producers of public culture while the telephone became a point-to-point system for talk. But the telephone system could have developed in a different way – there were experiments with using it to deliver music to the home, for example, and telephone lines were used to deliver Muzak services and radio programming as well – and studies of its social development have proved quite rich. Pool (1977, 1983) helped bring the paucity of research on the telephone to the attention of others interested in technology, communication, and social change. Fischer (1992) provided a social history of the telephone, couching his work as a study of the role of a communication technology in the development of modern societies. Rakow (1992) illustrates another approach to the social study of the telephone, examining gender roles and networks in the processes of community life. Such issues of technology-enabled communication networks and social relations are at the heart of much recent

work on the cell telephone (e.g., Ito, Okabe, & Matsuda, 2005; Wallis, in press). Ling's (2008) work in particular makes a fascinating case for the reshaping of social orders and processes via the ubiquitous use of mobile telephones, systems that allow portable personal networks rather than geographical ones, shifting again our relations to time and space.

Music recording, film and television sound, radio history, and the telephone provide media-centric foci for sound studies. Another approach grows out of interest in communication technologies as such. Interest in sound technologies can derive from theories of the social consequences of differences among media as forms of technology. Innis (1951, 1972) and McLuhan (1964) are well-known sources here; Adorno (2002) and others too have provided a range of ideas about such differences. Those who emphasize the way that recording makes music a thing, discussed above, are working with a similar logic, focusing on the consequences of the technology as such. Such approaches can be criticized for treating the technical form as too autonomous an object, too independent a force in history; the most important alternative is to analyze the development of technology as itself a product of social activity, shaped by the work of people and institutions with their own purposes and interests. Williams's (1974) *Television: Technology and Cultural Form* is an oft-cited source for this point, while the field of science and technology studies is also widely influential (e.g., Bijker, Hughes, & Pinch, 1987; MacKenzie & Wajcman, 1999).

The science and technology studies approach emphasizes the social dynamics of invention, development, and use of technologies in general, inviting scholars to see one medium as comparable to others in this regard, and all media as comparable to any other technology. That comparative interest produces a reshuffling of the categories conventional to media studies, as in studies of the influence of telephone technology on radio, recording, and film sound (discussed above), in Gitelman's (1999) study of the phonograph as a writing machine, or Sterne's (2003) argument for the influence of the nineteenth-century stethoscope on twentieth-century ideals of fidelity.

Any one study can only do so much and attention to sound media as technologies widely comparable to other technologies has tended to reduce attention to the specifics of each medium and to its cultural and communicative content, uses, and consequences – and vice versa. The scholarship devoted to the history of music recording, like that devoted to radio history, holds many lessons for the interested reader, but the focus on a chosen medium and cultural content that produces those results, reduces the opportunity to view the medium in broader, comparative perspective. Such work can be informed by science and technology studies, though. Wurtzler (2007) began his work with a media-centric focus on the development of sound film. Following the social development of the technology, though, led him to broader study of electrical sound media, examining the commonalities and differences as the same technologies were deployed for different purposes in the different media and institutions of radio, records, and film.

Wurtzler's (2007) book also provides a good example of how choices about topical focus and analytic emphasis interact with issues of periodization. If a project on "the

coming of sound” to the cinema is centered on the sound-on-film technology that eventually prevailed, then the nineteenth-century development of the phonograph may be irrelevant – but perhaps not if the work examines the sound-on-disk systems that were competing alternatives. Similarly, if the telephone is considered a fundamentally different medium with a different history, then the years of its development and adoption can be set aside as outside the period of concern for the study of cinema sound. But as Wurtzler found, the technology and social practices of audio, and even the controlling institutional structures, shared much across the different media of recording, radio, and film – and each made extensive use of technologies originally developed for the telephone. In that case, a history of film sound can quickly turn into a history of all forms of sound technology, and become too sprawling a work for author or reader alike. Wurtzler’s decision was to distinguish the electrical sound technologies from the acoustic ones. This allowed him to devote most of his attention to the 1920s and 1930s when the use of microphones, sound studios, amplifiers, and speakers defined major commonalities across recording, radio, and film. Similarly Millard (1995) characterizes public communication, culture, and entertainment in the 1930s and 1940s as dominated by “empires of sound.” He emphasizes that not only the technologies of sound were shared across media and industries, but also corporate ownership and everything from engineers and producers to major stars and hit products moved across the media and markets of radio, records, and film. Both examples show how examination of the media and institutions can identify a network of relations and lead to a periodization unique to the study of sound media; boundaries can be drawn in historical chronology in quite different places for the purposes of explicating different topics.

Sterne (2003) takes a very different cut at history than does Wurtzler, or most other historians of sound media. His argument is that the history of the development of new listening practices is essential to understanding the history of sound technologies and their uses. Tracing out that history he finds key points of commonality and an important series of precedents from the microphone–amplifier–speaker based systems of the 1920s and later, back through the telephone, the acoustic phonograph, and various predecessors right on to the stethoscope. Each technology required, and so presumed as he emphasizes, the development of a technique of listening, and those techniques of listening have more in common than we usually think the technologies do. So his different observations of the same historical materials yielded a different logic for identifying and prioritizing the connections among events in the historical record (or vice versa), thus a different choice of topical and analytic focus, which required in turn a different periodization.

The connection of topical and analytic focus with periodization is obvious enough in the case of any individual study, as illustrated by these examples. For the field as a whole, though, it means that many books that appear to address the same or similar topics cover quite different topics and periods. More than an interdisciplinary field of sound studies, it appears we are developing several different quasi-disciplinary versions of sound studies.

Points of Reference: Analytic Terms for Socio-Technical Systems

A major contribution of the science and technology studies literature is the idea that the history of technology is not only about hardware but must also be a history of technique, social uses, discourse, and institutions. We would be better off to think of the study of socio-technical systems than of technologies as such, and this is especially important for the study of communication and media. While the technology as such may be necessary to communication and interesting to study, our primary disciplinary focus must be communicative forms and processes, media institutions, and the social and cultural implications of the communicative uses of the technology. These are socio-technical systems and in the case of communication technologies, the dynamic relation of technology, technique, and social outcomes is especially complicated.

The history of the telephone is an illustrative case. The technology could not achieve widespread adoption until the development of new social norms for its use. From the engineering point of view the telephone was a device for transmitting voice signals over a switched network. From the social point of view, it was a kind of machine in the parlor; it rang alarmingly and without polite warning; it thrust disembodied and uninvited voices into the home, and intimately into the ear; it paid no regard to age, sex, or class distinctions. It was a device for communication that did not follow any of the existing rules and expectations for communication and allowed forms of communication no one had asked for or thought they needed. The development of technique for the telephone, such as norms for greeting, leaving, and turn taking without eye contact, expectations for the proper conduct of business and personal relations by telephone – these were developments of new forms and processes of communication, necessary to, but independent of, any changes in the physical technology. Similar processes of learning how to use new communication technologies, when, where, and for what – including the technique of capitalizing on the technology and its uses, building industries to serve them – have been necessary to the development of each communication medium. What we see here is that technique transforms technologies with communicative capacities into communication media.

One conceptual frame designed to handle these issues is the “social shaping of technology” (Bijker, Hughes, & Pinch, 1987; MacKenzie & Wajcman, 1999). These scholars emphasize the process by which technologies are fitted into social orders and processes. The technical capacities of a device define a range of possibilities, within which social groups make choices, pursue some options and ignore others, are troubled by some limitations and never notice others. The physical properties of the device are “affordances” and the enacted technology of any given group can be a rather different thing. There can be a sort of redesigning of the technology in uses shaped by the values and interests of the group. This process can be seen in the social adoption of all technologies, from the steel-tipped plow to the cell phone.

While no technology can succeed as a communication medium without uses that individuals find compelling and without fitting into the communicative norms and relations of everyday life, neither have any of our communication industries resulted from accidental evolutionary processes. Regarding television, as Williams (1974) argued, we cannot understand the shape it eventually took nor its consequences for society without understanding that it was developed by businesses for business of a certain broadcasting kind. Television did have to find a normatively settled place in the US living room and network of family relations, and that process was consciously aided by the industry that profited from it too (Spigel, 1992). Similarly the efforts of the telephone companies to promulgate the communicative norms that would make their device acceptable in the home are well documented (Fischer, 1992). In studies of religious communities' adaptations of new communicative technologies, Campbell (2010) shows how other institutions can have their own ongoing influence, producing kosher cell phones and Islamic web portals for example.

Analogous to the processes of social shaping for the telephone, many possible uses of the phonograph were imagined and tried in the decades before the Victor company developed the business plan and marketing concept to build an industry of recorded music for playback in the home (Siefert, 1994, 1995; Suisman, 2009; Thompson, 1995). Today we see that industry being reshaped not by a new technology directly, but by new social uses of the technologies of digital compression, file sharing, the Internet, and portable digital music players. Here we see that the range of affordances of technologies for recorded music can have social results at odds with the industry-preferred ones.

The range of communicative possibilities for any given technology is such that historical developments of a medium and its social uses can be independent of the underlying technology. The US radio industry, in competition with television in the 1950s and adapting to the growth of car radios and transistor radios, went through a transformation of its programming, advertising strategies, and audience appeals, resulting in a very different audience composition, listening experience, and cultural role. Radio came to fit into US life in a different way, serving different cultural processes and communicative interests (Rothenbuhler & McCourt, 2002). The radio of local DJs and popular music hit-lines in the early 1960s was a very different medium from that of network serial dramas of the 1930s and 1940s. But the underlying technology of transmission and reception had not changed a bit.

These historical processes are interesting and worthwhile dynamics for any student of communication. They also present a set of challenges to anyone studying the history of sound technologies as media of communication and culture. Any such studies need an analytic system for sorting these complications, or run the risk of confusion. Wurtzler (2007), for example, distinguishes between a

Technological *apparatus* (an organized system of applied scientific principles and hardware) and the various technological *applications* through which it is deployed (in commodity forms that address real, perceived, or created consumer needs). While the synchronous-sound film, the radio, and the phonograph are quite distinct media – that is, they involved specific

technological *applications* – in terms of sound technology each is the selective arrangement of the same basic apparatus. (Wurtzler, 2007, p. 3, original emphasis)

Lastra (2000) distinguishes among devices, discourse, practices, and institutions. Sterne (2003) devotes a chapter to the processes by which “technologies [were] articulated to institutions and practices to be made media” (p. 25). Alternatives are clearly available and no claim will be made here about the right set of terms. The important point is that scholars working on sound technology need to give attention to selecting and using an analytic vocabulary that distinguishes phenomena and points of reference in the complex socio-technical systems of communication media, for the analysis of the process by which technologies with communicative capacities are developed into communication media.

It is worthwhile to look at some examples of tight fit between choices of analytic vocabulary and larger theoretical purposes. The attention Sterne (2003) devotes to the historical activities by which already existing institutions – businesses, industries, and capital interests – shaped technologies into media becomes a platform for his critique of the discourse about those media. Arguments about the cultural value of music in the home or the fidelity of phonograph playback, for example, whether in the Victor company’s advertisements or in magazine editorial copy, in his view disguised profit interests behind an attractive but impossible theory of communication. Wurtzler’s (2007) terms, apparatus and application, are well chosen for his interest in “sound technology as a transmedia phenomenon” (p. 9) and draw attention to his argument that we may have given too much attention to the social shaping and not enough to the material realities of devices as such.

To look at a different sort of example, Katz (2004) has nearly no interest in the social process of shaping a medium. His concern is with the consequences of recording technologies for musical culture, which only begin to be registered *after* recording technology is used as a medium of musical culture. While such authors as Lastra, Sterne, and Wurtzler ask how technologies came to be used the way they are, and how a medium came to be such as it is, Katz asks what difference it makes for the culture that the medium is so used. He needs an elaborate vocabulary to handle the differences of recorded and performed music and the consequences of recorded music cultures and industries, but not so much for distinguishing technology, medium, and institution. On the other hand, readers of Katz could well profit from having such distinctions in mind. For while much of his discussion is couched in terms of the effects of technology, we can recognize that in our terms he is discussing the cultural consequences of media.

Fidelity

The issue of fidelity in sound media could appear to be a concern for engineers primarily, and relatively unimportant socially or culturally. If equipment is designed

and operated to work accurately, to produce outputs that sound like their inputs, or otherwise as they were intended to sound, then it is said to have fidelity. That could be more or less the end of the story. Students of communication and culture, however, cannot fail to notice the prominent presence of “fidelity” in the discourse of audio – among professionals, in advertising and magazine articles, among consumers and hobbyists. If the phenomenon were so simple, why would it need to be talked about so much?

Indeed, studies have documented a great variety of social uses and implications of discourses of fidelity: sales strategies and advertising (Thompson, 1995), an ideological construction (Sterne, 2003), a means of expressing gender codes (Keightley, 1996, 2003), class position and aspirations (Keightley, 2004, 2008), an example of the social construction of technology and the establishment and defense of an interpretive community (Downes, 2010; O’Connell, 1992; Perlman, 2004), and the development of conventions of film sound, used by producers and audiences alike (Lastra, 2000; Wurtzler, 2007).

As another example of unintended and mostly unrecognized social and cultural implications, there is an argument to be made that the pursuit of high fidelity equipment for the home playback of recorded music in the 1950s through the 1970s nurtured also the growing social importance of recorded music as popular culture and leisure activity (Anderson, 2006; Keightley, 1996; Millard, 1995; O’Connell, 1992). The pursuit of portability, convenience, and lower cost in audio in the last couple of decades operationalized different values and has promoted other uses of music (Sterne, 2006a, 2006b). That shift of orientation is also at least correlated if not more strongly associated with declining public interest and the shifting cultural status of recorded music (Rothenbuhler, *in press*).

So fidelity is not only a matter for engineers, not just a question of accuracy in signal recording and transmission, but has larger and more remote cultural implications of a potentially diverse range, but how to analyze it? We gain traction on the problem by focusing on audio as a communication phenomenon: sound made and presented by one to another, for the other, sound intended to be heard as something. I will elaborate on this below, but first let’s examine what appears to be the simplest possible approach to fidelity in communication, and see how quickly it gets complicated, how quickly the reasons for the critique of fidelity emerge.

As a first approach we can conceive of the social importance of fidelity as primarily a question of accuracy, a social or cultural reflection of the same concerns the engineers have for the equipment. The social importance of fidelity in a business telephone call, for example, is pretty well exhausted by issues of intelligibility and accuracy. In most social settings and for most cultural uses this aspect of fidelity is necessary but it tends to fall into the taken-for-granted background of social life. Fidelity becomes more loaded and more fraught in social life, and more interesting to scholars, when it is about something more than “can you hear me now?” – to quote the slogan of a US cell phone advertisement. But even the simple case is more complicated than it appears.

The business telephone call appears amenable to a simple model of fidelity because it is a transmission system with obvious inputs and outputs, as well as, we imagine, relatively unambiguous intentions and responses. The telephone is not really a high fidelity system, but a good-enough fidelity system. Good enough on average, that is, as most anyone can attest, after misidentifying the sound of a friend's voice or trying to conduct a difficult conversation over a poor connection. So lower fidelity can interfere with social purposes and higher fidelity is not always easily set aside as a matter of mere aesthetics.

In regard to the social uses of most recording and many transmission situations, even the idea of an input or original to which an output, reproduction, or response could be compared is open to question. Since the use of multi-track tape and post-performance editing and mixing became widespread in the 1960s, popular music recordings have been constructed artifacts of musical sound rather than records of a musical performance. They are built up layer on layer for a finished product that can be received as if it were a performance, but they are not copies of the sound of a performance. One of Sterne's (2003, 2006b) primary themes is that what we see here is not just that the recording is not a copy of a performance, but that the performance is *for* the recording. It has no independent status, which introduces logical problems for a test of fidelity (truth or knowledge) that depends on comparing a result with that original. The same is true, we can add, of apparently simpler transmission situations like the way we listen to the radio signal of the DJ talking into a microphone and playing records, or for that matter, the person talking on the telephone: There again we see that there is no original that is independent of our social uses of the medium. So the question of fidelity cannot be quite so simple as testing the accuracy of the system by comparing independent inputs and outputs, autonomous originals and reproductions.

The reception end is complicated too, because of the phenomenon Altman (1992) called the material heterogeneity of sound. Sound, being a physical phenomenon of vibrations in objects and air, is always affected by the position and space of performance, the position and space of recording, the position and space of playback, and the position and space of hearing. The sound of an oboe will be different if it is played in a large or small room, a resonant or dry room, and played in one or another end, the middle, or a corner of any of those rooms. Instruments that make more harmonically complex sounds, like a piano, will be more affected. Different recorded sounds will result from using different microphones or placing them differently or in any of those different spaces. Similarly, a recording played back through equipment that is positioned in different ways or in different rooms will sound different – even leaving out the phenomenon we all know, that the same recording can sound startlingly different on different home stereos, or an office computer, or different headphones or portable players.

Finally, the placement of the listening audience member in that room matters as well, with different sound resulting from sitting in the middle, against a wall, near a corner, etc., as well as sitting in resonant or absorptive, large or small rooms. The

result is that no two sounds are the same; they are, in Altman's terms, materially heterogeneous. In sum, reproduction and reception is always a singular event, each case unique, and so "the" fidelity of any given system depends on the moment of its use and the attention of its users.

These observations give rise to a prominent critique of fidelity. If recorded music, film sound, radio programs, and so on are not copies of an original, but unique, constructed artifacts, and then not independent of the recording, transmission, reproduction, and response, but tied to them in a single social system, and on top of that each moment of reproduction and reception is its own unique event as well, then how does "fidelity" apply? To what "original" can we compare which instance of reproduction? And if fidelity in the sense we appear to use the word is not possible, maybe not even logical, what does it mean that it continues to enjoy such prominent use? Why is fidelity still used to organize professional work, to sell products, in consumer literature, and by audience members? This line of thinking leads to three positions in the literature, presented as alternatives though not entirely mutually exclusive.

One position is a critique of fidelity as an ideological construction; it is an impossible concept and misapplied to media. It serves to distract audiences from the actual profit and power relations of the consumer goods and culture industries through the invocation of an attractive but false theory of communication. This is Sterne's (2003) well-known critique and it is widely accepted in the literature. While the historical record of the industrial exploitation of the concept of fidelity is clear, and deserving of critique, this position has the classic weakness of ideological explanations. Other than an abstract reference to power and distraction, it offers no explanation for how the false concept endures.

A second position views fidelity as a social construction and focuses analysis on how it is used in different settings for varying social purposes. Lastra (2000) and Wurtzler (2007), for example, focus on professional debates among film sound engineers and show how recording practitioners constructed a professional practice of sonic manipulation for producing recordings with sound that (a) counts as fidelity in professional circles, and (b) follows conventions that audiences can decode. Doyle (2005), Gracyk (1996), and others have shown similar processes at work in record production.

Another use of the social constructionist approach examines fidelity in what we might call domestic practice. Keightley (1996, 2003, 2004, 2008) has provided a series of studies documenting the gender and class coding of household technologies, the television versus the hi-fi, for example, and the use of hi-fi to claim domestic space for masculine pursuits. Keightley is not alone in focusing on hi-fi hobbyists and he and other scholars (Downes, 2010; O'Connell, 1992; Perlman, 2004) have shown two interconnected processes among these audio fans. One is the social construction of technology, by which a social group adapts, redeploys, or even redevelops a technology to its own uses and values. Some CD players, for example, are received as and used for higher fidelity than others, thus requiring that they be deployed and used

differently. The related process is the development and defense of a discourse community or interpretive community, so that a network of high fidelity enthusiasts, in touch with each other through magazines, stores, social events, and the Internet, can share a vocabulary, set of interpretations, values, even epistemologies and knowledge claims. These analyses of the social construction of fidelity provide explanations for its endurance, by showing its social utility to those who engage in the discourse.

Most of these studies of the social construction of fidelity still arise, like the ideological critique, from a hermeneutics of suspicion and retain the implications that fidelity, because constructed, is false and its uses likely to be invidious. Both may be true in any given situation, but they do not have the logical foundation to stand as *a priori* truths; as implicit presumptions they too often steer our analyses toward the foregone critique. One cannot help noticing, for example, that while fans of high fidelity equipment and recordings offer a fascinating case study, the literature on them is almost hostile. Where studies of fans in most other domains are entirely accepting, even celebrating their creative engagements with media and culture, audiophiles seem to inspire dismissal and ridicule from academics.

In order to solve these problems I have advocated a third position on fidelity which accepts the analyses of the social construction of fidelity, and Sterne's critique of the industrial exploitation of the concept, but not the implication that fidelity is therefore false and wrong. This position takes fidelity as a social reality, recognizing the reality of socially constructed phenomena (Peters & Rothenbuhler, 1989). Evidence that a concept is socially constructed is not evidence that it is false, ideological, or somehow less true than other concepts that are purportedly not also socially constructed – indeed, all concepts are, including those used in the critique. The analyst's job is to step inside the logical circle and understand the world constructed there, as it is there. This approach explains the widespread use of the concept by its usefulness, seeing fidelity as a term for organizing and evaluating communication.

Indeed, to the extent there is a culture of audio, hence a culturing of audio, fidelity is a key term. Reference to the ideal of fidelity is one of the ways that some sounds are distinguished from others, signal from noise, and hence registered *as* audio. Audio, as a selection from the world of sound, is defined in relation to a listener; it is sound that operates as a sign of something for someone. In this sense audio is *for* the listener, hence a phenomenon of communication and never simply a matter of physics or engineering. Fidelity, as part of the culture of audio, is a key term for evaluating the relations implied by listening to something in order to connect communicatively with another experience recorded or transmitted elsewhere.

In this view the fact that the recording is a constructed artifact for an audience and not a record of a performance is not only not a problem, it is the key to the solution. For Sterne and others, recognizing the record as a constructed artifact shows that there is no original and thus "fidelity" to an original is a logical impossibility; anyone, then, who claims fidelity either does not understand it or is up to mischief. For the communication perspective advocated here, recognizing that the record is a constructed artifact designed to be played, shows it to be a communicative

performance, for an audience. As Hymes (1975) defined the breakthrough into performance, the acceptance of responsibility for the display of communicative competence, all that Sterne's critique of "no original" does is displace the original and reassign the responsibility, from the artifact to the communicator.

Conclusion

By way of brief conclusion let me restate a short series of points given passing mention above.

Whether sound studies is or should be a singular field remains an open question (Hilmes, 2005). On the basis of this review it would appear to be trending away from that possibility, from a wide-open interdisciplinary territory to geography marked off by several different quasi-disciplinary fields. Sound studies not only have different topical orientations, they are conducted somewhat differently, too, by those who focus on film, music, radio, telephone, or technology as such. Too much missing is communication as such.

Our disciplinary focus should be communication and the sound studies literature would benefit from more sustained attention to audio technologies as communication media. A few of the questions that could follow have already come up here. We need to examine the processes by which technologies *become* media; these are rich, complex, worthy of study in their own right, and illuminating to other problems of communication and cultural theory. Focusing on technologies in use *as* media provides an analytic lever as well as a disciplinary anchor. The question of fidelity, for example, is rendered answerable by shifting to a communication-centered analysis. In studying the *consequences* of sound technologies in use as media communication scholars may make important contributions to the sound studies literature and bring rich, new materials into the study of media effects in the communication literature as well. These are only a few important issues in what remains an intellectual territory rich in possibilities.

Television

Laurie Ouellette

ABSTRACT

This chapter traces the history of television in the United States in relation to broader societal conditions and changes. Rejecting the assumption that technological advances are inevitable or necessarily progressive, it situates evolving “stages” of television as complex responses to the shifting demands and contradictions of advanced liberal capitalist democracies. Events and ruptures in television’s development as a cultural form are discussed in the context of three conjunctures – *mass* television, *niche* television, and *post* television. At a moment of dizzying technological change, the chapter emphasizes the importance of history and the need to look beyond the shiny surface of the new, to consider how the transformation of broadcasting intersects with a broader reconfiguration of the “social forms” (work, family, geography, market, government) in which we live.

Television is a medium in transition. The era when a few major networks beamed the same programs into everyone’s homes has given way to hundreds of specialized cable channels, digital video recorders, programming “on demand,” new distribution and viewing platforms (DVDs, websites, mobile phones), and more opportunities for viewer interaction, from voting on talent competitions to posting clips on YouTube.

In light of current developments, the history of television as a mass medium can seem increasingly distant, and perhaps irrelevant. The assumption of cultural progress encourages this view, evoking the past as a barometer against which dazzling improvements in consumer choice, interactivity, and gadgetry can be measured. While television has changed substantially, the tendency to celebrate the “new and improved” can be shortsighted and unhelpful. After all, our ability to historicize the present may be our greatest resource for thinking critically about the future. As the cultural theorist Raymond Williams observed some time ago, media technologies do not emerge or “evolve” spontaneously: they are shaped by the *social formations* in which they operate. Taking a cue from Williams, this chapter traces the genealogy of television in relation to broader societal conditions and changes. Rejecting the assumption that technological advances are inevitable or necessarily progressive, it situates the evolving “stages” of television as complex responses to the shifting demands and contradictions of advanced liberal capitalist democracies.

What follows is not a comprehensive history of television, but a mapping of events and ruptures in television’s development as a cultural form (particularly in the United States). These are grouped into three conjunctures: *mass* television (1940s–1970s), *niche* television (1970s–1990s), and *post* television (2000s–present).¹ While there is a chronology to this map, the conjunctures are also densely layered, and elements of mass television coexist with the move toward increased specialization, flexibility, and innovation. What matters is the dynamic relationship between television, history, and society. At a moment of dizzying technological change, it is important to look beyond the shiny surface of the new, and consider how the cultural transformation of broadcasting intersects with the broader reconfiguration of the “social forms” (work, family, geography, market, government) in which we live. As Williams indicated, this will require a very different way of thinking about a medium in transition.

Mass Television

In his 1974 book *Television: Technology and Cultural Form*, Raymond Williams considered why television emerged in the West in the cultural form it did. While experiments in public reception and two-way transmission occurred, the model that prevailed in Europe and the United States coupled centralized production with wide distribution to individual homes. The “economic incentive” to develop broadcasting certainly favored such an arrangement, as profitability hinged on the mass manufacture and consumption of domestic receivers and, in the United States, the sale of advertising. On a broader scale, Williams saw broadcasting as the quintessential cultural technology of industrial capitalism itself. From the domestication of radio in the 1920s to the saturation of television in the 1950s, broadcasting was uniquely synchronized to social tendencies and tensions set into motion by the industrial

factory system. These include migration, urbanization, the decline of extended kinship networks, the expanding distance between centers of public activity (such as government and paid work) and domestic life, and the rising importance of the autonomous and “self sufficient” single family home. While radio paved the way, television, more than any medium, complemented a paradoxical “new way of life” characterized by increased mobility on one hand and privatization and isolation on the other. Bringing the outside world into the home, television relieved some of the “contradictory pressures” of *mobile privatization* and structured everyday domestic life around its own temporal and spatial flows (Williams, 1992, p. 20). This was not a matter of television possessing essential attributes or creating “new social conditions,” which implies that technology drives historical change. For Williams, television’s formative conjuncture was the cultural outcome of a host of new “needs and possibilities” generated by the emergence of industrial capitalism and its complex social forms (p. 13).

While the development of broadcasting on a broader global scale evidenced cultural tendencies identified by Williams (particularly the model of centralized distribution to private homes), there were crucial differences. In the United States, broadcasting was developed and operated by private corporations, with minimal government oversight. In Europe, on the other hand, broadcasting was developed by state agencies (such as post offices) and eventually managed by tax-funded, public broadcasting bureaucracies. Until the 1950s, commercial television channels were not allowed in the United Kingdom and many other European countries. National broadcasting systems funded through taxes and/or state resources also dominated in India, Latin America, and Asia until the proliferation of satellite technologies and the push toward market liberalization in the 1980s changed the television landscape on a global scale. Today, commercial operators who are generally multinational in scope compete with non-profit national broadcasting systems in most parts of the world except the United States, where all broadcasting (even the modest quasi-public channel, which accepts advertising) is arguably commercial. Each national context presents a unique set of social conditions to the study of television history. Some of these national differences involve alternatives to mobile privatization, from the practice of communal television viewing in rural India and the use of broadcasting during public rallies in Nazi Germany. However, central dissemination (whether by public bureaucracy or private corporation) and private reception took hold across geographical sites, and in no place were the broader social tendencies and contradictions associated with this *particular* and *prevalent* (but not inevitable) model of broadcasting more acute than in the United States.

The best historical scholarship on US television shares Williams’s concern with broader societal contexts. Whereas Williams identified television’s pivotal relationship to mobile privatization, other historians have specified how the medium’s development coalesced with the sexual division of labor, the rise of suburbs, racial and class hierarchies, the expansion of consumer culture, and the tensions of a particular stage of liberal democracy. In so doing, they have shown how the basic characteristics

of mass television – centralized distribution, ritualized domestic viewing, regional and national networks, programming addressed to a broad audience, and a “scarcity” of channels – emerged in relation to the aims and contradictions of postwar capitalist societies. In *Make Room for TV: Television and the Family Ideal in Postwar America* (1992), Lynn Spigel traces how the “social construction” of television as a mass medium coalesced with assumptions about women’s work inside the home. Television’s flow into the home punctuated everyday life in synchronicity with prevailing ideologies of gender and leisure. Daytime television was geared to women who were assumed to perform domestic chores such as cleaning, cooking, and household planning while they watched, followed by afternoon programming for children. While primetime was presented as the family hour, advertisements showed fathers relaxing in easy chairs, while mothers combined casual television viewing with the ongoing labor of homemaking and caretaking. These representations reinforced gender roles while also teaching women (as the presumed guardians of family life) how to incorporate television into its existing practices and routines. The gendering of bifurcated public and private spheres since the Victorian era also shaped television’s cultural priorities, says Spigel. Promoted as an alternative to public recreations, television invited men as well as women to access the historically male-coded “outside world” from the comfort and privacy of one’s home. Tellingly, anxieties about the medium’s feminizing effects on people circulated in cartoons and other popular media depictions of emasculated male viewers. While the jokes reinforced sexist ideologies, television was a feminized medium – not because of any innate attributes or technological biases, but because its cultural form and address were so closely connected to feminized domestic spaces and routines. Designed to be watched for hours on end in a semi-“state of distraction,” all television was synchronized, in some sense, to the assumed habits and dispositions of multi-tasking housewives who were also the imagined consumers of the goods it advertised.

Television’s mutually constitutive relationship to suburbanization and postwar consumer culture is further explored by several important studies. In “Sitcoms and Suburbs” (1989), Mary Beth Haralovich situates an enduring television genre – the family sitcom – within a broader assemblage of technologies for shaping and managing social life. In constituting white middle-class suburban families as the “normal” achievement to which everyone was supposed to aspire, television also provided a national cultural platform for showcasing the latest home appliances, furnishings, and consumer goods. Behind the scenes, television functioned as an informal testing ground for the emerging science of marketing and product design. Providing a “picture window” into the idealized consumer lifestyle of the suburban family, sitcoms supported aggressive campaigns by government and private industry to return women to domesticity after their recruitment to the workforce during World War II (interestingly, while fictional housewives decked out in pearls and heels learned to embrace their “natural” domestic role to various degrees, they were never shown actually doing housework). As Haralovich points out, television’s cultural output complemented federal housing policies that encouraged white middle-class suburban

settlement and, through “red-lining” policies, discriminated against African Americans. In this respect, television was more than the ritualized flow of information and entertainment into the home. Sitcoms simultaneously modeled and mobilized the objectives of a dispersed range of public and private institutions, including population migration, racial segregation, the formation of nuclear families, and a lifestyle predicated on the consumption of goods.

In “The Meaning of Memory: Family, Class, and Ethnicity in Early Network Television Programs” (1986), George Lipsitz examines the collaborative efforts of US government officials and business leaders to increase consumer spending in the wake of the Great Depression and World War II. Mass consumption was encouraged as a stimulus to economic growth, and as a way to temper the working-class radicalism and labor unrest of the 1930s and 1940s. Television’s officially sanctioned positioning as privately operated, nationally networked, advertising-sponsored entertainment medium encouraged people to purchase the proliferating products of industrial capitalism, and seek gratification from consumption rather than political organizing or work. The informal “lessons” about the emergent consumer lifestyle that infused so much television programming of the 1950s complemented television’s institutional relationship to the growth of consumer capitalism. Lipsitz analyzes the short-lived urban ethnic working-class comedies of the postwar period as an example of television’s participation in the moralization of consumer values. In these sitcoms, characters marked by immigrant status, extended ethnic social networks, and the lived experience of scarcity and rationing learned to “let go of the past” and consume without anxiety (often on installment plans) as a sign of modernization and Americanization. While the programs negotiated residual understandings of increased spending as hedonistic and unwise, they ultimately nudged even the most unlikely and resistant individuals toward a new ethic of consumption. Through this implicitly white and middle-class ethic, these comedies also exemplify what Herman Gray calls television’s constitution of an “imaginary middle.”

In *Watching Race: Television and the Struggle for Blackness* (1995), Gray traces mass television’s historical investment in racist ideologies and practices. This manifested in representation of Black people as inferior, dangerous, and subordinate “others,” and in the medium’s address to a broad audience imagined as white, educated, and middle class. During the period when only three networks competed for the largest audience share possible and specialized cable channels didn’t exist, racial difference was relegated to the margins of television programming or avoided altogether. A similar appeal to a “naturally” white imagined center characterized much consumer culture during the Fordist stage of capitalist production, named for the emphasis on the mass production of goods for an undifferentiated market. In the documentary film *Color Adjustment* (1992), Marlon Riggs shows how mass market logic and racism coalesced in the few representations of African Americans on broadcast television from the 1950s to the early 1980s. Even as the civil rights movement opened the door to cultural reform, “positive” images were typically conceived from a white middle-class perspective and designed to flatter the sensibilities of the imaginary middle. The

proliferation of *niche* television (including programs and channels pitched to African Americans) since the making of *Color Adjustment* speaks to the segmentation of the mass market, the development of cable as a vehicle for niche programming, and the realization that diversity can be profitable. As will be discussed in more detail in the following section, the transition to a more flexible post-Fordist mode of production, and the “posting” of movements for social equality, have also brought a new set of struggles to racial representation.

The TV Problem

While *mass* television complemented the broader social dynamics of the postwar era, it was also problematized from the outset. The same attributes – centralized production, broad dissemination, mass consumption, ritualized domestic reception – that made television so “functional,” also magnified the contradictions of consumer capitalism and triggered anxieties about the medium’s relationship to liberal democracy. As Graham Murdock (2005) points out, the term *broadcasting* originally stemmed from the agricultural practice of a farmer scattering seeds, “throwing them out in a broad arc, in an effort to spread them as widely and evenly as possible” (pp. 174–175). The farm metaphor took on increasingly negative connotations as television became closely associated not only with wide distribution, but with the presumed attributes (low taste, homogeneity, passivity, unruliness) of so-called masses as a social grouping. As Williams argued, television’s problematic affiliation with mass culture and the mass audience was steeped in assumptions about the working-class “mob,” despite the fact that it (unlike cinema and other urban recreations) did not assemble a physical massing of people. By bringing a ritualized flow of entertainment into the home and fostering privatized domesticity and consumption, television discouraged the coming together of populations in public. Nonetheless, the TV Problem, as it was known in the United States, characterized television as a serious threat to cultural standards as well as “enlightened” citizenship. The terms of this problematization can be traced to the “irresolvable” contradictions that Michele Hilmes observes at the heart of US broadcasting. In *Radio Voices: American Broadcasting 1922–1952* (1997), Hilmes points out that the private corporations that controlled radio were held accountable to an ethic of public service interpreted as the transmission of legitimated knowledge and culture. On the other hand, broadcasting was a business that profited from the sale of advertising, and therefore the ritualized listening of as many potential consumers as possible. When popular entertainment became the leading conveyor for the movement of merchandise, broadcasting became the target of intellectual contempt, as well as grave concerns about its poisonous impact on democracy. When television emerged at the center of postwar culture and society, the residual tension between high expectations of public service and the commercial drive to manufacture popularity resurfaced with a vengeance.

The consumer boom was partly responsible for this escalating tension, to the extent that it freed up intellectuals (including critics, academics, policy advisors, and professional thinkers) to ponder new pressing problems that coalesced around the quality and homogenizing effects of mass culture. In "A Matter of Taste: Corporate Cultural Hegemony in a Mass Consumption Society" (1989), Jackson Lears proposes that the growth of public universities and the expansion of the white-collar professional middle class, composed of college-educated people who increasingly worked with knowledge instead of "making things," made it easier to displace "questions of power" onto cultural symptoms. Intellectuals of various political stripes took the level of mass culture as demonstrable proof that the upwardly mobile people needed (and perhaps secretly wanted) the "guidance of a cultural elite." Vance Packard summed up this sentiment in his journalistic account of *The Status Seekers: An Exploration of Class Behavior in America* (1959). "In modern America, where especially at the consuming level the masses have to a large extent become the dictators of taste, we have to endure the horrors of our roadside architecture and billboards; our endless TV gun-slinging; our raw, unkempt, blatantly commercialized cities; our mass merchandising of pornographic magazines; our faceless suburban slums-to-be; our ever-maudlin soap operas," Packard wrote. "Voices have been crying out for the restoration of some kind of elite that can set standards and make them stick" (pp. 327–328).

Similar thinking prompted the 1960 President's Commission on National Goals to declare that US mass culture was in a state of emergency. The report included a scathing assessment of "The Quality of American Culture" by August Heckscher, the president of the 20th Century Fund, a prominent New York City philanthropy. Heckscher chided the media for abandoning their public interest obligations by pandering to an "audience eager for fourth-rate material" (1960, p. 128). He further worried that rising postwar affluence had not spawned higher levels of cultural sophistication in the mass public. On the contrary, US citizens had become a "great mass prepared to listen long hours to the worst of TV or radio." Paradoxically, if the hoi polloi were setting the sights for broadcasting, the mass market was simultaneously "virtually abolishing" class distinctions, making the United States a little too close to communism for this Cold War critic (p. 131). Indeed, the TV Problem, as Michael Curtin argues in *Redeeming the Wasteland: Television Documentary and Cold War Politics* (1995), emerged just as social scientists and cultural critics were embracing the United States' commitment to liberal pluralism as the "distinguishing difference between free societies and totalitarian ones." Mass culture – especially primetime television – was not easy to reconcile with this theory. Yet, burgeoning anxieties about the medium's homogeneity had nothing to do with television's presentation of prosperous white middle-class suburban families as the national norm, to the exclusion of everyone else. Tellingly, Heckscher's (1960) dismay at seeing everyone offered the "same culture" on their television sets was rivaled only by his alarm that "women at different levels of income dress indistinguishably" and that the "most luxurious housing units boast the same dish washing machine available in almost any

worker's home" (p. 131). This defensive response spoke to a perceived blurring of class differences and, more broadly, to the social authority they bestowed on "tasteful" people like well-educated foundation presidents.

To be sure, some institutions tried to harness television as an instrument for enlightening the public, raising the level of taste, and creating the "right kind of citizens." Championed by social scientists, universities, and private foundations, a smattering of (deeply marginalized) educational radio and television stations had emphasized edification since the 1920s. Higher profile initiatives were also pursued. In *The Citizen Machine: Governing by Television in 1950s America* (2010), Anna McCarthy traces some of the earliest "public interest" objectives carried out by the major broadcast networks in partnership with sponsors and major philanthropies such as the Ford Foundation. Their approach to the public interest as a matter of corporate social responsibility exemplifies the broader regulatory framework in which broadcasting developed. In *Selling the Air: A Critique of the Policy of Commercial Broadcasting in the United States* (1996), Thomas Streeter shows how "corporate liberalism," a system of governing in which state intervention in social life is downplayed and corporations are rationalized as the neutral arbiters of diverse interests, underscores broadcast policy, particularly in the United States. In Europe, most nations created centralized, tax-funded, non-profit public broadcasting bureaucracies to operate as mass cultural technologies of education and citizenship. The United States, on the other hand, equated "freedom" so closely with the market that any state involvement in the operation of broadcasting (except to orchestrate private control and make suggestions) was suspect. Commercial broadcasters alone were licensed to handle the day-to-day operations of serving the "public interest, convenience and necessity." Both the European and the US system presumed the near-universal distribution of signals to individual homes, and both were top down to the extent that regulatory policies and programming decisions were made *for* the people, not *by* them. The difference was that broadcasting in the United States was expected to fulfill the needs of postwar liberal democracy, while also turning a profit. When it became clear that these priorities could not be reconciled, the impetus for reform gained urgency.

Chronicling this impetus in *Viewers Like You? How Public Television Failed the People* (Ouellette, 2002), I show how intensifying anxieties about mass culture in the United States shaped blueprints for "better" television. In a famous 1961 speech to the National Association of Broadcasters, Newton Minow called television a "vast wasteland," coining the instrumental metaphor for the medium's reform. The speech spoke to the widening social and cultural contradictions of postwar capitalism but did not address their messy origins. For example, Minow did not question private ownership, treating television's "screaming, cajoling and offending" ads less as structural determinants than as cultural offenses. His critique of "assembly line entertainment" geared to a mass audience spoke to television's redundancy and lack of innovation – but it also evoked critical sociologist Pierre Bourdieu's (1984) assertion that the ranking of culture is always related to the ranking of people in capitalist democracies. When Minow (1961) told broadcasters they must present a "wider

range of choices, more diversity, more alternatives,” he evoked pluralist ideals, but took for granted that diversity meant *upgraded* programs imbued with legitimacy, such as live plays and panel discussions. Minow overlooked television’s failure to serve every minority except one: (implicitly) white college-educated people with respectable tastes. Because the mass audience was characterized as unsophisticated and hedonistic compared to professional middle-class “opinion leaders,” the TV Problem took on political connotations as well, as Edward Murrow, host of the acclaimed (but cancelled) news program *See it Now*, implied when he claimed that the majority desire for mass amusement jeopardized “the virtue of the republic if not the security of Western democracy” (cited in Baughman, 1985, p. 30). As James Baughman (1985) has shown, anxieties about the decline of television journalism signaled a widening “crack” in the liberal corporate faith that broadcasters could be free marketeers *and* serve the public interest as interpreted by reformers. Television and its audience were implicated in what Toby Miller (1993) calls the conflicting demands of the consumer economy (selfishness, pleasure, indulgence) and the political order (ethics, discipline, civic duty). This logic, in turn, further alienated the “people” from the presumed requirements of democracy. As one reformer put it:

We are in trouble as we unconsciously confuse the interests (tastes) of the public with the public interest, which is what broadcasting, under law, is charged to serve. For the public interest has little to do with our appetites and desires, however widely shared. It has everything to do with our needs, as human beings and citizens of this democracy. In both realms our whims and appetites must be subordinate to our needs and duties. (Siepmann, 1964, p. 4)

As the TV Problem escalated, philanthropies flush with the surplus of industrial capitalism – especially the Ford and Carnegie Foundations, which were funded by the estates of moguls Henry Ford and Andrew Carnegie – mobilized for an alternative program service, providing the stimulus and seed money for what eventually became the Public Broadcasting Service (PBS). The interventionist approach to social welfare that emerged with the Great Society programs of the 1960s also made it possible to rethink television as a technology of public education and citizenship formation more broadly. Federal investment in public education, health, and welfare rose dramatically during the 1960s in response to the demands of the emerging information economy, the Cold War, the “discovery” of poverty, civil rights organizing, and percolating social unrest. Subsidies to the arts expanded as well, reflecting a national commitment to a New Frontier of aesthetic and cultural values deemed unachievable through existing market mechanisms. The Great Society era’s concern with raising the quality of life in the United States, equalizing educational opportunities, and improving people’s capacities also placed a new premium on broadcasting as an instrument for maximizing human capital and instilling higher standards of excellence. Commercial television’s refusal – or inability – to allocate resources to these goals prompted President Lyndon B. Johnson and eventually the US Congress

to support the idea of a non-commercial public broadcasting system (Ouellette, 2002). With a broader national mission than “educational” television, US public television would disseminate what Graham Murdock calls “cultural resources for citizenship” – informal education, civic training, cultural enlightenment, opportunities for self-improvement – in tandem with the expanding social and educational services provided by the US government during the Great Society period (Murdock, 2005, p. 186).

Slotted as the “oasis” of the wasteland, its creators expected PBS to pursue a different mission entirely. Since the commercial networks were criticized for pandering to mass appeal, PBS was called upon to bring “excellence and diversity” to the airwaves, while also recasting the worrisome mass audience as a fragmented array of specialized interest and taste groups. PBS was regarded as a natural home for well-educated populations with advanced cultural tastes and opinion-leading capacities – the “minorities” deemed least served by the mass approach to television operating across commercial channels. Predating the arrival of cable television, it developed as the original niche channel, a home for “quality” television with an educational twist, synchronized to professional upscale lifestyle clusters. Yet, because PBS relied in part on tax funding, it was also expected to uplift disadvantaged populations and facilitate more enlightening and purposeful uses of television among all US citizens. Expected to protect a small slice of television from the ravages of commercial mass culture, provide programming for sophisticated viewers, and improve the public as a whole, PBS operated as a distinguished and redemptive – but deeply marginalized – niche channel rather than a major broadcaster such as the BBC and other European broadcasters. (Likewise, the problematization of mass television worked differently in the United Kingdom. Criticisms focused on the paternal cultural authority of the BBC, and pleas for diversity often hinged on the development of commercial channels offering popular alternatives, including some US imports, to what the national public broadcaster offered.)

While the passage of the 1967 Public Broadcasting Act signaled a reinterpretation of the state’s role as financial partner in the mobilization of television as a social and cultural force, a mixed system of funding sources – including Congressional appropriations, viewer donations, philanthropy, and corporate sponsorship – tempered the “socialistic” tendencies ascribed to European public broadcasting and authorized PBS’s pioneering role in bringing upscale niche marketing to television. To avoid the centralized power ascribed to state-operated broadcasting as well as the US broadcast corporations, public television itself was also fragmented to the greatest degree possible, composed of the Corporation for Public Broadcasting, hundreds of stations, and PBS operating as a new national program service rather than a traditional broadcast network. Because PBS was developed as a corrective to commercial television and its imagined audience, its relationship to the people it claims to represent always has been contradictory. On one hand, PBS introduced programming not tied to the imperatives of advertising, a more diversified system of cultural production (with content suppliers outside the entrenched Hollywood system), and early experiments

in public outreach and interactivity (from the distribution of educational resources to the staging of mail-in votes on political debates). Yet, PBS has also been positioned outside popularity, with the exception of its children's programs, culturally tied to "influential" viewers' disproportionately high incomes and education levels. Indeed, because of this association, PBS has been vulnerable to campaigns to downscale the "welfare program for the rich" that began almost immediately, with politically motivated Republicans at the helm. Since the 1990s, the rationales for public television have lost import across partisan lines. As the number of broadcast and cable channels has proliferated, the notion that PBS requires public subsidy to correct market deficiencies has been difficult to sustain, and the US government's retreat from the 1960s has thrown the Great Society's uplifting aspirations for PBS into flux as well.

Niche Television

Diagnoses of the TV Problem shared an aversion to mass culture rooted in the contradictions of postwar capitalism. Broadcasters' quest to maximize profits was sanctioned by free enterprise – yet spawned cultural products that mocked the nation's claim to pluralism and ignored the taste and authority of the white, educated, male bourgeoisie. Commercial television was perfectly in sync with the "fun morality" noted by sociologists of the day, and thus helped circulate the values (enjoy! indulge! spend!) of the consumer economy. Yet, its perceived association with hedonism, passivity, and mental escape also clashed with ideals of enlightened citizenship, the competitive image of a world superpower, and the ethic of hard work and self-improvement long associated with the American Dream. While commercial television was encouraged and valued as the engine of the consumer economy, its cultural output was increasingly deemed at odds with the core liberal attributes – individualism, pluralism, self-governance, robust civil society – ascribed to liberal democracy in the West. Television's standardization, homogeneity, and association with a mass audience also triggered anxieties rooted in Cold War ideology, despite the medium's presumed centrality to the privacy and "freedom" of the imagined white middle class.

In the United States, the solution – public broadcasting – was marginalized and unable to challenge commercial network hegemony. However, PBS anticipated the rise of more and more *commercial* niche channels geared to specialized audiences. By the early 1970s, the same broadcast networks that once defended the "vast wasteland" began counting more than just eyeballs, partly to appease commercial sponsors. At a time when young, urban, upscale professionals were assumed to be dropping out of a mass audience coded as elderly, lower-income, unsophisticated, and rural, the quest for more precise knowledge about viewer demographics emerged. Broadcast television's experiments in "quality" and "relevance" were closely connected to its attempt to attract the "right" consumers sought by advertisers. As Jane Feuer points

out in *MTM: Quality Television* (1985), the emphasis on improving commercial television's quality (exemplified by the *Mary Tyler Moore* show and its spin offs) brought reflexivity, character development, and a nod to the feminist movement of the 1970s into the sitcom format, while Norman Lear's production company dealt more "realistically" with racism, poverty, and the women's movement in a number of socially relevant comedies including *All in the Family*, *Good Times*, and *Maude*. Both strands of programming enabled network television to reach the youthful "class" audience sought by advertisers, as well as the broad viewership historically associated with television. By the end of the decade, however, commercial cable and satellite technologies were being positioned to reorganize television and "break up" (Turow, 1998) the mass audience much more decisively.

Why did this break up occur when it did? Why were choice and diversity characterized as cable television's "natural" properties, when for years the technology had been used to bring broadcast signals to remote areas? Why were satellites adopted for domestic as well as international television transmission and reception? Following Williams, we might characterize a second conjuncture – niche television – as a cultural response to tensions and transformations in the capitalist societies of the West. These include the segmentation of the mass market, increased individualization, the reconfiguration of women's work, the marketization of social life, the commodification of identity-based movements, and the rising currency of consumer and lifestyle based forms of citizenship. Globalization, deregulation, and the expanding markets/territories of Western media conglomerates are crucial factors as well. Television's relationship to these intersecting and sometimes contradictory developments is brought into focus by a number of important historical studies.

In *A Consumer's Republic: The Politics of Mass Consumption in Postwar America* (2003), Lizabeth Cohen situates the impetus for narrowcasting within the expansion of postwar consumer capitalism. The quest for profit maximization led to a search for new markets that included other nations as well as untapped populations and lifestyle clusters within the United States. Just as consumer goods were customized for increasingly differentiated markets, so too was television. Within a context of capitalist expansion and growth, the masses were reconceived as an infinite array of consumer "niches" that could be known through more and more refined market research. Marginalized groups (including African Americans) were more fully embraced as distinct markets and emergent social identities (such as the independent woman) made possible by the social movements of the era were sold back to consumers as specialized consumer choices. As information, culture, and brands became the leading "immaterial" commodities produced by capitalism in the West, what sociologists call individualization, or the further decline of traditional social networks and the rising imperative to "choose" and express one's own lifestyle and social identity, intensified. Not surprisingly, as Lynn Spigel demonstrates in *Welcome to the Dreamhouse: Popular Media and Postwar Suburbs* (2001), portable television technology also appeared, promising each family member the "freedom" to customize his or her own viewing rather than watching together in the family circle.

With the fragmentation of consumer culture in general, proliferating brands of television became another resource for differentiating and defining identity and lifestyle. At this stage, the problems of quality and diversity that had plagued US broadcasting were deemed “solved” through a deregulated media economy. The expansion of the broadcast and cable market was encouraged as a means to viewing flexibility and increased consumer choice. While many alternative organizations (including community and countercultural activists) endorsed the development of cable, the logic of reform through increased competition and choice anticipated the Federal Communications Commission’s wholesale embrace of free market policies in the 1980s under the leadership of Ronald Reagan appointee Mark Fowler, who famously rejected any notion of television as a public cultural resource and approached the medium as a business like any other – a “toaster with pictures.” As James Hay and I point out in our analysis of stages of media regulation in the United States (Ouellette & Hay, 2008), this logic disrupted the fraught legacy of the mass audience by enabling network and cable brands to become the basis for viewers’ investment in more narrow forms of association and membership. At the same time, ideals of liberal education and uplift through unprofitable public interest broadcasting gave way to the profitable *empowerment* of collectivities conceptualized as taste and lifestyle clusters and to shaping citizens through these consumer technologies. The identity politics of the 1960s, which had partly informed Great Society social welfare programs, became a basis for *liberalizing* broadcasting through private cable and satellite technologies and for marketing and *commodifying* identity as a matter of personal lifestyle. The proliferation of new channels also encouraged more refined technologies of consumer choice and self-fashioning, such as the remote control, the time-shifting VCR, and the DVR, all of which made television compatible with lived experiences of individualization and niche-based consumer culture.

While the lifestyle clusters embraced by cable are seemingly infinite – there are now channels for pet owners, military buffs, and even environmentally conscious individuals – niche marketing is governed by the logic of profitability, and this ensures that only those consumer groups with money to spend will be recognized. As John McMurria (2007) argues, cable television was initially pitched as a means of class identification and cultural status. Many of the earliest cable channels for news aficionados, history buffs, the arts, and other culturally legitimated leisure pursuits addressed the professional middle-class “minorities” previously claimed by public broadcasting. As Andrew Goodwin demonstrates in *Dancing in the Distraction Factory: Music Television and Popular Culture* (1992), the mass audience was also fragmented from the outset on the basis of age. Teenagers were encouraged to see MTV as an integral aspect of their unique identities and lifestyle, and to “fight” for their right to consume differently under the marketing slogan “I Want My MTV.” Now a globally successful cultural brand, MTV has been particularly adept at translating Western youth culture into a locally customized cultural resource for lifestyle and identity formation across virtually all parts of the world. Exemplifying the expanded mobility facilitated by the globalization of capitalism, MTV has become a focal point

for scholarly debates over the refinement of cultural imperialism and the possibilities of increasingly “glocal” and hybrid identifications and memberships.

Cable channels aimed at women and people of color have also developed, bringing new promises – and tensions – to the historically charged politics of representation. In “Once in a Lifetime: Constructing ‘The Working Woman’ through Cable Narrowcasting” (1994–1995), Jackie Byars and Eileen Meehan analyze the Lifetime Cable network, launched in 1984 as the first cable channel marketed explicitly to women. Lifetime offered female viewers an opportunity to identify as a distinct cultural collectivity beyond the gendered terrain of daytime soap operas and homemaking programs. The channel addressed women as empowered consumers worthy of their own channel, and in so doing reflected the mainstreaming of liberal feminist discourse. By the 1980s, women had secured some access to the professions, and all women were increasingly expected to be breadwinners for families while also performing a “second shift” of domestic labor at home. In a changing social context, working women were targeted by advertisers not only as consumers of household items but of more expensive goods such as automobiles as well. Lifetime presented the first venue for reaching those upscale, “independent” female television viewers who could afford a cable subscription. The channel built its brand identity around original movies that combined melodrama with socially conscious women’s issues as a way of signaling relevance to this audience. Yet, according to Byars and Meehan, Lifetime equated female empowerment with consumption (including the consumption of Lifetime) and perpetuated ideologies of female subordination to men, and in this sense did more to commercialize and undermine feminism than expand its reach. As Amanda Lotz points out in *Redesigning Women: Television After the Network Era* (2006), more recent cable channels aimed specifically at women – including Oxygen, WE, and the OWN network, headed by Oprah Winfrey – constitute slightly different “brands” of female television, but all maintain the implicitly white, middle-class orientation prioritized by Lifetime, and all equate female empowerment with the consumption of a niche brand. Given cable’s historical connection to the expansion of consumer capitalism, these limitations are not surprising.

Baretta Smith-Shomade’s study *Pimpin Ain’t Easy: Selling Black Entertainment Television* (2008) is a sobering case study of how cable television conceives and markets racial difference within a commercial framework. Focusing on Black Entertainment Television (BET), one of the few cable channels explicitly geared to people of color, Smith-Shomade shows how black entrepreneurs promised to combat network television’s racism and whitewashing. Drawing from the earlier history of Black-owned businesses, executives pitched BET as a means of recognition and empowerment, but relied on limited – and highly stereotypical – constructions of Black identity and culture to attract young audiences. Within the advanced capitalist logic of branding, “blackness” is neither natural nor empowering, she contends. Rather, racial authenticity is commodified and sold back to television viewers as a cultural product to be “consumed” rather than engaged with politically. Other scholars have shown how the “posting” of civil rights activism and legislation has

contributed to this process of racial commodification across proliferating cable channels. In *Kids Rule! Nickelodeon and Consumer Citizenship* (2007), Sarah Banet-Weiser shows how racial difference stripped of any historical or ethnic specificity is incorporated into children's television to mark cable networks such as Nickelodeon as multicultural and cool. Race in this context becomes little more than an identity or "flavor" to be consumed like any other mass customized product. Because Nickelodeon claims to "empower" children (similar to MTV) by constituting a consumer space just for them, pan-ethnic representation is also articulated to new ways of thinking about democracy and citizenship. Consumer citizenship, rather than traditional forms of electoral politics or political organizing, is heralded as the means of inclusion and participation in civic life, for children and other underrepresented groups. As Banet-Weiser shows, this shift speaks to the intensified marketization of social life in advanced capitalist societies, and plays out on television as the equation of brand membership with meaningful forms of representation and "rights."

My own study with James Hay, *Better Living through Reality TV: Television and Post-Welfare Citizenship* (Ouellette & Hay, 2008), focuses on television's relationship to the broader "reinvention" of government in the 1980s and beyond. On one hand, broadcasting was deregulated under the reasoning that the free market is the best way to ensure something called the public interest. Deregulation paved the way for the conglomeration of broadcast and cable networks (many of which are owned by the same parent companies), and it also ushered in a different way of thinking about what television can and should contribute to advanced liberal (or neoliberal) democracy. We show how the logic of consumer empowerment made possible by the expansion of cable overlapped with intensified requirements of self-actualization and self-help as an intensifying requirement of "good" citizenship, as evidenced by the proliferation of broadcast and cable channels offering lifestyle instruction on cooking, financial management, parenting, health and fitness, and similar topics. This development inserts television into the increased marketization of the social, and makes brands of television more integral to a definition of citizenship based more on personal responsibility and self-enterprise than on collective "entitlements" or universal connections to a national welfare state. The reform of Great Society programs and the commercialization of public services is the backdrop against which reality entertainment proliferated on television. While not associated with traditional news or "boring" public interest genres, reality entertainment is often marketed as a civic good, to the extent that it provides "lessons" on proper self-care and strategic self-management in a competitive and privatized social world. Such fare is also attractive to corporate and non-profit "sponsors" seeking to insert themselves into television's articulations of citizenship, volunteerism, and the public good. Significantly, "reality" experiments appear on broadcast channels as well as cable ventures, where they are specifically adapted to specialized demographics and lifestyle clusters.

Mass and niche television are useful to the contemporary reinvention of government. Serialization, we contend, is what makes television suitable to operate as part of a daily regimen of self-actualization, while the lifestyle clustering associated with

cable networks allowed television to become a technology for self-actualization (i.e., for being young, or a woman, or Black). The dramatic increase of makeover television programs that seek to transform the unattractive, the unemployed, the unhealthy, the unsuccessful, and the unruly into self-actualizing and self-regulating citizens speaks to the convergence of television watching, lifestyle clustering, and self-help in the context of neoliberalism. Likewise, the convergence of television with other media, particularly digital technologies such as the web, builds on trends of individualization and self-responsibilization by inserting television into an endless loop of consumer resources for work on the self (Ouellette & Hay, 2008). The point is that television has become less relevant to earlier public interest ideals and more integral to the requirements of managing and improving one's life through a set of cultural resources that can be applied to particular lifestyle problems. Tellingly, we have witnessed a surge of cable networks entirely devoted to popular lifestyle instruction, including the Home and Garden Network, Planet Green, Food Channel, Fit TV, the Learning Channel, and the Do-it-Yourself Network, and cable networks not specifically devoted to lifestyle instruction have also increasingly incorporated "how-to" and instructional elements into their schedules. The call for citizens as well as governments to be more entrepreneurial inflects these intersecting developments with new assumptions about television's relationship to citizenship and democracy.

It is worth noting the uncertainty of public broadcasting in the wake of niche television and new technologies. Across Western capitalist democracies, Georgina Born explains in "Digitising Democracy" (2006, p. 102), the "conditions – technological, economic, political, social and cultural" that once fostered public broadcasting have undergone "such a radical transformation that the concept and practice [...] demand to be reconceived." Born cites the decline of national cultures, increasing individualization, and the flux introduced by digitalization and public sector reform initiatives as factors in the ongoing transformation of European public broadcasting. Interestingly, many European public broadcasters have expanded the definition of public service to include popular reality entertainment focused on lifestyle instruction and makeover formats circulate globally. While the pressures on public broadcasting are also evident in the United States, the situation facing PBS is more complex *vis-à-vis* the British Broadcasting Corporation (BBC) and other national systems. As we have seen, public television arrived late in the United States, as a corrective but structurally marginalized supplement to the commercial model of broadcasting dominant since the 1920s. Created during the expansion of social welfare programs in the 1960s to fill cultural gaps in an over-the-air broadcast schedule dominated by ABC, CBS, and NBC, it has lost much of its footing as the television marketplace has expanded and the broader sociopolitical climate of the United States has changed. The old PBS provided a bridge between the commercial network era of broadcasting and the triumphant declaration of choice, freedom, and empowerment surrounding both the post-television landscape and the concomitant transition to a post-welfare society. Not surprisingly, both the BBC and PBS are now struggling to reinvent themselves as a business, a brand and a resource for a new epoch of mass customization and personal responsibility.

Post-Television?

In *The Television Will be Revolutionized* (2007), Amanda Lotz argues that we are moving into a post-network era, in which the very foundations of television are being transformed by a more flexible mode of production, a changing business model, the decline of the traditional networks, the proliferation of new media technologies, and the further fragmentation of the audience. The surge of reality television, which relies on non-unionized production crews and the unpaid labor of ordinary people, integrates advertising into content, can be produced on short notice, and encourages viewer participation via the web and mobile phones, is a high-profile example of the industrial trends she documents. Of course, as Lotz acknowledges, elements of mass television – including its ritualistic flow into the home – remain fully in place for many people, including those who cannot afford broadband access or cable subscriptions. Moreover, as John Caldwell demonstrates in *Production Culture: Industrial Reflexivity and Critical Practice in Film and Television* (2008), the corporate conglomerates that own the major broadcast networks have developed an arsenal of strategies for ensuring the centrality of television – and television networks – in a context of high anxiety triggered by industrial and technological change. In addition to ratings stunts and intensified flow techniques designed to discourage channel switching, these moves include repurposing content across corporate holdings (such as a broadcast network and cable stations), re-branding campaigns, and promotional activities to educate viewers and affiliates about the “benefits of national network affiliation.”

However much mass television adapts to a changing industrial and technological landscape, the broader logics that have supported narrowcasting have intensified in recent decades. Specialized niche channels aimed at lifestyle clusters continue to proliferate, signaling advancements in consumer choice. What’s more, the emergence of digital viewing platforms such as iTunes and Hulu are presented as flexible and personalized alternatives to the flow established by broadcasters, intensifying the “freedom” and self-actualization associated with VCRs and portable television sets in earlier years. Television has also become integrated into a burgeoning “convergence culture” that encompasses digital games, mobile phones, the web, and film. Many television programs now have offshoots in other old and new media, and interactivity and a general intensity of engagement are the norm for “users” of cross-platform media experiences. Whether the majority of television viewers have adopted these practices is debatable. Still, scholars recognize that change is underway and are scrambling to bring scholarship up to speed, as evidenced by the appearance of anthologies like *Television After TV: Essays on a Medium in Transition* (Spigel & Olsson, 2004) and *Television Studies After TV: Understanding Television in the Post-Broadcast Era* (Turner & Tay, 2009).

While studies of what appears to be the medium’s third conjuncture – *post television* – are incomplete, the tendency so far has been to focus rather narrowly on

technological and industrial change. Raymond Williams once again provides a model for expanding our questions and recognizing the contexts in which the evolution of something called “television” operates.

If mass broadcasting has given way to a more personalized “anywhere, anytime” television experience, this has as much (or more) to do with changing societal conditions as technical mastery. There are models of the contextual approach I am advocating: In *Reality TV: The Work of Being Watched* (2003), Mark Andrejevic situates the transformation of television within broader economic developments. He situates the “promise” of viewer interactivity within the ongoing shift from industrial capitalism to a post-Fordist economy that equates freedom with the ability to “customize” the products of our labor. Andrejevic suggests that the invitation to interact with television using our cell phones and computers is connected to the dispersion and “offloading” of marketing in the new economy. By filling out a survey or joining a forum, we are doing the work of the companies who tabulate information about our preferences and sell them back to us as unique consumer choices. In *Cultural Citizenship: Cosmopolitanism, Consumerism and Television in a Neoliberal Age* (2006), Toby Miller situates the politics of contemporary television within social and political developments, including the decline of industrial jobs, increased militarization, and US foreign policy. For Miller, technological change is less important than television’s enduring relationship to uneven power dynamics, and for this reason he pays little attention to new gizmos like cell phones and tie-in websites. Yet, we could extend his critique to the phenomenon of synergistic media industries partnering with military and corporate sponsors and enlisting consumer involvement in governmental agendas via synergistic broadcast and digital technologies, from websites to computer games.

We need more scholarship that extends Williams’s crucial insights about technology to our current social and technological formations. How does the apparent “posting” of television speak to the politics of gender and leisure, the marketing of difference, the acceleration of branding, or the operationalization of what currently counts as democracy and citizenship? What contradictory capitalist developments, akin to the mobile privatization identified by Williams, might be served or soothed by convergence culture? How is technology shaping and helping to shape the contemporary social forms in which we live? Television scholars need to expand our engagement with the new, and address these issues.

NOTE

- 1 My argument here is indebted to numerous scholars who have identified roughly similar periodizations. In *Authentic™: The Politics of Ambivalence in a Brand Culture* (2012), Sarah Banet-Weiser characterizes the shift from mass, to niche, to digital media and culture as the historical context for the transformation of advertising and the emergence of brand culture in neoliberal times. In her introduction to *Beyond Primetime: Television Programming*

in the *Post-Network Era* (2009), Amanda Lotz locates a similar trajectory within the US television industry, using the terminology “network era,” “multi-channel transition,” and “post-television” to describe historical shifts in the industrial, marketing, and programmatic dimensions of television culture. In *Better Living Through Reality TV: Television and Post-Welfare Citizenship* (Ouellette & Hay, 2008), James Hay and I map this history onto three regulatory periods and the citizenship ideals they emphasize, showing how mass television, niche television, and interactive television intersect with changing political rationalities and strategies of governing.

The Culture Industries

Frederick Wasser

ABSTRACT

The genealogy of the term “culture industry” is traced through Horkheimer and Adorno to Marx. It was coined to describe the relations of production and consumption of media culture in the mid-twentieth century, in an age of mass produced texts consumed by middle-class and working-class audiences. Since the 1980s, there have been two revolutions in the culture industries: a technological revolution, featuring the emergence of digital media, and an audience revolution, featuring fragmentation, participatory formats, and mobility. The result is a post-Fordist system of cultural production and consumption, best exemplified by gaming. The key insights of the “culture industry” argument remain relevant.

Introduction

Culture industries analyses expose to critical view the workings of culture in mass complex societies. The “culture industry” was a term coined by Max Horkheimer and Theodor Adorno (1987). Its subsequent pluralization to culture industries is merely the first indication that this topic has deepened and has multiplied its meanings since the two exiled Germans wrote their essay in the United States, during the last phase of World War II. The marriage of culture and industry into a topic of

critical analysis is overtly Marxist. The topic retains its Marxist overtones even as it has attracted broad interest in the last seven decades. This is because the topic is deliberately holistic – linking economics with other life spheres. Even if Karl Marx believed in the single causal direction of economic relationships determining and fully explaining the cultural expressions of society,¹ there is now a strong tradition of seeing economics and culture as mutually determining. Once culture became industrialized, the contours of everyday lives became visibly structured in these industries. The linkage between the two is elusive, but Horkheimer and Adorno's essay (along with other writings of their intellectual circle such as Siegfried Kracauer [1995], Walter Benjamin [1969], etc.) challenges us to understand how the culture industries operate at the intersection of rationalized production and meaning making.

A primary way to uncover this relationship is to follow it through history. We can divide the production of culture into periods, starting from the traditional pre-industrial phase of "patronage," yielding to the early industrial dominance of entrepreneurs, succeeded by "market professionals" metamorphosing into "corporate professionals." Market professionals seek direct profits from sales of cultural goods, while the corporate professionals, working for large corporations that are often transnational,² work for compensation derived from a combination of direct sales, selling of audiences to advertisers, and even government subsidies, as well as political influence.

In each period there is a mix of motivations for the producing class to support the culture makers. Patronage is relatively easy to understand as an activity motivated by the need of an aristocratic order to visibly display power. That reason continued into the nineteenth century, although this was the period when market professionals learned to make culture in order to make money. The opportunity to make money came about because the middle class now had enough disposable income and leisure to buy art reproductions, print, theater, and subsequently music sheets and movies to yield substantial profits. By the end of that century cultural products such as magazines and newspapers became a medium for advertising. With the advent of broadcasting in the first half of the twentieth century, culture became the driving force in promoting a consumer economy. Broadcasting encouraged the rise of corporate professionals. Advertising-supported culture was actively encouraged by US governments, while European and Asian polities with older patronage traditions were initially skeptical. But even in these countries the culture industries were recruited for political propaganda even if they were not primarily advertising vehicles. The distinction between capitalist advertising and state propaganda was a superficial one for Marxists.

The above periodization is primarily from the point of view of cultural producers. Culture is, also, a relationship between producers and audiences and we can do a parallel history of different periods based on the audience. This perspective has been pioneered by those who wish to describe formations of working-class culture. The founding father is E. P. Thompson (1966, 1967) with his seminal works on class and labor discipline. While his writings take the long view starting with the feudal age,

and are not particularly oriented to the age of the culture industries, there are histories focusing on recent evolutions of mass audiences.

For example, we can look at the audience histories that Richard Butsch has written from a media studies perspective. He begins his history of the US audience at the dawn of the mass media age in the 1830s (Butsch, 2000). These audiences became socially visible phenomena in the United States in various theater districts in New York, Philadelphia, and other emerging cities. They were mostly male and of mixed classes (the only women present in the audiences were presumed to be “working”). The theater was very active, as audience members shouted out their responses to the show and to each other, continuing the traditions of “conversations across the footlights.” For example, it was customary for the audience to demand that favorite sections of the show (typically a fairly eclectic mix of songs, sketches, and even Shakespeare) be repeated even before the play had ended. After the Civil War there was increasing middle-class affluence and a concurrent domestication of the audience for legitimate theater. People now were expected to be silent during the performance. The “civilized” middle class were now imposing a sense of decorum and deferred gratification upon the working class in the theater. This sense of restraint was extended to vaudeville and the music hall. This transition is a visible trace of the changing class relationships at this time.

The early movie theaters replicated this evolution from rowdy audiences to quiet passive ones. This paralleled and was controlled by film producers as they shifted their productions from short films of various attractions to long-form narratives and even further as synchronized sound films became the industry standard after 1927. Roy Rosenzweig (1983) adds a more explicit note to the taming effect of mass media. His study of the working class in Worcester, Massachusetts at the turn of the twentieth century demonstrates that the early movie theaters competed with and eroded the saloon culture that had been working men’s primary leisure activity. Film is an early example of a mass entertainment medium that initially fits in with everyday life and then changes it. We can find similar patterns in newspapers, magazines, and broadcasting.

Beyond Passive and Active to a Revolutionary Paradigm Shift

These and other studies set up the perennial concern of culture industry analysts to evaluate the *passive* versus the *active* role of the people. In the twentieth century, mass media became the dominant form of cultural transmission, which led to renewed concerns about the capacity for the culture industries to indoctrinate passive audiences. Advertisers were willing to spend huge amounts of money to take advantage of the audience’s presumed passive reception and media critics were willing to assume advertisers were right. The 1950s were the historical moment when many

mandarins bemoaned the audience's passive reception of media. Horkheimer and Adorno's critique was the most radical lament. It was inspired by Max Weber's thesis that Enlightenment reason was not leading to greater emancipation but toward an instrumentalization of human life. Horkheimer and Adorno easily traced how the industrialization of US popular culture had the function of reconciling people to their "iron cages" of rational bureaucratic existence. Adorno would go on in the final phase of his career to explore the difference between authentic art with its possibility of emancipation and the industrialized pastiche of art that eliminated this possibility.

The Horkheimer/Adorno thesis came out of a direct examination of the culture industry's products and ignored the actual response of people to those products. Another way of understanding the culture industry's audiences emerged rather slowly, throughout the 1960s. This approach, promoted by functionalists, did look at actual responses and emphasized the ability of the audience to reinterpret media messages in order to resist passive acceptance of intended messages. This emphasis on *active* audience reinterpretation was used by academics identified with the uses and gratifications approach and with British cultural studies.

As these studies gained in influence, some challenged whether such autonomous audience meaning making changed industrial practices. Executives in the culture industries continued to produce and distribute as if they believed audiences were relatively passive recipients of media content. Advertising increased in its support of television, radio, and print throughout the 1980s. Other culture industries supported by direct consumer spending, such as film and recorded music, had flirted with business models based on alternative audiences in the 1950s and 1960s (for example, independent "exploitation" productions combined with US imports of European art films, and in music the quest for a "counterculture" market). Briefly it seemed that a dichotomy had been set up between advertising supporting mass passive audience cultures in contrast to direct purchase business models constructing niched active audiences. But then in the 1970s and 1980s film and music lapsed back into oligopolistic organization with top-down production and distribution practices. There was a renewed presumption of passive mainstream audiences in every business plan of all the culture industries.

Since the 1980s there has been a profound upheaval that can be visibly measured but still resists understanding. Two revolutions have occurred. The more accepted one is the *Technological Revolution*. This refers to the proliferation of new media and, in particular, to digital technology supplanting previous recording methods in the production, distribution, and exhibition of culture. The other is the *Audience Revolution*. This revolution is the fragmentation of the formerly massed broadcast audience and the general rise in participatory and experiential content for audiences, ranging from the explosive growth in computer and video gaming to the rise in long-form "quality" TV shows that demand more involvement, such as *Lost* (ABC, 2004–2010).

This revolution in particular and both revolutions together suggest that an active audience has finally overtly changed the industries. The most recent and perhaps

conclusive trend has been toward increased direct consumer spending on media products. An eye-opening quote from a prominent communication investment research report (a genre that usually favors sober trend-spotting) supports the epochal change: "In a related trend that indicates a seminal shift in audience from ad-supported to consumer-controlled media, time spent with consumer-supported media surpassed ad-supported in 2008 for the first time, a culmination of two decades of secular shift" (Veronis Suhler Stevenson, 2009, 2) The change is driven by the rise in the category of subscription TV, which includes not only cable but also set-top, DVR, and other computer-driven subscriptions. This category only measured 6% of US end-user spending on media in 1976, while in 2008 it hovered around 45%. There has been a less dramatic increase in spending on the combination of home video (DVD and VCR) and film box office, alongside severe decreases in spending on recorded music and newspapers.

Raymond Williams's (1974) critique of Marshall McLuhan's technological determinism helps frame the relationship between the technological and audience revolutions. This is because Williams constructs a model of mutual determination between culture and technology by describing a structure of feeling he calls "mobile privatization." Williams sees its forerunner in the domestic plays of Henrik Ibsen and Anton Chekhov. More to the point, at the time of his writing, Williams was understanding the living room radio and television as primary technologies of privatization. Transistor radios and the Walkman made these technologies mobile even in the analogue age, before the digital breakthrough. Subsequent to Williams's lifetime, mobile privatization has been accelerated by wired products such as Personal Digital Assistants (PDAs) and the iPod. In the 1990s the entire technology of media communications was transformed to add Internet connectiveness to Williams's original description of mobile privatization. His ability to be so prescient in 1977 was not based on his intimate knowledge of emerging personal computing, but his ability to describe preexisting cultural patterns. These patterns shaped the uses to which digital technology would be applied.

For example, social networking has very recently become a phenomenon that is the latest embodiment of mobile privatization. This describes electronic sites that allow Internet users to create communities of "friends" who can share text messages, images, and sounds. Platforms for these sites have been shifting rapidly, such as the sudden rise in 2006 of MySpace, which suffered an equally precipitous fall when Facebook and Twitter became ubiquitous two years later. They were created by small companies and yet have attracted the interest of political parties and large industries interested in the ability of social networks to bring together audiences and citizenries. Some actions have been premature, such as News Corporation's 2005 purchase of MySpace, while others have still to mature, such as Microsoft's partnership with Facebook. What can already be concluded is that these electronic spaces will play pivotal roles in the future age of cultural convergence across media and across geographical boundaries. Viral marketing is the electronic version of the old fashioned word of mouth and already has been used to support TV shows, movies, and various

music products. The culture industries are responding to the twin revolutions in a constantly evolving outflanking maneuver. This results in a dialectical logic, as when people use technological revolutions to create new communities which in turn are made into audiences by culture industries using the conglomerating strategy to contain the new technologies.

This is a paradigm shift and creates exciting times in the analysis of culture industries. Something is happening. Because people are spending more directly on media, analysts hypothesize that people are using media in new ways in their culture. Shifts in revenue streams take advantage of both the Audience and Technological Revolutions. The earlier frames of market versus corporate producers and passive versus active audiences obscure the complexities of the twenty-first century, where there has been fragmentation and consolidation, engagement and docility, and the interpenetration of work and leisure time.³ Market triumph has been followed by the general market collapse of the last few years, while the horizontally integrated media conglomerates seem relatively secure. Digital technology has increased opportunities for do-it-yourself production and distribution (DIY), although to be sure the available products continue to be dominated by the output of a few big corporations. On the audience side, the activities of consuming, playing, and otherwise interacting can be judged as active or passive or as a hybrid. The only clear conclusion is that previous categories have become blurred.

Therefore, analysis of the culture industries needs to take a new look at the relationship between post-Fordist blends of work and leisure and the structures of the culture industries themselves. I therefore have sequenced the rest of this chapter as follows:

- Democratic diversity and industrial formations.
- Convergence and fragmentation of media forms.
- The active audience as cultural reflections of the shift to post-Fordist labor practices.

Democratic Diversity and Industrial Formations

“Authenticity” inspired the original cultural theorists to look at cultural industrialization. This is still operative although contemporary industry analysts tend to shy away from such an interpretative category. Instead, many are motivated to examine the culture industries to see if these industries can provide the necessary diversity for democracies. This is certainly a vital goal in the mass representative democracies that have become the model for many nation-states. The diversity-of-voices concern was raised by James Madison in the earliest moments of the United States when the country was both rural and fragmented, and was an inspiration for the freedom of speech clause in the first amendment of the US Constitution. However, the US

experience has not proven that mere freedom of speech will safeguard the ability of diverse views to reach everyone. Therefore, several other countries have mandated that broadcast industries provide diverse content. These results have also been questionable for true Madisonian diversity and many US citizens view such mandates as subverting freedom of speech.

Instead, early twentieth-century US citizens relied on various antitrust laws to break up culture industry monopolies. These laws were designed more to safeguard economic competition and development and less to ensure a democratic plurality of voices in mass media, and plurality remained an elusive goal. As a consequence, in the final third of the last century, the government largely abandoned applying anti-trust laws to media, accepting the argument that the proliferation of new media has guaranteed a diversity of voices. New media have provided better outlets for suppressed voices in some countries. Yet their effectiveness is questioned and in older democracies they have not reinvigorated a public sphere of debate. The charge is that cable TV and other dominant media have led to substituting the theatrics of political debate for the actual benefits of diversity. There continues to be the perennial investigation of whether communication industries are actually serving the needs of democracy (Herman & Chomsky, 1988). Such an investigation combines issues of globalization and the growth of the culture industries.

Globalization and Media Conglomerates

The continuing trend of technological improvements since the earliest forms of mechanical reproduction has been a globalization of culture. This was first noticed with the 1920s export of Hollywood films, and has of course only accelerated with the latest technological innovations. In the very first instance, right-wing political leaders worried about the international spread of democratic ideals subverting traditional loyalties to the state. Subsequent to World War II, left wingers theorized that the globalization of culture, dominated by US film and information exports, was leading to media imperialism and the spread of neoliberal market values. This model fell somewhat out of favor by the late 1980s since after the initial dominance of US exports there has been a growth in the export of television products from other countries. In addition some scholars have argued that audiences read cultural content in ways that thwart the dominant ideologies and that this is especially true in the reception of foreign cultural products (Liebes & Katz, 1993).

However, there is an acknowledged correlation between the rise of global media conglomerates and the ideology of neoliberal economics (Carey, 1999). Global media conglomerates now dominate the culture industries and their very premise of operation seems to defy national regulation of cultural marketplaces. Many conglomerates hire pundits to explain marketplace wisdom and to denounce government regulations, while these same firms benefit from the erosion of a single nation's

ability to limit their activities and size. Therefore critical concern finds that it is a seamless effort to go from analyzing global monoculturalism to examining cross-media domination (Miller, Govil, McMurrin, Maxwell, & Wang, 2005; Wasko, 1995). The rise of new (predominantly digital) media has enhanced opportunities for cross-media marketing, which threatens diversity by recycling the same content across film, television, video games, and more. The new media of cable and home video inspired a particularly relentless consolidation of media industries across media in the mid-1980s. This oligopoly was already in place when digital methods of distribution started appearing in the 1990s and was able to maintain its control of DVD technology, but seems less certain as to what to do in the age of Internet downloads. The news industry has been upended and the music industry has been changed by such downloads, while the film and television industries are still experimenting with the Internet.

A brief summation of the historical transition from vertical integration to horizontal integration will aid understanding of the current pattern of market control. In the first half of the twentieth century, Hollywood and broadcasting pursued a classic model of vertical integration. This is when a culture industry company creates divisions that handle production, distribution, and exhibition within just one medium. The classic factory model of Hollywood studios was to produce films, distribute them, and own many of the theaters in which these films were shown. Even as this system developed the government used antitrust laws to break it up. This culminated in the Paramount consent decree of 1948 that forced Hollywood studios to divest their theaters. In broadcasting, networks tried to produce and distribute shows and own as many stations as possible. The federal regulator pushed back by imposing limits on the number of stations one broadcasting network could own (encoded in a variety of laws going as far back as the Communications Act of 1934 and continuing in a much weaker fashion after Congress passed a law limiting ownership to 39% of the national audience in 2004) and with the finance-syndication rules that separated television production from television distribution and was enforced by the Federal Communications Commission from 1971 until 1995.

The strategy to dominate shifted in the 1980s. Culture industry companies became very interested in horizontal integration. This is when one company owns divisions in several different media such as film, broadcast television, cable television, and more. Nowadays a media company is not worth its salt unless it owns major divisions in at least half a dozen media. There had always been some attempts to do this, such as in the 1920s when US newspapers moved into radio, radio moved into film and recorded music, etc. In other countries with smaller audiences than the United States there had been horizontal integration on a national scale, such as between television and film production in many European countries. Then in the 1980s in the United States there was accelerated pursuit of horizontal integration to create truly “transnational” media companies. In addition, News Corporation – an Australian company – became a nominal US company in order to solidify its transnational status. Sony is the biggest non-US media corporation, although its Japanese orientation has dramatically eroded since the appointment of Howard Stringer as its CEO.

What follows is a brief history of the contemporary wave of media conglomerate building. The strongest precedent was Walt Disney's visionary use of film and television to promote theme parks and merchandise in the suburban age. His innovations in the 1950s remained somewhat dormant until the cable and video revolution. Ted Turner is the 1980s business executive of the same visionary caliber as Walt Disney in his ability to respond to new media technologies with new business plans. He had already married broadcast, cable, and satellite technologies to kick-start the Turner Broadcasting System (organized from previous companies in 1979). He understood the need to sustain a media conglomerate with a deep library of material and so bought the famous film studio MGM in 1986. Although he was unable to finance the purchase and had to resell it within two years, his action began the wave of culture industry consolidation in response to new technologies. A year previously, News Corporation had taken over Twentieth Century Fox. This seemed merely opportunistic until News Corporation created Fox Broadcasting a year later, amplifying Turner's strategy to use various media platforms to aggressively sell content. Fox was the first new US television network to emerge and survive since the demise of Dumont three decades previously.

In 1985–1986, all three traditional US broadcasting networks switched ownership. One of the new owners, General Electric (which bought NBC) was an example of an electronic company buying an entertainment distributor. An international event in this trend was the Japanese manufacturer Sony buying Columbia Records in 1988 and then acquiring Columbia Pictures in 1989. Matsushita tried a similar strategy of merging hardware and content divisions when it bought MCA/Universal in 1991. Unlike Sony it gave up on this strategy and sold Universal in 1995. Ultimately General Electric acquired Universal to form NBC–Universal in 2004. In January 2011 General Electric sold 51% of NBC–Universal to the cable operator Comcast.

Other noteworthy expansions occurred when Warner Communications merged with the publishing and cable giant Time-Life in 1989 to form Time–Warner. It acquired Turner Broadcasting in 1995. The 1993 takeover of Paramount film studios by Viacom (previously a television distributor) was significantly financed by the video store chain Blockbuster. The Walt Disney Company had been building itself up internally until it went on an acquisition spree with the purchase of the boutique movie distributor Miramax in 1993 and then buying the mammoth TV network ABC in 1995 (ABC brought many major cable networks into the Disney group). Viacom went on to acquire the CBS network in a 1999 stock swap. The trend continued with the 2000 purchase of Time–Warner by America Online (AOL).

This last-mentioned purchase was the crest of the wave. Time–Warner spun off AOL in 2009. At this point we can generalize that major film, music, and network and cable television operations have been merged by and large into big media companies: Walt Disney Company, Time–Warner, Viacom, News Corporation, Sony, and Comcast. This trend is paralleled in Europe and Latin America with such major media companies as Vivendi (primarily French), Bertelsmann (primarily German), Organizações Globo (primarily Brazilian), and Televisa (primarily Mexican). There

are a few emerging culture industries where distributors remain autonomous (electronic games and e-commerce), but horizontal integration is dominant.

Deregulation and Neoliberalism

This wave of building media conglomerates occurred in a very favorable political environment in the United States and, subsequently, in Europe and Asia. As the economic boom of the immediate postwar period, cultivated by a mix of private and public planning and often financed by governments, became self-sustaining, a political philosophy of neoliberalism gained credence in industrialized countries. This philosophy held that markets were creative and self-correcting to a much greater extent than public regulations and government actions. As neoliberal politicians gained power, they implemented this philosophy with policies that were labeled *deregulation*. In the United States, this consisted of lifting laws and policies that had placed limits on ownership and business practices, culminating in the Telecommunications Act of 1996. In Europe and Asia this neoliberalism was expressed by allowing private investors to create commercial alternatives to public broadcasting monopolies.

Neoliberal policy tries to enhance competition between media companies by loosening various rules. The result has been debated. A relatively unanticipated and ironic result occurred in US radio when Clear Channel, a billboard advertising company located in San Antonio, Texas, went on a spending spree so that at one point it owned almost 25% of radio stations. The company continues to monopolize radio with detrimental results for public uses of broadcasting (Klinenberg, 2007).

Political Timidity, Rudeness, and Partisanship

Thus deregulation – which supposedly got the government out of the media business – inspired media conglomerates to return the favor by promoting political agendas, particularly those of the government. For instance, Clear Channel became notorious for orchestrating a campaign against musicians who opposed the US government's war policy in 2003. In general, deregulated media conglomerates give their governments' viewpoints as often as public broadcasters. Although in the UK it was the publicly owned British Broadcasting Corporation (BBC) that expressed skepticism about government statements concerning the Iraqi threat, it paid the price when the British government used the 2003 Hutton inquiry to force the BBC into a more submissive tone, which continues to prevail. Whenever the British government favors commercial competition with the BBC, it has the overtone of intimidating political coverage. Recently it has been revealed that British politicians sought favorable treatment from the commercial News Corporation to scandalous degrees, as deregulation allowed the

company to gain bigger parts of the British audience. In Italy, Silvio Berlusconi took advantage of deregulation to build up Mediaset as a broadcasting rival to public system RAI. After he used his resulting influence to become prime minister, critics charged that he was not at all reluctant to use both Mediaset and RAI to control the political agenda. Thus deregulation historically (despite neoliberal claims) does not foster media independence from politics as much as it engenders political favoritism.

In the era of horizontal integration such political concerns spill over from news operations onto entertainment divisions. US examples abound in the tense situation of the Iraq invasion: Viacom allowed pro-government pressure groups to force it to delete a biopic of Ronald Reagan from its CBS schedule. The Walt Disney Company decided not to distribute *Fahrenheit 9/11*. Time–Warner refused to release David O. Russell’s documentary on the first Gulf War.⁴ In all these cases, media conglomerates had already financed production. It was fairly obvious that horizontally integrated companies feared retribution from the government against their far-flung enterprises.

These kinds of incidents are in keeping with the expectation that as entertainment companies acquired broadcasting networks, they would also acquire the traditional broadcaster’s political timidity. Networks had historically achieved this by maintaining “objective” coverage of news and avoiding controversies in entertainment. The technological revolution has subverted this “objective” consensus. The clearest example is News Corporation extending the overt right-wing “populism” of its British and US newspapers into its cable (and to a lesser extent broadcasting) news operations in the United States. Its overt partisanship is not timid consensus but brazen narrowcasting. This turn toward broadcast partisanship can be traced back to post-television radio, which was losing its broad audience. Talk radio started in the 1960s and hosts and callers turned increasingly to partisan political topics until its political force became noticeable in the 1980s and 1990s.

Fox and other cable programmers learned from talk radio to reach profitable niche audiences with tabloid news shows such as *A Current Affair* (WNYW, 1986–1996) and *Hard Copy* (Paramount Television, 1989–1999). Specifically, when News Corporation moved into US television with its 1986 creation of Fox TV, its CEO, Rupert Murdoch, decided that the new network would compete with the established three networks by pursuing a niche audience rather than the entire audience. Their entertainment programming featured dysfunctional protagonists and rude dialogue. This was noticeable in their two influential hits, *Married with Children* (Fox, 1987–1997) and *The Simpsons* (Fox, 1989–current). This rudeness became a general feature of Fox programming. Talk radio already linked rudeness and partisan politics. Cable pundits were increasingly using this formula when News Corporation launched the Fox News Channel (FNC) in 1996. FNC gave its news and opinion shows a shrill right-wing slant. While this strategy carried favor with politicians (mostly Republicans), a deeper motivation is to pursue profitable angry conservative audience segments even at the risk of alienating other significant parts of the broad mainstream. Media vulgarity is a global trend. It fragments the audience and has been linked to a general trend against consensus building in contemporary democracies.⁵

The Active Audience as Cultural Reflection of the Shift to Post-Fordist Labor Practices

From the perspective of the audience revolution, partisanship and fragmentation are part of a general cultural drive. They appeal to “activated” audiences, which are somewhat distinct from active audiences. This inspires culture industries research into the shifting balance between work and leisure. When Adorno and Horkheimer wrote their essay, labor and therefore leisure were organized according to the Fordist model. This presumed first and foremost that home and the workplace were two separate locations and that labor time was quite different than leisure time. The Fordist model was named after Henry Ford and the practices he used in creating his huge automobile company. His company had broken down the work process into simple and efficient steps, which is known as Taylorism.⁶ Taylorism also included the idea that work time and output were quite predictable. After a long fight with organized labor the typical work shift was reduced to eight hours (optimally from 9 a.m. till 5 p.m.). The Fordist model presupposed that most work was associated with manufacturing, the prevalence of high manufacturing wages, the decline in the number of people working two jobs, and that only one parent in a family would actually go to work. This also led to predictable leisure habits. Therefore, culture industries could produce and market mass audiences to advertisers (Smythe, 1994).

However, these things have declined to the point where we now speak of a “post-Fordist” era of work. The great changes already underway in the United States in the 1960s became globally apparent by the 1970s and therefore roughly anticipate the revolutions in the culture industries. The three most measurable changes were the return of women to salaried work after their departure from such jobs in the immediate aftermath of World War II; the shift of work in advanced countries from manufacturing to service (in the broad sense of the word) industries; and increasing affluence due to a variety of factors. In some countries wages continued to rise even through the 1990s. The US experience was that real wages did not increase much after the 1970s, but the increase in the number of people working in two- and multiple-income families, together with lower costs of borrowing and lower taxes, also led to the spread of affluent lifestyles. US families led the global consumerist expansion of the final decades of the twentieth century. This rise in post-Fordist labor and middle-class lifestyles was duplicated elsewhere.

Thus we have three trends to consider: the expansion of the work sphere (including women); the shift of work from the well-defined time and space of manufacturing to the relatively more fluid requirements of service (which often involves at-home preparation and shifting time commitments to meet clients’ needs); and the spread of middle-class values and consumerist aspirations.

Technologies are successful in as far as they fit into or facilitate these trends. Quite often technologies blur the boundaries between work and leisure as developers seek to streamline work. Post-Fordist labor valorizes the concept of multi-tasking and

flexible scheduling. This is exemplified by the personal computer (PC), which does many things at once for a single user. In the 1950s and 1960s, individual visionaries such as Vannevar Bush, J. C. R. Licklider, and Douglas Engelbart foresaw and pushed the hybridity of the computer. The switch to a graphic user interface and the development of the mouse eventually made the personal computer a medium of multiple human sign systems, ranging from music to pictures to photographs to text. This therefore encourages the multiple functions of work, entertainment, and information gathering.

Even before the PC was widespread, post-Fordist labor practices were pressuring the temporal schedule of everyday life. The nine-to-five schedule had become a fossil in the service economy. These pressures explain the adoption of pre-digital media technologies that allowed flexible cultural distribution. Not everyone can be home at 8:30 p.m. to watch *The Cosby Show* (NBC, 1984–1992). However, technologies that had facilitated flexible work time could also deliver flexible leisure. An early example of this culture industrial strategy was the marketing of Sony's VCR – Betamax – for the purpose of *time-shifting*: recording TV programs at home, to view later. The VCR became the phenomenal media success story of the mid-1970s.

As more people bought the VCR to record TV shows in order to watch at more convenient times, they improvised other uses of the VCR. Exchanges of pornographic video cassettes developed into the video rental market.⁷ At this point people were using the VCR to rent mainstream movies and this in turn inspired the development of multiplex movie theaters, which also allowed people greater control of when to see a movie. The dialectic continued as the culture industries moved from the cassette to the DVD in 1996. Time-shifting could largely be accomplished through digital apparatuses (DVRs) and flexible programming, while the enhanced capacity of digital storage devices offered additional features, giving viewers the feeling of more participation.

The PC first reached a mass market because of spreadsheet programs and other time-saving devices. In turn its popularity supported the revitalization of computer games, which in turn supported the universal adoption of color monitors and audio-visual software. At the same time the growth of electronic mail and the Internet reached enough of a mass to motivate dramatically increased adoption of PC use for communication and for telecommuting and other forms of working at home. Email and Internet usage blurred the distinction between work and leisure. Eventually, the PC emerged as a primary training tool for work, but since it is located in the home, such training takes the form of entertainment. This is most apparent in gaming. A study conducted at Harvard Business School established that online gamers develop the ability to interact with strangers via their computers and that this leads to unique work skills for the contemporary work space (Beck & Wade, 2004).

Digital computing has affected the production, distribution, and reception of culture. But its ability to do many things at once often conflates and confuses analysis of the audience revolution.

The culture industries became adept at offering consumers a dialectic between a culture of convenience and a culture of involvement and participation. Involvement and participation are not a response to work pressures on time usage but a reaction to another type of post-Fordist work pressure. The shift to service jobs changes the general social psychology of the worker. These jobs are premised on working well with clients, therefore motivating a rise in “emotional labor,” a term used by Hochschild (1983) to describe the increasing demand on workers to control and use their emotions in order to give value to the client. This is a new work discipline constraint that motivates the desire for compensatory leisure practices. In other words there is an intuitive connection between the rise in emotional labor and the audiences’ desire for mass media simulations of new experiences and engaged emotions. People now pursue experience by playing games and buying DVDs with added features, paying additional sums to watch 3D movies, “quality” television, and more.

The growth of video games is the most dramatic development in the culture of pursuing experience. US consumer spending on video games topped \$64 billion in 2004, accounting for approximately 8% of total media spending (Veronis Suhler Stevenson). There are comparable statistics in most affluent nations. Its growth is a counter-trend to time-shifting and multi-tasking since video games in all forms (console, computer, online, and arcade) squander time, at least from the work ethos perspective of late capitalism. The greatest attention grabbers are games such as *Grand Theft Auto*, which takes a minimum of ten hours to play through. These games are evidence that post-Fordist labor has changed what mass culture audiences want – from passive acceptance of linear narratives to active participation in simulations of experience.

Active engagement and time control explains the shift from advertiser-supported media to media directly paid for by the audience. Audiences are motivated to buy a console game or take out a subscription to premium cable rather than just accept the sitcom that a broadcast network is offering on “free” television.⁸ They will spend billions of dollars not only on the software and hardware of gaming but also for the virtual assets of online gaming (Dyer-Witheford & de Peuter, 2009, Ch. 5).

Return to Industry

The culture industries are continually both shaping and adapting to everyday life. The circumstances of post-Fordist labor have motivated people to pay more for culture than previously. The global populace now pays more directly for mass media even while consuming as much advertising as before.⁹ Traditionally, the culture industries relied heavily on one payment method per industry, both direct and indirect. Indirect payment is defined by payment from sources other than the audience, such as advertisers (including corporate sponsors), governments (subsidies and grants; collection of obligatory license fees), and donations from patrons (a re-feudalization of culture?).

Direct payment includes those who pay per view (PPV), those who pay per product (direct purchase of records, DVDs, etc.), and those who pay by subscription (typical of Internet, cable, and satellite users). Of course, individuals are also responsible for indirect payments either through taxes or increased prices on advertised consumer goods.

Now, every corporation seeks multiple payment methods. For example, public broadcasters in most nations accept advertising, while commercial Internet providers and cablecasters charge for both subscriptions and advertisements. The increases are most prominent in visual media such as films and television. The very latest manifestation of this is that studios obtain increased payment for 3D movies as well as for Internet delivery of films and television shows. The audio (radio and music) and print industries have also been experimenting in seeking multiple revenue streams from the Internet and satellites.

The conglomerate structure of most entertainment industries has allowed them to weather the volatility of new delivery systems. Internet file sharing around the world has been an unprecedented challenge for the culture industries. The companies have not been complacent. They have obtained government protection in monitoring and shutting down file sharing and other computing threats. On the positive side media companies are constantly experimenting with strategies to capture the profitable potential of Internet marketing and distribution.¹⁰ Meanwhile, cultural labor has had to struggle to get these companies to share their new Internet revenues. In general, digital technology has not been friendly to organized labor; most notably, video game labor has had a hard time organizing.

While things are still in flux, the corporate power of the culture industries has not diminished, which brings us back to the issues of authenticity and diversity. For both of these reasons many hope that the radical potential of digital production and distribution may still emerge. The concept of “long tail” marketing is one of the more recent influential concepts inspiring this hope. This model states that without the physical bottlenecks of limited shelf space, Internet distributors can offer vastly expanded inventory and that consumers are responding by buying more low-volume niche items instead of blockbuster top-ten items (Anderson, 2006). More filmmakers are exploring self-distribution, just as more of their compatriots are exploring self-distribution in music and fiction publishing. To date few careers or new companies have actually been sustained by self-distribution and micro sales, but no one can deny the potential for grassroots cultural production to be an entry point for new cultural producers (for a particularly hopeful analysis of film, see Tryon, 2009). For now we must explain the continuation of existing patterns of power in the culture industries and can only wait on whether digital distributions will upset these patterns.

The analysis as well as the state of the culture industries are much more in flux than when Adorno and Horkheimer wrote. We are in the middle of parallel technological revolutions – an audience revolution and the transformation of basic divisions of labor and leisure.

NOTES

- 1 Raymond Williams (2010) has shown that both Karl Marx and Friedrich Engels were not as mono-deterministic as many have assumed.
- 2 I like the distinction between global or international companies and transnational ones. The former are traditional national companies who happen to do much if not most of their business in foreign countries. In contrast, transnational companies have a less certain allegiance to one country since internal power and assets are distributed in many different centers.
- 3 An exciting fresh approach to the interpenetration of leisure and work is provided by Roberto Igarza (2009), the title of whose book translates as “Bubbles of Leisure: New Forms of Consumer Culture.”
- 4 Time–Warner had only a minor role as a broadcasting network since its only terrestrial network at the time was the relatively small Warner Bros. Nonetheless its overall size, its importance as a producer for other US networks, and its extensive cable operations easily account for the company’s sensitivity to political pressures.
- 5 There have been some historical media offerings in which everyone participated and which took on the nature of “media events.” Dayan and Katz (1992) explain that these were often broadcasts of nation-building rituals such as funerals, sports, and state visits by important leaders. Participation consisted of audiences actively suspending normal behavior in order to witness these broadcasts. More recently, Katz and Liebes (2007) have noticed the post-1980s relative demise of such media events and link the demise to audience fragmentation.
- 6 Frederick Taylor (1856–1915) had used time and motion studies to simplify work and management in various industries. His techniques were adopted worldwide.
- 7 There was a format competition between Betamax and Matsushita’s VHS at the time. They could have coexisted if people had continued to buy the VCR for time-shifting. However, when they started to buy VCRs in order to rent videos and distributors resisted carrying two different tape formats for rented videos, VHS had too much “external” advantage and Sony withdrew Betamax from the consumer market.
- 8 In the US context, “free” broadcasting refers to broadcasting that is paid for by advertising rather than by the consumer directly. Even in these cases the consumer has spent the money it takes to buy the equipment for such “free” content.
- 9 In the nineteenth century, newspaper publisher Charles Scripps observed that people invariably spend the same amount of their disposable income on mass media. Scholars have measured this hunch and found that it was roughly true from the turn of the last century until the 1970s. Since then, media spending as a percentage of disposable income has been rising significantly.
- 10 Brian Winston (1996) has theorized that corporate suppression of the radical potential of new technologies is practically a historical constant.

Advertising and Consumer Culture

A Historical Review

Inger L. Stole

ABSTRACT

This chapter argues that the proliferation of advertising has been key to the creation and expansion of a modern consumer society. It explores literature on the growth of advertising with an emphasis on developments in the early part of the twentieth century. Using an institutional approach, it discusses the impact of advertising on discourses surrounding the emerging culture of consumption. Throughout the twentieth century, advertising and the consumer society it commanded were challenged, testing the political powers of marketing forces and their supporting institutions in both the cultural and political arenas. Commercial forces won most of these battles but were unable to eliminate a general uneasiness with commercialization.

Introduction

Since the late nineteenth century, consumer culture has become a defining element of what the United States embodies. Central to this development has been the rise of national advertising. Since the end of the Civil War, advertising has morphed from relative obscurity into a \$280 billion industry leaving few of our social, political, cultural, and even educational institutions unaffected.¹

During the past few decades, advertising and consumer issues have attracted an increased amount of scholarly interest, giving impetus to an interdisciplinary and rapidly expanding field of academic study. The task of capturing the complete history is complex, demanding a wide range of methodological and conceptual frameworks and approaches.

This chapter employs an institutional approach, locating the proliferation of advertising as the key component in the creation and expansion of a modern consumer society. Drawing upon published works in the field, I explore the growth of advertising with an emphasis on developments in the early part of the twentieth century, and discuss their impact on discourses surrounding the culture of consumption that emerged in tandem. This did not mean that these developments were automatically accepted. Throughout the twentieth century, advertising and the consumer society it commanded were challenged, even condemned, testing the political powers of marketing forces and their supporting institutions. Although commercial forces won most of these battles, a general uneasiness continued to linger throughout the twentieth century and occasionally flared up, although always in new ways that reflected the ongoing changes caused by commercialization.²

This chapter delineates how, periodically throughout the twentieth century, organized consumer complaints would emerge, leaving commercial forces in search of political defense. The first organized consumer protest emerged during the Progressive era when activists decried deplorable industry practices and pressed for legislative reform. The second occurred in response to the proliferation of advertising after World War I when a feisty 1930s consumer movement demanded corporate accountability and more reliable information about products. The 1960s witnessed the rise of yet another consumer movement. This time, advocates demanded better consumer protection laws, increased product safety, and increased government oversight of corporate conduct. I end my essay with a brief description of the fourth wave of consumer activism that emerged toward the end of the twentieth century. It encompassed concerns and unsolved issues from each of the three previous consumer movements but this time in a global context.

The Rise of National Advertising and a Modern Consumer Culture

Technological innovations combined with a massive influx of immigrant workers to the United States' burgeoning industrial centers contributed to a record production of goods in the years immediately following the Civil War. Companies grew larger, often dominating their field and producing far beyond what their local markets could absorb. Limited outlets hampered the distribution of goods and this, in turn, threatened capital investment in machinery, labor, and products. Recognizing the need to seek larger markets, manufacturers turned to national advertising.

Advertising must be understood, first and foremost, as a business expense. But this is far from sufficient; the United States has had a private-enterprise economy throughout its history but national advertising emerged as a dominant institution only in the twentieth century. Advertising was in use before, of course, but most ads were akin to what today is called classified advertising, that is, dry factual reports informing customers about products and their availability. A merchant might place a notice in the local paper informing customers about a new shipment of lace, calico, or French milled soaps, for example. Following the Civil War, advertising began its climb to prominence. (For a discussion of advertising's role in creating national markets, see Pope, 1983, Ch. 2; Strasser, 1989; Tedlow, 1990.) By the early 1900s firms such as the California Fruit Canners Association, Royal Baking Powder, National Biscuits, and National Candy dominated 40–70% of their individual industries, while American Can, Du Pont, and Eastman Kodak controlled over 70% of the markets in their categories (Lamoreaux, 1985, p. 3).

As industries became more concentrated, often with one firm dominating more than half of the output, it became increasingly difficult for new actors to enter the market. Each of the large firms in what is commonly referred to as oligopolistic markets was large enough to survive a price war. But to engage in price competition would only reduce the total revenue going into a given industry. Thus, they gravitated toward a pricing structure that maximized the total revenue going into the industry. Understood this way, advertising becomes a mandatory business expense for all firms in an oligopolistic market to protect their market shares from attack. To large corporations advertising represents a competitive weapon superior to cutthroat price competition in the battle to expand and protect market shares. Thus, in the early twentieth century advertising became not merely an adjunct to the “real business” of manufacturing; it became as vital as the steel, the workers, and the machinery because it created its own byproduct: the loyal consumer. Instead of representing a competitive selling of goods and services, advertising came to represent the competitive creation of consumer habits – and of consumers.

Because the products offered by these oligopolistic firms tended to vary little in terms of price and quality – one soap, shaving cream, or toothpaste was pretty much like another – they did not necessarily “sell themselves.” Merely stating a product's physical attributes and price did not provide a potential consumer with a reason to purchase a particular product over its competitors. Advertising copywriters, therefore, had to come up with ways to make consumers prefer one brand over another. This led to advertising strategies that attempted to capture and exploit consumers' emotions. (The classic statements remain Veblen, 1927, 1938, 1954; see also Baran & Sweezy, 1966; Curti, 1967; Jhally, 1990.) The role of advertising, then, was twofold. First, it served to establish an aura of prestige or desirability around a given product or service, thereby making it less susceptible to price competition. Second, advertising permitted firms to increase their sales without cutting prices, thereby maintaining healthy profit margins.

Advertising as a percentage of the gross domestic product (GDP) rose in direct proportion to the increase in giant corporations operating in oligopolistic markets.

It went from less than .3% in 1865 to more than 3% of GDP by 1920 (Fox, 1997, p. 39). Between 1880 and 1900, for example, the annual amount spent on advertising ballooned from \$200 million to \$542 million and helped lay the foundation for the growth and success of well-known companies such as Coca-Cola, Campbell Soup, Carnation, Quaker Oats, Heinz, Pillsbury, Colgate-Palmolive, Libby, and Procter & Gamble (Fox, 1997, pp. 38–39; Sivulka, 1998, p. 47). Since the 1920s advertising expenditures as a percentage of GDP have remained in the range of 2–3%. By 1930, advertising expenditures rose to \$2.6 billion annually (Pope, 1983, p. 23; Roa, 1998, p. 926; for a discussion of business expenditures on advertising between 1880 and 1942, see Olney, 1991, Ch. 5).

Contributing to, and profiting mightily from, the growth in national advertising was an increasingly commercial mass media. Fundamental changes within the newspaper and magazine industries at the turn of the twentieth century helped develop a media system that simultaneously served publishers' need for revenues and advertisers' desire to reach a broader public. In contrast to the pre-Civil War era when most newspapers functioned as partisan organs to gain support for a political viewpoint, many postwar owners ran their papers as business enterprises. As start-up costs and daily expenses increased, publishers no longer viewed their primary mission as that of rousing readers to support political causes. Their new objective was to offer advertisers a large audience at low cost and still turn huge profits. By the early twentieth century this had become the dominant model as an increasing number of newspapers accepted or actively sought advertising revenues to offset their production costs and came to view their readers as a commodity that could be exchanged for advertising patronage (Baldasty, 1992, pp. 59–60; see also McChesney, 1997, pp. 9–17). In 1880, for example, 44% of all newspaper revenue came from advertising. Ten years later the figure approached 50%, and by 1919 US newspapers depended on advertising for two-thirds of their income (Baldasty, 1992, p. 59; Pope, 1983, p. 30).

No medium was more affected by advertising than the magazine industry. In the late nineteenth century publishers produced a flood of national magazines for popular consumption. While differing in their editorial approach, *McClure's*, *Ladies' Home Journal*, *Munsey's*, *Cosmopolitan*, *Century*, *Delineator*, and *Scribner's* quickly gained favor with middle-class and mainly female readers, a group that advertisers were eager to reach. Unlike most newspapers, which tended to reach people in a limited geographical area, the new generation of magazines offered individual copies for sale at newsstands and therefore found a national market. (For a discussion of the rise of a national magazine industry, see Filler, 1993; Ohman, 1998, Ch. 2; Schneirov, 1994.) Between 1882 and 1885 the average October issue of *Harper's* devoted seven pages to product advertising. Ten years later the average had climbed to an astonishing 85 pages. And whereas the November 1880 issue of *Atlantic Monthly* carried only 13 pages of advertising, the December 1904 issue boasted 121 advertising pages. Other magazines could point to similar changes. By the turn of the twentieth century magazine publishers were increasingly relying on brand-name advertising for their income (Ohman, 1998, pp. 83–85; Pope, 1983, pp. 43–45; Sivulka, 1998, pp. 82–83; Strasser, 1989, p. 91).

As the twentieth century progressed people relied increasingly on mass production to fill their product needs, and US citizens began to think of themselves as consumers. Although many products had become cheap and readily available, they represented a trade-off. Consumers, who only a generation earlier had been able to monitor the raw materials' quality and the conditions under which the final products were made, increasingly found themselves at the manufacturers' mercy. Household routines involved fewer homemade items and consumption, as opposed to production, took on a central role (Strasser, 1989, p. 255; see also Ewen, 1976, p. 115; Ewen & Ewen, 1982, pp. 57–63). While some mourned a rapidly diminishing way of life, others welcomed the changes. Mass production of products that previously had required hours of work by skilled artisans enabled many people, including the poor and recent immigrants, to dress nicely and buy objects that only a few decades earlier had been reserved for the well-to-do. Writing in the early twentieth century, economist Simon N. Patten (1968) celebrated the liberatory aspects of consumer culture; a theory supported by several modern-day scholars. Kathy Peiss (1986), for example, argues that participation in consumer culture provided a coveted ticket to social acceptance and freedom from patriarchal dominance for immigrant women. Andrew Heinze (1990) claims that turn-of-the century Jewish immigrants valued consumer products as a means for achieving social assimilation and acceptance.

Although new and better merchandise could improve the material aspect of people's lives, it was less suited to fulfill other functions. Consumer society, because it emphasized individual solutions to collective problems, helped articulate a new form of citizen sovereignty. A frequent theme in early twentieth-century advertisements was egalitarianism through consumption. Advertising historian Roland Marchand (1985, pp. 217–222) has described the ways in which advertisers stressed the notion that thanks to mass production, rich and poor alike were bathing with the same soaps, eating the same packaged cereals, and smoking the same brands of cigarettes. Consumer society, because it emphasized individual solutions to collective problems, helped articulate a new form of citizen sovereignty. Gradually winning acceptance was the view that it was in the marketplace, and not at the polls, where the public should cast its vote. Within this new society, argues Charles McGovern, consumption was becoming a cornerstone, and this new version of democracy equated, even replaced, participation in civic life with spending dollars in the marketplace: "Consumption was the foundation of a distinctly American way of life; this was the new order of the ages" (McGovern, 1998, p. 50; 2006). In this setup, advertising had become the dominant lingo.

Unlike earlier forms of advertising, the brand-name variety tended to avoid copy that provided consumers with information, statistics, and the ability to comparison shop. This trend became even more pronounced after World War I. Many advertising executives learned from the successful use of wartime propaganda that powerful images and slogans provided a key to controlling the public's actions, including their consumer choices (Ewen, 1996, p. 127). Trademarks or brand names helped serve this purpose, as did advertisements that stressed glossy illustrations over information.

The emotional attributes associated with a trademark, and the corollary idea that the consumer could best be reached by an appeal to irrational thinking and unconscious desire, fit manufacturers' purpose perfectly. That scientific opinion buttressed this view legitimized, even justified, the intensified focus of business and industry on the "irrational" consumer (Curti, 1967, pp. 334–357). Marchand has shown how advertisers, playing a dual role as both coach and confidant, "guided" consumers through the task of choosing the "right" products and played on their fears and insecurities. Consumer citizenship might be easily obtained but consequences for opting out were severe. People were told that bad breath, old-fashioned furnishings, and the wrong cigarette brands could hinder professional and social success and that failure to use certain products for health, hygiene, or attire might prevent their ability to keep up with modern society, much less get ahead (Curti, 1967, p. 336).

Early Consumer Reactions

Even at its most ardent, corporate enthusiasm and a growing abundance of goods were not sufficient to mask some of the structural problems associated with a rapidly growing, and largely unregulated, consumer market. As early as the 1880s, a group of concerned citizens led by Dr. Harvey W. Wiley had begun a crusade to secure unadulterated foods. Much to their frustration, and in spite of several exposés showing the dangerous ingredients in patent medicines and the ills they could cause, Wiley and his supporters were unable to get legislation passed. The big change came with the publication of *The Jungle* by Upton Sinclair in 1906. Sinclair's bestseller exposed the unsafe and exploitative labor conditions that meat packing plants employed in order to maximize profit. The pressure put on workers combined with lax sanitary standards resulted in rotten and contaminated meat on (middle-class) consumers' tables. While much of Sinclair's call for labor reform fell on deaf ears, his plea for regulation of meat plants gained massive support. In the months following Sinclair's exposé, the sale of meat dropped drastically and President Roosevelt threw his support behind the passage of a meat inspection bill which was written into law in 1906. The momentum created by the meat inspection bill, in turn, helped the passage of a much needed Pure Food and Drugs law that same year (Nadel, 1997; Young, 1992).

The National Consumers' League (NCL) provides another example of consumer activism during this period. Formed in 1899, the NCL devoted itself to factory conditions and worked relentlessly to improve conditions for workers. Only garments produced in facilities that refused to employ children, paid its workers fair wages, and treated workers well were allowed to display the NCL's "white label." Operating in many states, the group conducted regular factory inspections and worked diligently to pass local and federal laws to improve conditions. By presenting themselves as consumers and framing their demands accordingly, activists helped forefront the

new and dynamic relationship between producers and consumers of goods (Sklar, 1998, 25; see also Sklar, 1995, pp. 309–311; Wolfe, 1975). As such, the 1906 passage of the Food and Drug Act was a great victory for the recognition of consumers' rights; a clear departure from the existing practice of viewing political issues solely from the standpoint of producers. It showed that the public, and consequently Congress, had become more conscious of the need for consumer protection. The momentum that was created inspired the creation of numerous committees, clubs, and leagues, and organizations working to further consumers' causes (Gaedeke, 1972, p. 58).

In 1927, Stuart Chase and F. J. Schlink published *Your Money's Worth: A Study in the Waste of the Consumer's Dollars*, a book that became the start of an active consumer movement in the decade that followed (Morse, 1993, p. 19). The authors exposed frauds and manipulations by US manufacturers and argued that advertising failed to provide consumers with sufficient product information. This, in turn, led people to waste money. Inefficiency in buying, the authors contended, thrived in inverse proportion to consumers' knowledge. Whereas industrial and government buyers bought efficiently because they possessed the necessary knowledge to deflate and disregard advertising, consumers were forced to rely on advertising propaganda that provided them with almost no factual information. Urging consumers to educate themselves against the perils of such marketing devices, the authors called for structural reform. Soon after the book was published, Schlink started a small newsletter called *Consumers' Club Commodity List* which rated various brand products based on laboratory tastings. By 1929, a massive public interest in the book and newsletter had spurred an organization called Consumers Research (CR). CR employed technical experts and had its own laboratory for testing consumer products. By 1932, Schlink's newsletter was renamed *Consumers' Research General Bulletin* (and later yet simply the *Consumers' Research Bulletin*) and boasted an impressive 42,000 subscribers (Mayer, 1989, p. 21; Silber, 1983, p. 18; see also Ayres, 1934, pp. 158–165). CR attracted a group of prolific authors who wrote articles and bestselling books on consumer-related issues and received support from a range of professional organizations, including the General Federation of Women's Clubs, the American Home Economics Association, and the National League of Women Voters. Also very important were the many politically connected individuals who shared the organizations' call for federal regulation of advertising.

The Struggle Over Federal Regulation of Advertising in the 1930s

The Federal Trade Commission Act of 1914 had given the Federal Trade Commission (FTC) jurisdiction over advertising. This power, however, was limited to cases where one business used advertising to gain unfair advantage over another. Thus, the FTC

lacked the jurisdiction to intervene on consumers' behalf when they were wronged, even harmed, by false and misleading advertising (Tedlow, 1981). Thus, considerable momentum for stricter advertising regulation existed by the time of Roosevelt's inauguration in 1933. In June of that year, a bill to amend the 1906 Food and Drug Act was introduced in Congress. The measure, which had been truly whetted by CR, proposed new labeling laws and mandatory grading of goods as a means to guiding consumers in the marketplace. It also sought to empower the Food and Drug Administration (FDA) to prohibit false advertising of any food, drug, or cosmetic. Catching advertisers' immediate attention was a stipulation in the bill that defined an advertisement as false if it used "ambiguity or inference" to create a misleading impression (Pease, 1958; Young, 1992). Few, if any, major manufacturers objected to a ban on false advertising but their reaction to the proposed ban on "ambiguity and inference" was strong and adverse. It was exactly the use of clever advertising to create enough ambiguity for consumers to infer the desirability of one product over another, even if none existed, that drove most of the consumer industry and, thus, much of capitalism at large. But business was fully aware that this rationale for advertising might sound hollow, especially to consumers affected by a severe economic depression, so they tried their best to avert direct discussions of this issue. If anything, the industry argued, consumers should be grateful because advertising had brought them conveniences and cheap mass produced products. The same business interests also objected to the bill's demand for grading of consumer goods, arguing not only that it was impossible to establish uniform quality standards but that they were unnecessary because they already provided consumers with sufficient product information. Consumer activists were just as unhappy with the bill. Their complaint, however, was that the bill did not go far enough in terms of providing consumer protection (Stole, 2006).

This set the stage for a five-year legislative battle with congressional hearings over several revised versions of the bill. Helping the advertising industry's cause was a set of well-developed public relations and lobbying strategies and considerable influence over the commercial mass media. Few among the general public were fully informed of the issues at stake. With each new version of the bill, industry concerns took the front seat and the issue of consumer protection, which had first spurred the bill, gradually faded from the agenda. Despite demands from consumer groups, New Dealers, and government regulatory agencies, advertisers survived the battle with surprising ease. When the Wheeler-Lea Amendment to the Federal Trade Commission Act was passed in 1938, it reflected five years of legal wrangling and extensive public relations efforts to render such protection painless for business interests.

The practical application of the new law proved that consumer advocates had been right in fearing that the new law would fail to provide consumers with any substantial protection. The major shortcoming was the law's failure to encourage advertisers to provide more factual information in their ads. The immediate and somewhat ironic effect of the Wheeler-Lea Amendment to the Federal Trade Commission Act was a

tendency toward increasing glamour and indirect assertion. Because it was relatively easy to check the truthfulness of explicit written claims, advertisements increasingly relied on the use of pictures and illustrations to get around the law. Most advertising agencies were inspired to design copy that complied with the law yet served the purpose of techniques that the amended version of the Federal Trade Commission Act rendered illegal (Pease, 1958).

In sum, the Wheeler–Lea Amendment and the regulation it spawned were crowning achievements for the advertising industry. Nevertheless, the industry knew it could never take the lax regulation by the FTC for granted. As an industry it was always susceptible to public criticism for its sometimes controversial operations, which might lead to increased FTC regulation, or even to Congress reopening the matter of advertising regulation for further consideration. Recognizing that further advertising regulation was favored by a substantial segment of the population, the industry keeps a close ear to the ground, hoping to protect the status quo and nip new challenges in the bud (Stole, 2006).

Advertising in World War II

As important as the 1930s were, the battle over the role of advertising in the nation's political economy that began in the 1920s ended not in 1938, but during World War II. The war elevated the seeming contradictions of advertising and allowed the consumer movement one final opportunity to corral and regulate this institution. Thus, it was the war experience, even more than the legislative battles of the 1930s, that defined the role of advertising in the postwar political economy and cultural firmament.

During the two-year period leading up to the attack on Pearl Harbor in December 1941, war-related production required an increasing and disproportionate share of the nation's labor and raw materials. Production for the consumer market was constrained as a result, and concerns about inflation led the government to consider price controls. Advertisers worried that encouraging people to consume during a period when raw materials and consumer products were scarce and almost no new products were being launched might lend credence to the argument that advertising was wasteful, if not downright unpatriotic (Stole, 2001a). Adding to the industry's concerns were the government's proposals to eliminate advertising's tax-deductible status (a system that had been on the books since right after World War I) in order to pay for defense-related expenses.

Getting on the good side of government was a high priority among advertisers, and industry leaders were quite excited when within days of the fateful attack on Pearl Harbor, the director of priorities in the government's Office of Price Administration (OPA) approached the advertising community to request promotional assistance. The result was the creation of the (War) Advertising Council, an

industry-wide effort that urged, coached, and assisted individual advertisers in incorporating the government's home-front messages into their regular product advertising.

Madison Avenue was particularly fortunate to have a strong supporter in Treasury Secretary Morgenthau, who was one of the first government officials to seek help from the Advertising Council. By 1942, the Treasury Department relied almost entirely on the council's help in promoting war bonds and stamps to the US public. The sale of these securities allowed the government to borrow money for the war effort from its citizens, and this relieved some of the pressure for new tax revenues. The importance of this connection was not lost on the Advertising Council, which addressed the task with great urgency. It designed an elaborate campaign plan and instructed individual advertisers to incorporate the war bond pleas into their product advertising. Much to the advertising industry's relief, the Treasury quickly acknowledged that a pending law to prohibit, or severely restrict, advertisers' ability to deduct advertising expenses from their income taxes would translate into less publicity for the Treasury's own campaigns. Consequently, it ruled in the advertising industry's favor, allowing "reasonable and normal advertising" as a deductible business expense for the war's duration. Encouraged manufacturers utilized their advertising to tell the US people about their "patriotic" contributions to the war effort while the real winner was the advertising industry itself (Fox, 1975; Stole, 2001b).

Consumers Union (CU), which by the 1940s had replaced Consumers Research as the major consumer advocacy group, responded to the war emergency with the addition of a new publication to its existing *Consumers Union Reports* (which changed its name to *Consumer Reports* in 1942). First published in February 1941, *Bread and Butter* was designed to "help consumers protect their living standards by providing them with up-to-date reliable information about what is happening to the prices and quality of consumer goods" (Consumers Union, 1941). While most advertisers showed only a modicum of interest in the task of informing war consumers about pricing and product attributes in their advertising, the CU publications explained the practical changes brought about by the war emergency. It discussed issues such as how to plan and grow victory gardens, how to care for products and make them last, and how to save money on home canning of fruits and vegetables. Now more than ever, CU considered advertisers' established practice of stressing emotional satisfaction over product information as an obstacle, rather than constructive assistance, for consumers. It urged consumers to organize and put pressure on the government to make sure their interests were represented while promising to exert its own "united pressure towards the job of maintaining a healthy, strong, alert America to win the war – building a greater, more prosperous America after the war has been won" (Consumers Union, 1941). And while advertising might instill in consumers a certain desire for goods that were no longer readily available, *Bread and Butter* and *Consumer Reports* stressed the unpatriotic aspects of buying products on the black market.

The activist cause was further complicated by the interdependent relationship between advertisers and the commercial mass media. At the same time as the

industry's contributions were elevated to patriotic levels, critics were allowed few chances to be heard. Journalists and editors were hardly encouraged to pursue stories critical of an industry of which the news media were, in effect, a key part. Whatever benefits the newly emerging professional journalism may have offered with respect to protecting editorial content from the influence of media owners and advertisers, they did not extend to providing for ample and balanced coverage of advertising policy debates in this period.

While the industry's contribution was elevated to patriotic levels, those with critical views on the advertising industry's prerogatives were given few chances at a large audience. It should hardly come as a surprise, then, that an industry sponsored survey in the summer of 1943 found a full 84% of the respondents believing that advertising contributed to the US war effort (Advertising at work, 1943; ANA finds public appreciates war advertising, 1943). Even allowing for a survey designed to flatter the industry and ignore or distort criticism of the consumer movement, the results suggest that the battle for public opinion may have swung to the advertisers. Most citizens, it seems safe to say, did not know that there was any alternative.

The end of World War II found the advertising industry in an enviable position. Through its wartime services to the government, the Advertising Council had fulfilled an important public relations function. Its immediate objective had been to protect advertisers' right to advertise throughout the war, despite major shortages that logically suggested that advertising might stimulate demand, spur inflation, and prove counterproductive to the war effort. An important secondary goal had been to secure the status of advertising as a tax-deductible business expense by defending its privileged wartime position, by claiming that it was playing an indispensable patriotic role. The unstated but overarching goal was to have the US public internalize a view of the advertising industry as a democratic institution that had been instrumental in winning the fight against the Axis Powers. The purpose of the Advertising Council, as Frank W. Fox (1975, Ch. 5) argues, was to promote "the ad behind the ad," that is, to use advertising to sell not only products but also the institution of advertising itself, as well as the corporate system behind the products.

The Postwar Era

By the end of the war in 1945 the advertising industry found itself in a quite favorable position and faced the postwar era with renewed enthusiasm. Due in part to the Advertising Council's work, the industry enjoyed an increasingly congenial working relationship with government leaders, something that sociologist C. Wright Mills (1956) and others so aptly identify. Upon recognizing the Advertising Council's PR value, the industry decided to make it a permanent postwar fixture. No longer affiliated with the government, the postwar Advertising Council was free to chart its own course. Whereas the council's wartime campaigns had asked people to plant vegetables

and buy war bonds to express their patriotism, its postwar campaigns commercialized this noble sentiment. Patriotism was now tied to the unconditional acceptance of free enterprise, which some now termed "People's Capitalism."³ The Advertising Council's new intent, observes the historian Robert Griffith (1983), was to "promote an image of advertising as a responsible and civic-spirited industry, of the US economy as a uniquely productive system of free enterprise, and of America as a dynamic, classless, and benignly consensual society" (p. 388).⁴ Its postwar campaigns and unconditional declaration of "true Americanism" helped to stifle and mute advertising criticism (Grabner, 1987; Lipsitz, 1990; May, 1990; Miller & Novak, 1977; Pells, 1989; Whitfeld, 1992). If in the 1930s advertising had been a controversial, even scorned, undertaking in the minds of many US citizens, it was now, 20 years later, presented as a fixture of the "good life" and the "American Dream."

The impact and proliferation of advertising were evident in other contexts as well. In 1942, the Supreme Court had ruled unanimously against First Amendment protection for advertisers. But gradually, and as many social institutions became increasingly beholden to advertisers, commercial speech won a series of important judicial victories. At the same time, and as shopping malls replaced Main Street as the central site for commerce and congregation, mall owners fought several successful legal battles to prevent political opinions and politically controversial ideas from entering the new public spheres. Such ideas, it was believed, might interfere with the mall visitors' shopping experience and ability to express their freedom (of choice) as consumers (Cohen, 2003, pp. 274–278).⁵

The sudden popularity of television put people in even closer proximity to advertising, and, as Lawrence R. Samuel and other scholars argue, the seamless merging of entertainment and commercial values in this new medium helped fan the flames of consumerism and spending in the postwar United States (Lipsitz, 1990, Ch. 1; Samuel, 2001, Intro.).⁶ In sharp contrast to the discourse surrounding the introduction of radio a couple of decades earlier, television faced no serious challenges to its purely commercial nature.⁷ Convinced that increased levels of advertising would boost consumption, combat economic sluggishness, and raise the standard of living, the federal government supported television's commercialization (Lipsitz, 1990, pp. 44–46).

Television was only one example of government policies that directly and indirectly supported the growth and proliferation of postwar consumer society. In addition, and as historian Lizabeth Cohen (2003, pp. 274–278) has shown, postwar laws, regulations, and zoning practices helped foster this culture by providing the infrastructure for a large (white) middle-class exodus to the many suburban areas of large cities.⁸ Pressures to consume and conform were part of the suburban experience, where "Keeping up with the Joneses" was considered essential in order to be accepted in the community (Chafe, 1972; Ewen & Ewen, 1982; Hartman, 1982; May, 1990; Miller & Nowak, 1977; Nowak, 1975). Between 1946 and 1950, US citizens purchased 21.4 million automobiles, more than 20 million refrigerators, 5.5 million electric stoves, and 11.6 million television sets (Hartman, 1982, p. 8).

The emphasis on private consumption represented a perfect merger of two political objectives: the need for corporate profits and the use of private consumption as an anti-communist definer. In 1959 when Vice-President Richard Nixon visited Moscow, Nixon and Nikita Khrushchev got entangled, not in discussion over disarmament or nuclear power, but over which country could produce the best home appliances. According to Nixon, what made the United States so great was the nuclear family. Nixon insisted that US superiority in the Cold War rested not on weapons, but on the secure, abundant family life of modern suburban homes. Consumerism was not an end in itself; it was the means for achieving individuality, leisure, and upward mobility. At the very center of success was the nuclear family with its working-class, happy kids and a full-time homemaker who cooked, cleaned, and shopped for the family (May, 1990).

This does not mean that advertising as a cultural phenomenon was no longer controversial. The postwar decades were rife with satire and criticism of the asininity of advertising, ranging from novels and films like *The Hucksters* and satire such as *Mad Magazine* to exposés like Vance Packard's *The Hidden Persuaders* (1958). What had changed was that while advertising could be lampooned, and specific ads or advertising practices criticized, its institutional role had become off-limits for fundamental debate. The caliber of criticism that had been routine in the 1930s and early 1940s was pushed to the far margins of acceptable commentary. It seemed implausible that there could be a good society without advertising as we had come to know it.

Decreased consumer militancy coupled with new consumption patterns also affected CU. Many consumers became interested in learning as much as possible about products before they purchased them, and the circulation of *Consumer Reports* skyrocketed. In March 1944 the magazine had a circulation of only 55,000, but by June 1949 the number had increased to 275,000. Despite the fivefold increase in circulation, the magazine's leaders were frustrated in their efforts to reach a socioeconomic cross-section of US consumers and continued to appeal primarily to professional middle- and upper-middle-income individuals. By the mid-1950s, largely due to a series of unsubstantiated accusations of communist activity, CU downplayed its activism component (Katz, 1977).

The general absence of public objection to commercialism during this period did not necessarily mean that such sentiments did not exist or that everyone welcomed the changes. An increasing number of scholars contend that most histories of the postwar United States fail to account for the psychological complexity of those years, including the vitality and variety of subordinate cultures that flourished. "If consensus did indeed characterize America's national culture in the 1950s," Robert Griffith (1983) remarks, "it was perhaps to a degree we have not fully appreciated, a consensus manufactured by America's corporate leaders, packaged by the advertising industry, and merchandized through the channels of mass communication" (p. 412; see also Jackson Lears, 1989; Koontz, 1992; Susman, 1989).

It was not until the 1960s that the United States would experience yet another intense wave of politically organized consumers. Throughout the 1960s and early

1970s consumer organizations witnessed steady support for their demands, and a variety of national consumer groups, each with specialized interests and some with charismatic leaders, emerged.

Consumer Resistance in the 1960s, 1970s, and Beyond

The postwar consumer momentum continued into the 1960s but it did not take long before the illusion of consensus about advertising and the corporate culture it supported came under severe criticism. Back in the early 1950s, critics like David Riesman (1953) had received attention but little support for the opinion that the US obsession with consumption and material abundance had led people away from a tradition of self-reliance and toward a habit of defining themselves as a function of other people's lives and (consumer) habits. Neither did works by C. Wright Mills (1956) and David Potter (1962) cause people to reject the consumer ethos, and John Kenneth Galbraith (1958) gained little public traction for his claim that advertising artificially created high rates of consumption to support high rates of production and that it artificially created high rates of production to support high rates of consumption.

By the early part of the 1960s, however, an increasing number of people started to question aspects of consumer society and some even rejected it altogether. Issues such as advertising's power to define female beauty and its tendency to depict women in stereotypical ways became a great concern during this period, which also witnessed an intense but largely unsuccessful effort to regulate children's exposure to advertising. In his book on the 1960s advertising industry, historian Thomas Frank (1997) discusses ways in which advertising copywriters co-opted this criticism, using it to create new market segments in order to sell products to the increasingly cynical consumer.

The most influential person in what would be known as the third wave of consumer activism in the 1960s and 1970s was without doubt Ralph Nader. In 1963 the young lawyer published *Unsafe at Any Speed*, a highly acclaimed and widely discussed exposé of the auto industry and its utter disregard for consumer safety (Nader, 1973). Later, Nader transformed his interest in consumer issues into a movement that could effectively counter the power held by business in the marketplace. With the help of associates he uncovered abuses against individual consumers, and in 1968 he recruited a task force of students to investigate the FTC, an agency so manipulated by business that it was unable to fulfill its mandate. Hoping to invigorate the citizenry to fight corporate power and make businesses accountable to the people, Nader experimented with new strategies for action. His efforts had a strong impact, and in the period between 1967 and 1973 Congress enacted more than 25 laws to regulate corporate conduct in consumer and environmental fields (Pertschuk, 1982).

A watershed in the third era of consumer activity was the 1978 defeat of legislation to create a consumer advocacy agency. The idea of a Department of the Consumer to parallel the Departments of Commerce and Labor had first been introduced back in the early 1930s. In the 1970s and under the leadership of Nader, however, attention shifted from the creation of an agency without regulatory powers to one entrusted with monitoring the activities of other government agencies and, if necessary, the authority to intervene in their regulatory decision-making on consumers' behalf. In spite of massive support from consumer advocates including the Consumer Federation of America and a newly invigorated CU, the plans were thwarted by commercial interests. Arguing that the proposed agency would create a new bureaucracy, increase the complexity of regulatory hearings, and force the disclosure of trade secrets, business interests used their powerful lobbying arms to help defeat the plan (Herrman & Mayer, 1997). Organized consumer efforts to expand the FTC's regulatory powers and regulate the commercial targeting of children faced a similar fate. By the late 1970s, most of the gains that had been made in the early part of the decade were lost (Pertschuk, 1982).

Some of the activist momentum survived into the 1980s but quickly lost ground amid the neoliberal policies that came into full force during the Reagan presidency. Deregulation of the telecom industries provided advertisers with new and expanded venues. In the competitive environment that followed, mass media became increasingly reluctant to discuss issues that might put their commercial benefactors in a negative light (McChesney, 1999, 2004).

It was not until the 1990s that consumers again rose in unison and this time on a global scale. Consumer activism had been part of the European landscape since the 1930s and by the 1970s and 1980s concerns about increased commercialism had spread to Asian countries. Due to different degrees of commercialization and variations in each country's consumer protection laws, consumer protest took different forms although international cooperation on issues of common interest did happen. Although important in its own right, this work was rarely grassroots driven. (See entries for individual countries in Brobeck, 1997; Chadwick, 1997; Frith, 1996; Gao, 2005; Samiee & Ryans, 1982.)

This changed in the late 1990s with the rise of a new wave of consumer activism, this time with a global scope. The frequent reference to this as the "anti-globalization movement" did not mean that its proponents were xenophobic or nationalistic; they simply found a common ground in opposing globalization that serves investors and corporate interests, not globalization *per se* (Klein, 2000; Korten, 2001).

Sweatshop conditions, child labor, environmental regulation, food safety (genetically engineered foods), corporate power (the World Trade Organization, the International Monetary Fund, the World Bank), and over-commercialization were among its major focuses. Its heterogeneity hearkened back to the first wave of consumer activists in the Progressive Era and its emphasis on labor conditions and public health across all classes, but now from a global perspective. Likewise, in comparison to their 1930s US counterpart, the globally oriented activists questioned the impact of commercialism, but now

in a broader context. Not only were workers in poor countries being exploited, the fruit of their labor was destroying the social and cultural fabric across the globe (Barber, 2008).⁹ The call, as in the United States in the 1960s and 1970s, was for increased corporate accountability. But ironically enough, given that we live in the so-called information age, corporate conduct, including its commercial strategies, is more difficult to monitor than ever. Because commercial values have become entrenched in our everyday life and commercial speech is gaining increased First Amendment protection, consumer advocates and citizens face a harder challenge in gaining a critical perspective on commercialism.¹⁰

Conclusion

At this time there are strong indications that the most recent wave of consumer activism has lost ground or is, at best, refocusing. Capitalist culture, on the other hand, is not showing any signs of slowing down, leaving consumer activists to fight an uphill battle.

During the last two decades, advertising and consumer culture have been subjected to a great deal of scholarly interest both in the United States and abroad. Still, in order to map the economic forces that dictate the increasing levels of commercialization across the globe, we need more scholarship to focus on these issues. Not only is it mandatory to keep track of contemporary developments and how they shape the changing concept of consumer culture, it is also important to trace these events to the past. Although far from answering all questions, historical inquiries into advertising and the shaping of consumer culture may provide some explanation for our present-day situation. Knowledge of the political decisions that form the basis of our present-day consumer society would not only fill a gap in our understanding of twentieth-century history, it might also inspire consumer activists, providing them with a better foundation for the fight against corporate hegemony.

NOTES

- 1 The total amount spent on advertising in the United States during 2007 was \$279,612 million, which represented 2% of total GDP. Retrieved January, 25, 2011, from <http://www.galbithink.org/ad-spending.htm>.

The Rise of the Professional Communicator

Kevin G. Barnhurst

ABSTRACT

Professionalism became an ideal for organizing work in the nineteenth-century United States and reached communication occupations by century's end. Its rise continued an early modern tradition that embodied knowledge in specialists engaged at universities and in practical projects. A sociology of professions emerged by the twentieth century to describe their characteristics, a useful template for professionalism in communication and applied to newswork as a case prominent for its claim to serve democracy. Arguments over whether journalists have professional traits may discount their importance as workers involved in power-as-knowledge, with consequences for workers in the twenty-first century as US professionalism spreads abroad.

The rise of the professional communicator is part of an ongoing story about the elevation of craftwork to a higher plane as knowledge work. The story can trace a main branch of its lineage to medieval Europe and the ideas that set in motion what became the modern world. The term *profession* has roots in the Middle Ages, when divinity, medicine, and law emerged as primary occupations for gentlemen of the era to pursue. The three learned professions owe their deep foundations, as “true” professions and the measure of other occupations, to their early start in Western history.

But the organization of professions in the sense understood today is a product of the nineteenth century. Sociologists have considered “professions” either a bundle of traits that characterize certain occupations or a way of organizing occupations that tends to enhance their power. Workers today in the communication industries are professionals in the more recent sense of the term. The distinctions among professions (and ongoing arguments about who qualifies as a professional) are perhaps trivial in light of the fundamental quality of all groups claiming professional standing.

That quality is the relationship of professional workers to knowledge. A profession is a social organization that establishes itself through knowledge practices. Communication workers acquire professional status by establishing work patterns and output norms, educational programs, associations, and other activities typical for their line of work. The norms and structures of the group may seem to make them professional, but the force underlying professional activity is ideas. Professions depend on a relationship with knowledge that colors their relations with the state, institutions, other groups, and individuals in society. In social communication, newswork is a central case in the history of professionalism, especially in the United States, where communication work took part in a national faith in professionalism.

Organizing media work along professional lines has had consequences for power relations in the workplace and in conceptions of and relations with the public. In turn, the project of making communication work professional has larger implications for conditions of knowledge affecting the other knowing professions. In recent decades communication professionals have struggled and lost some status through the reorganization of knowledge into digital forms, and the fate of the professional hangs in the balance.

Establishing the Early Professions

In the emergence of professions one can see a relationship between power and knowledge and a pattern of extending that relationship as professions acquired their earliest trappings. In medieval Europe, knowledge centered on truth and recognizing God behind all truth (McKeon, 1930), and so power traced its roots to religion, which gave legitimacy even to kings. What everyday folk knew about objects in the world belonged not to knowledge but to a lower order of knowing (Markus, 1970). Augustine, like Plato, assumed that human observation could not reach true knowledge (Copleston, 1950). The rise of universities set up independent and, within their limited sphere, democratic locations of knowledge. The religious orders were quick to claim chairs of theology that established their place in universities. Theology and philosophy were sciences, and theologians and philosophers possessed knowledge (Copleston, 1953), even though those in authority, in the commonplace of the era, had “a nose of wax” that the powerful could bend toward their own ends (Armstrong,

1970; Hyman & Walsh, 1967). But universities were important for asserting knowledge as an autonomous, somewhat self-governing seat of power alongside the church, setting the pattern for professions to push for recognition within universities.

Growing out of a foundation in universities, one pillar of professions became access to knowledge independent of God's truth. Some Renaissance thinkers emphasized how knowledge could bear practical fruit, and the scientific movement of that period led to a separation from philosophy and toward the main thesis of empiricists: that factual knowledge depended on the observer's direct acquaintance with events. (The corollary was to separate humans from nature and facilitate an extractive view of the natural world.) In the fourteenth century, the English philosopher William of Ockham argued that observing regular sequences was the only way to discover the causes of phenomena (Copleston, 1953). Ockham's thesis stands behind subsequent notions of communication, and journalism began as an activity to produce useful goods by extracting stories and facts from social life.

By the seventeenth century Francis Bacon (1863) suggested in an essay on heresies that God's knowledge is power (*scientia potestas est*), a phrase that came to justify the pursuit of knowledge for its practical utility. Printing was a key example of how practical invention "changed the face of things and the state of the world" (Copleston 1953, p. 104). For Bacon (1851) human knowledge and human power amounted to the same thing, and as a new sense of "science" emerged, theologians and philosophers lost power. They no longer held the center of knowledge; others, especially scientists, did. In the modern sense, science follows Bacon's (1908) axiom, "for knowledge itself is power" (p. 96). The axiom also underpins much of the activity and sense of purpose behind occupational groups involved in communication, especially journalists.

Another core value in communication practice goes back to Europe of the sixteenth and seventeenth centuries, when truth was a quality of gentility. European society divided between gentle and non-gentle persons, and little about life had the substance, consequence, or divisiveness in society as the project of marking where and how to draw the line between the two (Shapin, 1994). The only distinction of greater cultural significance was the separation of Christians from heathens. *Gentlemen* were capable agents for sensing, and could reliably report on, nature and society. The system still considered women as well as the poor and lower classes unreliable, even before the law. The status of women has improved, but communication practice and especially journalism accept a genteel perspective on the obligation to inform those with less access to the powerful. That service mission helps support a claim to professionalism.

A pillar of professional standing is expertise. From among the gentle, specialists in knowledge emerged: not only men of learning (*docti*) or letters (*literati*), but also learned laymen, usually either physicians or lawyers (Burke, 2000). Expertise grew more important during the Enlightenment project to amass knowledge (Heyer, 1988). In the Enlightenment, encyclopedists divided knowledge into fields that a handful of accomplished experts dominated (Darnton, 1979). Knowledge became

specialized and its operation professionalized, following an order derived from the data of the senses and from rationality that grew out of experience. As the division of labor became stronger in intellectual activities, public communication became more important. Without it elites could lock up knowledge “to the detriment of all” (Yeo, 2001, p. 246). Much later journalism developed part of its special status from that same democratic urge to disseminate knowledge widely. But in the Enlightenment era, the work of encyclopedists and the division of knowledge work gave rise to the charge, familiar to journalists today, of spreading only superficial knowledge.

Professional Organization of Knowledge

New professions grew out of a relationship among the ideal of science, the urge to solve practical problems, and the growth of social organization to apply the knowledge resulting from scientific inquiry. The age of science as systematic thought about the physical world was in full swing by the early seventeenth century but existed in something of a vacuum as “pure science” for more than a century (Carr-Saunders & Wilson, 1933). Practical thinkers and inventors from outside of learned communities were more likely to apply ideas from science when confronting concrete problems, and so for instance, military engineers along with scientists gave rise to the profession of civil engineering. A propitious combination of practical problems and scientific solutions depended in turn on the rise of bureaucratic organization. Large-scale engineering projects required new kinds of organization for industry, which depended in turn on ways of accounting, financing, and insuring projects. The sites around them reorganized as well, giving rise to new local government offices along with expert handlers of property, such as surveyors. National laws created new conditions for transport, such as the merchant marine, and for materials extraction such as mining. Unlike the original learned professions, the newer knowledge workers emerged not from the sacred zones of religion or universities but from the profane zones of war, commerce, and government.

The then-new professions claimed technical competence but also moral standing (Carr-Saunders & Wilson, 1933). They established examinations or other methods of selecting their members to assure standards of competence, and they imposed discipline on their members largely through peer pressure and respect for tradition, although harsher measures could exclude a member from the professional ranks (Hughes, 1958). Periods of apprenticeship integrated both aspects of the profession, so that the training merged practice and attitude of mind not unlike preparation for a religious vocation. Stages in the development of professionals became a predictable career not unlike the journey in medieval craft guilds from apprentice through journeyman to master of the trade. But among professions the economic conditions usually ride in the background. New professions emerged only by controlling access to specialist knowledge through the high costs involved in securing qualifications.

And training came not only dear but also associated with markers of status from the sources of patronage or sponsorship (Elliott, 1972). The market was one of the main conditions surrounding the rise of professions (Larson, 1977), along with an identified problem, scientific solution, bureaucratic order, and industrial organization, but always on a background of moral order. The resulting kinds of knowledge become ingrained in the professional's actions and character, like the sense journalists have for a practical "nose for news" along with their zeal to serve the public good in twentieth-century communication practice.

Through the eighteenth and nineteenth centuries a process developed for emerging professions, along with an attendant sociology of professions. Sociologists identified typical activities: occupational grouping, training, building a formal association, seeking external recognition, and ethical code writing (Moore 1970; Wilensky 1964). Full-time workers could move toward professionalism only if their occupation involved "brain work" along with the manual labor necessary to put the group's knowledge into action. An element of status was part of the first activity, which accompanied non-manual work but could depend on whether the occupation grew out of an existing profession as at first a subspecialty or the new professionals served a high-status clientele. The first generation in a new knowledge area tended to be older experienced workers (Elliott, 1972), who then devised ways to select others for the occupation, usually through training in its arcane knowledge. In the third activity workers organized into an association and created organs that gave it institutional form, such as publications, a library, or perhaps meetings (Hughes, 1958). The new profession would then go public in the fourth activity, seeking recognition of its standards and conditions for entry, sometimes through licensing or other legal requirements. Establishing a code of ethics marked the fifth activity and the entry of the profession into maturity. Ethical codes reassured a public suspicious of specialty knowledge but also assured the occupation enough freedom and autonomy to carry out its mission of public service. Occupational groups doing manual labor with no claim to "brain work" could not gain a foothold in professionalism, but mature professions had in common all or most of the same traits, the functional qualities distinguishing learned professions from common labor.

The functions involved in establishing new professions in general did not apply to all occupational groups entering the processes of professionalism, giving rise to disagreements over kinds of professions, whether some were "true" based on their characteristics and trajectory in acquiring traits. It is clear that the foundations of professionalism were in place in the later nineteenth century. Their root was philosophical, emerging from widespread ideas about work and society. They depended on an economic groundwork that grew out of industrial conditions and involved organizational shifts that emerged earlier with bureaucracy but led into "scientific" management thinking like Taylorism in the early twentieth century.

Workers in "the media," a term first applied to the press and radio of the 1920s (Barnhurst & Nerone, 2012), did not all move at the same pace, go through the same activities, follow them in the same order, or reach the fullness of professionalism

with codes of ethics and an elaborated sense of public service, because conditions differed for each industry in what became known as “mass communication” in the 1930s. Trades connected to advertising agencies such as commercial artists, for instance, developed courses and textbooks early in the twentieth century along with some organizational structures. But serving commercial clients was not seen as a disinterested mission, and graphic artists did not acquire a professional level of social conscience until decades later, when they began to see an instrumental role for themselves informing the public and a public-service role protecting the environment in the design of material products and creating conditions for democracy with cogent, accurate information.

Communication Work Becomes Professional

However, news work developed all of the traits of professionalism by fairly early in the twentieth century and came to be weighed as a form of knowledge (Park, 1940). Populist notions about serving everyday readers supplied a ready-made mission to serve the public. Newspaper businesses were manufacturers that had already adopted industrial organization in the later nineteenth century, and the long history of newspaper involvement first with political parties and then with political movements such as Abolition placed the press alongside government as a watchdog protecting the public estate. Newspaper publishers had moved easily between high positions in the press and government in the nineteenth century (Pasley, 2001) and in the twentieth were aware of their position of power as political knowledge brokers subject to public suspicion. Industrial developments encouraged professionalism not for publishers but for the newswriters they employed. Allowing news reporters, writers, and editors to claim professional status and allowing their occupation as “journalists” to acquire professional traits would reassure the public of the service newspapers provided for democracy.

The new occupational structure for journalists emerged quickly in the Progressive Era. The press had already transformed itself from party to general-interest organs, and the labor of newswork reorganized (Hardt & Brennen, 1995). Newspapers had long depended on correspondents, literary men (for the most part) who traveled abroad or moved through the urban world as observers in a style not unlike that of early modern gentlemen. In the nineteenth century John L. Given, who wrote for the *New York Evening Sun*, remembers the day when a writer could stroll or stand “idle at a street corner waiting for something to happen.” There was “no rush or jostle about newspaper establishments,” said Colonel A. K. McClure, editor of the *Philadelphia Times*. John Addison Porter of the *Hartford Post* recalled that the newspaper office valued “literary skill and book knowledge.” The prime example of the literary newsman was Charles A. Dana, editor and publisher of the *New York Sun*, whose adage for success was, “Never do anything in a hurry” (quotations from

Wilson, 1985, pp. 26–28). Education, taste, and access to society and power made correspondents desirable and worldly witnesses, and their affluence or literary aspirations made remuneration a lesser concern. But industrial newspapers required a constant flow of material to fill the columns, especially as display advertising emerged and newspapers grew in size with larger formats and, late in the nineteenth century, with more pages to fill.

In the early phases of becoming industrial, newspaper offices employed a second kind of worker, news gatherers in factory style who combed the city for occurrences that would grab editors' and public attention. Editors like William Randolph Hearst and Joseph Pulitzer "narrowed the distance between the news event and its deadline, intensified the pace of office work," and turned news into a perishable product that lost value if "not harvested, processed, and delivered in a matter of hours" (Wilson, 1985, p. 26). Unlike correspondents involved in literary work, newshounds competed for the stories and stunts that would sell copies on the streets and worked under time pressure. John Given recalls a worker could get fired for being "a little slow getting to a telephone" (quoted in Wilson, 1985, p. 31). The typical young worker spent long hours for little pay and typically left the job after a few years (Smythe, 2003). Lincoln Steffens called news reporters of the era *machines* (quoted in Matheson, 2000, p. 565). By turning occurrences into stories quickly, newshounds processed the stuff of everyday life into texts that paid them by the column inch, filling the insatiable maw of the industrial press.

Making newswork professional involved a merger of the correspondent and the scavenger into the "journalist" (Barnhurst & Nerone, 2002). The process began in the nineteenth century and launched one basic activity typical of professionalism. Publishers and editors appear to be the first to have claimed journalism as an "editorial" profession (Banning, 1998), but a new occupational grouping took decades to solidify at the street level. Newsgathering required the physical labor of going to sites of potential occurrences and the manual labor of composing at the typewriter (Salcetti, 1995), an invention that had come into common use for business correspondence in the mid-nineteenth century. But the fusion of corporal with literary labor gave journalism the "brain work" dimension of professionals. Whether (and which) editors remain "journalists" has come to depend on contract terms and conditions in newsrooms, but the higher status of correspondents contributed to the growth of professionalism, as did the relationships journalists could develop with persons of status. Members of high society engaged in charities, debutante balls, business openings, and the like at least tolerated (or by the twentieth century sought) attention from the press.

Newspaper publishers supported the second activity typical of professionalism, establishing a system of training. Publisher Horace Greeley in 1860 said that he "would not hire a college graduate" (May, 1986, p. 20), but General Robert E. Lee gets credit for the earliest effort to establish journalism education at Washington College (Banning, 1998). Publishers later pushed individually or through press associations for university journalism classes, programs, and schools and funded the

effort. As early as the 1870s, classes in journalism ran for some years at Cornell and the University of Missouri (Mott, 1962). Certificate programs and curricula emerged by the end of the nineteenth century, and schools of journalism appeared in the first decade of the twentieth century. The universities of Missouri and Illinois established degree programs, and Joseph Pulitzer proposed to endow a school at Columbia University.

Founding associations, another activity typical of professionalism, began in the nineteenth century. Editors and publishers organized first, founding press associations in Illinois in 1865, Missouri in 1867 (Banning 1998), and other large states in the 1880s. Regional associations followed, such as the Inland Press Association in 1885, and the American Newspaper Publishers Association began in 1887. Workers in the emerging journalism occupation also founded associations. The National Editorial Association began in the 1880s (Winship, 1904), and a group of “newspapermen” formed the National Press Club in Washington, DC, in 1908 as a private society for those in the “vocation” to meet but also to foster their development as a profession. A year later Sigma Delta Chi, a journalism fraternity, began at DePauw University in Indiana (Glenn, 1949). The society spread to other universities but did not become the Society of Professional Journalists until much later. Editors of major newspapers organized separately in 1922, meeting in New York to found the American Society of Newspaper Editors (Mott, 1962). Because professions tend to stand on expertise and have considerable financial autonomy, they generally avoid affiliation with organized labor, but in the Depression era journalists formed a labor union, the American Newspaper Guild, in 1933.

Publications and meetings are common forms among all professional groups as an aspect of giving associations an institutional presence. Groups of publishers and key editors met and founded a “trade press,” the term for specialty periodicals serving an industry by region or sector of the national economy. Trade publications illustrate the emerging debate over professionalism in newswork (Cronin, 1993; Plaisance, 2005). A magazine called *The Journalist* began in 1884 with a staff drawn largely from the New York Press Club. Although the pages of the magazine called for newswork professionalism, its main campaign was to increase pay. Newspaper publishers in 1892 founded *Newspaperdom*, a trade journal for the industry. But professional aims filled the monthly magazine *Editor and Publisher* from its founding in 1901 and may have led to its success in a period of professional aspiration among newswriters. It absorbed its main competitors (including a third trade magazine, *The Fourth Estate*) beginning in 1907. For journalists the Sigma Delta Chi fraternity began *The Quill* in 1912, and teachers founded *Journalism Quarterly* as a scholarly journal in 1924. Not all meetings led to publications. The University of Wisconsin held a newspaper conference in 1912 and the University of Kansas in 1914 to discuss the problems of journalism, for instance. But publishing tended to grow out of meetings and intertwined with the other activities typical of professionalism in newswork.

Resistance to government regulation has long been a tenet of the press (Bleyer, 1918), but journalism has received external recognition growing out of protections

for the press. The ideal of “freedom of the press” emerged by the eighteenth century in England, acquiring a limited meaning: the “freedom from licensing and nothing more” (Siebert, 1952, p. 364), which became the main definition in the North American colonies. The commercial and industrial conditions surrounding newswork seemed to threaten those ideals by the end of the nineteenth century (Salcetti, 1995). Despite their growing role in informing the public, journalists could not reap the financial rewards that other professionals could command, because newswork retained aspects of manual or factory labor and did not provide direct services to the public. Publishers mainly benefited from customs and laws growing out of the First Amendment to the US Constitution protecting freedom of speech. For practitioners the main marker of public recognition was the published byline. *The Journalist* magazine crusaded for bylines in the late nineteenth century as a way to win higher pay and status for newswork.

The other typical activity of professionalism involved the creation of a code of ethics. The Missouri Press Association developed an ethical code in the nineteenth century (Mindich, 1998; Williams, 1929), and a general discussion of ethical standards for journalism appeared in the *Atlantic Monthly* and other magazines early in the twentieth century (Bleyer, 1918; Connolly, 1902), as well as in the trade press and industry associations (Rosewater, 1903; Winship, 1904), largely in response to the yellow journalism of the era. With the urging of President Warren G. Harding the American Society of Newspaper Editors adopted a code in 1923 at its first annual meeting (Mott, 1962). Some of the norms for professional work in journalism that emerged by the early twentieth century are factual accuracy, neutrality, and objectivity. Originally defined in contrast to partisanism (Carey, 1986), objectivity is perhaps the most contested standard for professionalism in newswork (Kaplan, 2002; Mindich, 1998).

Professional norms emerged in dialogue and conflict with the relations of journalism to its sponsoring business enterprise and to its stance toward the public as an audience, although the two interrelate. Publishers like Hearst and Pulitzer were key advocates for other elements of professionalism but also pursued audiences and financial success through sensationalism, the focus on events most shocking, captivating, and perhaps base rather than on serious occurrences and political issues. H. L. Mencken was one of the few to make a virtue of the journalist’s service to publishers’ financial ends:

The newspaper must adapt its pleading to its clients’ moral limitations, just as the trial lawyer must adapt his pleading to the jury’s limitations. Neither may like the job, but both must face it to gain a larger end. And that end, I believe, is a worthy one in the newspaper’s case quite as often as in the lawyer’s, and perhaps far oftener. The art of leading the vulgar, in itself, does no discredit to its practitioner. (Mencken, 1918, p. 65)

As journalists pursued occupational independence, getting readers and making money were one side of the bargain. From the other side they could claim

professional status because of personal qualities, such as self-discipline, neutrality, and expertise as observers instead of their earlier role as partisan advocates.

The public service mission of journalism harks back to eighteenth-century arguments on whether to allow the press to cover legislative bodies. The notion of “estates of the realm” was a product of the medieval world, when the social orders divided into three realms, clergy, nobility, and commoners. The idea of newspapers as the fourth estate of the realm emerged in British parliamentary debate in 1787, attributed to Edmund Burke (Schultz, 1998). The journalist as a watchdog on the public estates may have emerged as metaphor for its public mission in the Progressive Era, when muckrakers engaged in advocacy for the reform of government and end to business wrongdoing (Bennett & Serrin, 2005). Later the Hutchins Commission on Freedom of the Press (1947) proposed a broader mission, the social responsibility to inform the public, but so broad an ideal was slow to gain acceptance among journalists. Investigative journalism of the 1960s embraced the metaphors of the fourth estate and watchdog (Osiel, 1986) and met with notable success in the Watergate era, and the ideas also spread to Latin America (Waisbord, 2000).

Consequences of Professionalism

Professional norms and role expectations are not unique to the United States (Donsbach, 1981), and critiques of journalism in countries that follow a literary tradition sometimes urge journalists to adopt the objective and denotative tradition from the US press (Broersma, 2010). But the US case matters because the peculiar combination of private media ownership and the counterbalance of newswork occupations made professionalism a central element in the media system early on, to say nothing of its influences decades later on other media systems. The US case also provides a kind of fable for what other systems might avoid (Starck & Sudhaker, 1979).

Although the learned professions acquired autonomy through their mastery of knowledge, control over who could practice, direct personal contact with clients, and other typical activities, journalists through the end of the twentieth century had more tenuous circumstances. They could not usually claim exclusive access to arcane knowledge, and most depended on news companies for employment (with notable exceptions). From early in the twentieth century their organizations claimed a vital influence on public life, but the indirect contact of individual journalists with a reading clientele gave them no easy access to independent sources of income. After more than a century of US enthusiasm for and cultural organization around professionalism (Bledstein, 1978), a debate about whether journalists are, can, or should be professional continued. The structures of work and workplace seemed to limit journalists’ professional aspirations. Once journalists accepted unions, their relationship with management embodied a labor model of occupational organization. But other groups aspiring to professionalism such as government workers formed unions at

about the same time. The industrialization of healthcare has led medicine into a similar complex overlay of expectations rooted in manual labor and “brain work.”

The practice of journalism sets up similar complexities. The structure of beat reporting follows something more akin to industry and puts journalists into direct intercourse not with the public they aim to serve but with authority figures and experts, raising suspicion about their service mission. Insider status for journalists may make them beholden to official sources, as well as making their stories reliant first on government and industry. The embedding of reporters in combat units, unlike the medical corps tradition within military branches, aims to protect reporters rather than to provide personal services to clients. The distinction highlights service but also expert knowledge, both weak components of professionalism in journalism.

Relations to audiences may also have suffered as journalism pursued professional status. As the project of professionalism advanced in the twentieth century, journalists moved further from the working classes and became more likely to hold college degrees. Their higher education and class differentiation gave them more status, an aim and byproduct of professionalism, but attenuated claims to the broadest avenues of public service. The models of *pro bono* and charity service available to the original professions even while they served primarily elites could not apply to an occupation without a general client base. The public service claims of journalism depended on appeals to advancing democracy, which lost their broad base as newswriters themselves changed. And concepts of audience were also changing, primarily from the general public of mass society to the variegated consumer markets of the late twentieth century.

In the early twentieth century, Francis E. Leupp, a long-time Washington correspondent for the *New York Evening Post*, wrote an essay for the *Atlantic Monthly* explaining the causes of “The Waning Power of the Press”: industry consolidation, the rise of cheaper outlets, specialized segmentation of knowledge, competition within the news industry, organizational imbalance between business and editorial operations, the “universal mania of hurry,” aggregating events at the expense of interpreting them, the vulnerability of news stories to the politics of owners, the exploitation of sensation and scandal, and the lack of time for journalists to read widely to inform themselves (republished in Bleyer, 1918, pp. 30–51). Each cause has its reflection in one or more aspects of professionalism. Besides the contradictions emerging from contact and conflict with competitive markets and audience tastes (or vulnerabilities), professionalism was then and is now in conflict with journalism as knowledge work in the public service. Segmented expertise gives rise to professionalism but conflicts with journalism, its hybrid bundle of tasks – the physical labor of gathering and transcribing events alongside the mental labor of interpreting patterns of events – and its social responsibility to make events intelligible to the citizenry. Leupp’s diagnosis could describe conditions facing US journalism a century later, when the easy explanation for malaise in journalism is in competitive conditions involving economics and technology for producers and audiences. But the chief issue

involves the regime of knowledge, concepts of time and space (which shifted in both eras; Kern, 2003), and the status of work.

As news media migrated to digital formats, access to publication and bylines attenuated. Anyone could publish a website or write a blog, and so journalists' status depended more on other sources, particularly their employment by a name-brand news outlet, but at the same time their employment became less secure. As audiences shrank for the media publishing in legacy formats such as newspapers and newscasts, the authority of publication alone came into question even as online publication faced skepticism. Instead of enhancing the expertise of journalists, the shift to networked computer platforms meant a deskilling of newswork along with attaching greater status to digital skills that news organizations were slow to develop themselves, leaving an opening for other kinds of knowledge workers to advance. The shifts reflect changes in conditions of knowledge under late or post modernism.

Industrial journalism brought to fruition and general circulation the early modern empiricism of Bacon, coupled with printing from moveable type and clockworks to schedule the hours of work. But it also corralled the elements Michel Foucault excavated in "disciplinary institutions": hierarchical observation and surveillance, judgment of the abnormal from the norm, pedagogy for the well-rounded citizen (of whom the journalist was an exemplar), and so forth (Foucault, 1977, p. 173). By the turn of the twenty-first century, the relation of power to knowledge had inverted, and the practices of journalism in relation to other persons, groups, institutions, and the state, especially official sources and audiences, illustrate that power is knowledge. The rise of professionalism brought communication work into conflict with other cultures around the world and with other cultural values in the United States, such as diversity (Glasser, 1992), but mostly into conflict with itself, with consequences for its fate in the twenty-first century.

The New World Information and Communication Order

An Idea That Refuses to Die

Kaarle Nordenstreng

ABSTRACT

This essay recounts the history of the movement for a new world information and communication order (NWICO) as it emerged in international arenas and particularly in UNESCO. An expression of the global movement for decolonization spearheaded by the Non-Aligned Movement, NWICO encountered strong opposition from Reagan's United States and Thatcher's Great Britain, and failed to achieve its immediate goals. It had a formative impact on the field of international communication research, and, although it has yielded to topics such as media globalization, its concerns continue to echo in the field.

This topic leads us to a particular chapter in media history, dealing with international politics as much as media studies. The concept of a “new world information and communication order,” known as NWICO, became a leading theme in global media policy debates from the 1970s until the 1990s, covering the period from heights of decolonization to the collapse of communism. The debates started in diplomatic forums of the developing countries, particularly the *Non-Aligned Movement (NAM)*,¹ and extended to professional and academic circles so that in the 1980s NWICO was part and parcel of the discourse on the media's role in society and the world at large. By the new millennium, however, it disappeared from the agenda, to be replaced by

concepts such as media globalization. In the 2010s, NWICO already belongs to the history of the field – a history that keeps re-emerging under a different aegis.

NWICO is quite a hot chapter in the history of the field. It connects the media, and the study of the media, to the geopolitical struggles between the US-led capitalist “West” and the Soviet-led socialist “East,” on the one hand, and the industrialized “North” and the developing “South,” on the other. NWICO became the buzzword for media controversies in the final period of the Cold War and in the transition to a post-Cold War world. However, NWICO did not only serve as a political context to media and their policies at the time; it was also a catalyst for paradigmatic shifts in international communication studies. The present author even compared NWICO and a critical variant of communication research as two tracks of the same movement (Nordenstreng, 1993).

In brief, the concept was born in an aggressive wave of decolonization spearheaded by NAM in the first part of the 1970s; it was consolidated during an information war, with a counterattack by the Western powers in the mid-1970s, followed by a diplomatic truce in the late 1970s; then it was shunned by another Western corporate offensive in the 1980s, and finally frozen in the turmoil of the 1990s. Yet its idea carried over to the new millennium, no longer as a pervasive concept but embedded in a number of key issues in global media policy and study.

Birth in a Decolonization Offensive

By the early 1970s, the developing countries had accumulated a great deal of political power and economic potential, with the support of such organizations as NAM and the Organization of the Petroleum Exporting Countries (OPEC). All this created a new relation of forces in the world arena, already under pressure from the socialist part of the world, leading to such manifestations as the oil crisis and the United Nations (UN) Declaration on the Establishment of a New International Economic Order (NIEO)² – all of which worked against the vested interests of the Western countries. Another corollary to this offensive against the West was a polarization of the Arab–Israeli conflict, reflected not only in a war between the parties, but also in the UN resolution by which the majority of the international community determined Zionism as a form of racism.³

In this situation, it appeared that a new chapter in world history was in the making, and it was not by chance that the phrase “new order” became popular. After all, it implies a radical analysis of the world; the concept of order points at a global structure not far from Lenin’s theory of imperialism. It suggested a radical program to change the world, which was still dominated by Western imperialism; the notion of “new” implying a call for war against the “old order.” Consequently, the basic pattern was that the West was on the defensive and the developing countries, supported by the socialist countries, were on the offensive.

Under these conditions the idea of decolonization was well established as a political program and an intellectual concept. But before 1973, it was not applied to the sphere of information and culture. This occurred systematically in NAM platforms during 1976: first in a symposium on information in Tunis, then in a conference of information ministers in New Delhi, and finally in the summit in Colombo.

The first event to articulate media and communication in terms of an international order was the NAM Symposium on Information in Tunis (Tunisia) in March 1976. The resolution of this symposium includes the following paragraph:

Since information in the world shows a disequilibrium favoring some and ignoring others, it is the duty of the non-aligned countries and the other developing countries to change this situation and obtain the decolonization of information and initiate a new international order in information. (Quoted in Nordenstreng, 1984a, p. 10)

The paragraph before this speaks about emancipation of the developing countries from “structures of imperialist power,” which should be seen in the general context of what was expressed already by the 4th NAM Summit in Algiers (Algeria) in 1973: “the activities of imperialism are not confined solely to the political and economic fields, but also cover the cultural and social fields,” demanding NAM to take “concerted action in the field of mass communication” (quoted in Nordenstreng, 1984a, p. 9).

The placing of mass communication within the structures of “imperialism” was also quite common at the time among critical scholars and development activists in the United States and Europe. Even the President of Finland – a capitalist country pursuing a neutral foreign policy between East and West – used the term when drawing attention to the structural inequalities in the media field, nationally and internationally: “Just as within Finland there is a situation in the press described as a bourgeois hegemony, on the international arena there is a state of affairs called communication imperialism” (Kekkonen, 1974, p. 44).⁴

Yet the prime mover of the NWICO concept was NAM, which followed up the Tunis symposium in July 1976 when the NAM Ministerial Meeting in New Delhi (India) established the “Press Agencies Pool of the Non-Aligned Countries” and adopted a landmark “New Delhi Declaration.” It serves as a textbook presentation of the reasoning behind NWICO:

- 1 The present global information flows are marked by a serious inadequacy and imbalance. The means of communication of information are concentrated in a few countries. The great majority of countries are reduced to being passive recipients of information which is disseminated from a few countries.
- 2 This situation perpetuates the colonial era of dependence and domination. It confines judgments and decisions on what should be known, and how it should be made known, into the hands of a few.
- 3 The dissemination of information rests at present in the hands of a few agencies located in a few developed countries, and the rest of the peoples of the world

are forced to see each other, and even themselves, through the medium of these agencies.

- 4 Just as political and economic dependence are legacies of the era of colonialism, so is the case of dependence in the field of information, which in turn retards the achievement of political and economic growth.
- 5 In a situation where the means of information are dominated and monopolized by a few, freedom of information really comes to mean freedom of these few to propagate information in the manner of their choosing and the virtual denial to the rest of the right to inform and be informed objectively and accurately.
- 6 Non-Aligned countries have, in particular, been the victims of this phenomenon. Their endeavors, individual and collective, for world peace, justice, and for the establishment of an equitable international economic order, have been underplayed or misrepresented by international news media. Their unity has sought to be eroded. Their efforts to safeguard their political and economic independence and stability have been denigrated. (Quoted in Nordenstreng, 1984a, pp. 10–11)

As pointed out by the present author (Nordenstreng, 1984b, p. 29), this declaration presents a fundamental challenge to the traditional libertarian theory of the press in three respects. First, it implies that laissez-faire will lead to monopolization and create neocolonial dependence. Second, it shows how insufficient is an abstract right to information without ensuring the material means to put that right into practice. Third, the information in the media is given explicit content qualifications: it should be objective and accurate.

The New Delhi Declaration was endorsed a month later by the 5th NAM Summit in Colombo (Sri Lanka), where 87 members of the movement – over half of the UN membership – resolved: “A new international order in the fields of information and mass communications is as vital as a new international economic order” (Nordenstreng, 1984a, p. 11). Linking NWICO with NIEO further galvanized the concept, turning it into a highly political issue in the global arena. The linkage also highlighted a powerful common denominator: the idea of collective self-reliance (Pavlic & Hamelink, 1985).⁵

The political history of decolonization would not be complete without noting that the socialist bloc of the East, although formally a separate third party of the power game, was a kind of “natural ally” of NAM as they both were directed against the West and its capitalist interests in the world. This became particularly clear in the media field, where in the early 1970s the Soviet Union had initiated a project to establish regulatory relations between international media such as news agencies and foreign broadcasts, on the one hand, to the principles of international law and professional ethics, on the other. A flagship of this project was the *Mass Media Declaration of UNESCO* which was drafted at the United Nations Educational, Scientific and Cultural Organization (UNESCO) between 1970 and 1978, with NAM and the Soviet-led East sharing the same strategic interests against the corporate-dominated West (Nordenstreng, 1984a).⁶

As far as the history of ideas is concerned, a central intellectual ingredient in the rise of NWICO was the concept of freedom – how the value-loaded idea of press freedom was suddenly brought under a critical light. Powerful input to a critical look came from Herbert Schiller's (1976) account of the genesis of the US free-flow doctrine as an instrument of cultural domination. A sharp look at the same issue from the South was provided by a veteran journalist in India, D. R. Mankekar, in books with telling titles such as *One-Way Free Flow* (1978) and *Whose Freedom? Whose Order?* (1981). A Western position was articulated by a British journalist, Rosemary Righter, in her *Whose News? Politics, the Press and the Third World* (1978). (For an overview of the free-flow doctrine in global media policy, see Nordenstreng, 2011a.)

Parallel to questioning the traditional bourgeois notion of freedom, a new concept was introduced by a liberal French media expert, Jean D'Arcy: *The Right to Communicate* (Fisher & Harms, 1983). This was an attempt to meet the intellectual and political challenge of the time, with a Western human rights bias. However, it only obtained a lukewarm reception in Western political circles, except in countries such as Sweden, which introduced the Right to Communicate into UNESCO's program in 1974. It was welcomed in the developing world as a new collective right defending cultural sovereignty. In fact, for some time it was a serious candidate for the leading intellectual idea in global media debate, but it never succeeded in achieving the same momentum as NWICO.

Consolidation in an Information War⁷

The mounting media-related activities of NAM, the UN, and UNESCO in the early 1970s gave rise to opposition in the West, particularly among private media circles. Accordingly, US newspaper publishers established the World Press Freedom Committee (WPFC)⁸ “to wage an eventually successful global struggle in and around intergovernmental organizations to beat back authoritarian proposals for a restrictive ‘new world information and communication order.’” The WPFC's first battle against UNESCO was waged at the Intergovernmental Conference on Communication Policies in Latin America and the Caribbean, held in San José (Costa Rica) in 1976. Although the moment was favorable to UNESCO's pursuit of a modestly “anti-imperialist” line, the WPFC succeeded in making the concept of a national communication policy controversial, thus impairing the momentum of this program of UNESCO.

The next battleground was UNESCO's General Conference in Nairobi in 1976, convened for the first time in Africa. The developing countries came there with the freshly articulated NAM position, and the socialist countries were prepared to push through the Mass Media Declaration as drafted by an intergovernmental meeting which failed to reach a consensus and instead voted with an East–South majority, leaving the West in a defeated minority. The Western countries and media

proprietors were most concerned in this draft about a reference to the UN resolution equating Zionism with racism and about an article suggesting that states are responsible for the activities in the international sphere of all mass media under their jurisdiction (as determined by international law).

Consequently, Nairobi became the scene of unprecedented diplomatic and non-governmental lobbying. In order to understand the events at UNESCO it is important to recall that at the same time, in 1976–1977, the US Senate Committee on Foreign Relations prepared special reports and organized hearings on global media policies, and these activities were no longer typical manifestations of the counterattack waged by lobbies such as WPFC. While certainly motivated by the same Western pro-business interests, they advocated a more flexible approach – a strategy of selective accommodation to, and active partnership with, the forces confronting the West. The mood of the day was: “Whether we like it or not, there will be a ‘New World Information Order.’”⁹

Accordingly, the information war proceeded to a new stage, after the NAM offensive and the Western counterattack – a truce. In fact, before and during Nairobi 1976 – while the Western press and private broadcasting interests kept campaigning against UNESCO – Western diplomats were busy suggesting deals to the developing countries. The political purpose was to play down the draft Mass Media Declaration, which by that time had become a symbol for the principles and contents of the mass media within an anti-Western context. By and large, the new strategy followed the old formula: If you can’t beat them, join them!

It was this situation of conflicting political strategies that led to the compromise whereby the Mass Media Declaration was shelved for another two years and the International Commission for the Study of Communication Problems was established – to be headed by Sean MacBride (MacBride et al., 1980). It was a clever tactical move by UNESCO’s Director-General Amadou-Mahtar M’Bow to set up a “reflexion group of wise men” as a way to avoid a political crisis, which had accumulated at UNESCO due to increasing disagreements about the organization’s competence to determine normative standards for the media.

The conflicting strategies of Nairobi 1976 were further elaborated by the time of the next UNESCO General Conference in Paris in 1978. An outspoken statement was given by the head of the US delegation, Ambassador John E. Reinhardt (an African American representing Jimmy Carter’s administration), who in his address contrasted “restrictive declarations” against “positive cooperation” and made a call for “American assistance, both public and private, to suitably identified regional centers of professional education and training in broadcasting and journalism in the developing world,” as well as “a major effort to apply the benefits of advanced communications technology, specifically communications satellites, to economic and social needs in the rural areas of developing nations.” There was little new in this program, but its launching at UNESCO as a kind of political demonstration gave rise to the concept of a “Marshall Plan of Telecommunications,” mooted by those developing-world representatives who were not quite convinced of the sincerity of US intentions. In

fact, this led two years later to the establishment of the *International Program for the Development of Communication (IPDC)*.

Obviously the US “carrot” was designed to play down – even to bury – the Mass Media Declaration and other manifestations of the new order. However, the fact that the Declaration was finally adopted, only three weeks after launching the “Marshall Plan,” shows that the Western strategy did not quite succeed. It did not stop the developing countries, supported by the socialist countries, from pushing “restrictive declarations.” It helped the Western side only as leverage in the bargaining process over the formulations of the Declaration. At this period of accommodation, the United States did not deploy its “stick” – for example, by threatening to withdraw from UNESCO.

Another compromise on the same US–developing countries basis was a resolution, adopted by consensus at the 1978 General Conference, concerning the MacBride Commission. This resolution appreciated the interim report which the Commission had prepared for the General Conference, and invited, among other things, the members of the Commission “to address themselves, in the course of preparing their final report, to the analysis and proposal of concrete and practical measures leading to the establishment of a more just and effective world information order.” Although this resolution did not contain explicit “free flow” references, it obviously met the Western interest in luring the developing countries to turn attention away from fundamental principles and content considerations (such as the Draft Declaration) to practical cooperation (such as the “Marshall Plan”).

Consequently, Nairobi 1976 and Paris 1978 showed that the Western counteroffensive was effective by stopping the South and East from continuing with their automatic majority. On the other hand, the developing countries and the socialist countries also obtained their part of the compromise. The Mass Media Declaration was finally adopted by consensus in November 1978.¹⁰ And the MacBride Commission was mandated to examine the problems of communication in order to get “towards a new, more just and more efficient world information and communication order,” as the subtitle of the Commission’s Report was formulated (MacBride et al. 1980). These were clearly compromises between the capitalist West, socialist East, and the Non-Aligned South of the time. There was room for compromise – a truce in an information war – in the late 1970s, largely due to the East–West détente and the oil crisis, which supported those Western strategists who preferred carrot to stick.

The next UNESCO General Conference in Belgrade in 1980 was historic, not only because it formally established the IPDC, but also because it brought together all aspects of the great debate of the 1970s, including its most controversial elements concerning the conceptual and political substance of NWICO. This took place around a resolution on the MacBride Report, delivered on that occasion. Patient and painful negotiations between and within various geopolitical groupings led to a consensus on Resolution 4/19, articulating the most elaborate definition of NWICO ever achieved in the UN system:

The General Conference considers that

- (a) this new world information and communication order could be based, among other considerations, on:
 - (i) elimination of the imbalances and inequalities which characterize the present situation;
 - (ii) elimination of the negative effects of certain monopolies, public or private, and excessive concentrations;
 - (iii) removal of the internal and external obstacles to a free flow and wider and better balanced dissemination of information and ideas;
 - (iv) plurality of sources and channels of information;
 - (v) freedom of the press and information;
 - (vi) the freedom of journalists and all professionals in the communication media, a freedom inseparable from responsibility;
 - (vii) the capacity of developing countries to achieve improvement of their own situations, notably by providing their own equipment, by training their personnel, by improving their infrastructures and by making their information and communications media suitable to their needs and aspirations;
 - (viii) the sincere will of developed countries to help them attain these objectives;
 - (ix) respect for each people's cultural identity and the right of each nation to inform the world public about its interests, its aspirations and its social and cultural values;
 - (x) respect for the right of all peoples to participate in international exchanges of information on the basis of equality, justice and mutual benefit;
 - (xi) respect for the right of the public, of ethnic and social groups and of individuals to have access to information sources and to participate actively in the communication process;
- (b) this new world information and communication order should be based on the fundamental principles of international law as laid down in the Charter of the United Nations;
- (c) diverse solutions to information and communication problems are required because social, political, cultural and economic problems differ from one country to another and, within a given country, from one group to another.

It is not difficult to see that, under paragraph (a), a great deal of diplomatic trading had resulted in favoring the Western "free flow" position. However, all of these 11 points are merely among other considerations on which the new order *could* be based. Paragraph (b), on the other hand, provides a brief but crucial statement on what the new order *should* be based. The latter endorses the general position that international law constitutes the basis for all international relations, including those in the field of journalism and mass communication. Accordingly, not only did all the member states (including the United States at the time) approve the idea of defining the new order, but its overall orientation was fixed to the UN principles of international relations. This may not appear, at first sight, as a particularly significant position, but on closer examination it is the most essential element of the whole

resolution. Paragraph (c) finally highlights that this field should respect diversity rather than uniformity – a concession to Western interests.

Accordingly, the core of NWICO is that it places the mass media within the framework of international law, as clearly pointed out by its early advocates (Masmoudi, 1979; Osolnik, 1980). In point of fact, this is not something new but rather an endorsement of a long-standing principle. Likewise, the very concept of an international order is already to be found in the 1948 Universal Declaration of Human Rights, which includes not only the celebrated Article 19 on the right to freedom of opinion and expression but also Article 28: “Everyone is entitled to a social and international order in which the rights and freedoms set forth in this Declaration can be fully realized.”

Therefore, an essential part of the NWICO substance is composed of existing instruments of international law. The first inventory of international law relating to the mass media – both their freedoms and responsibilities – was made by Hilding Eek (1979), a Swedish emeritus professor of international law. It appeared in a reader with other chapters by respected US authorities showing that the media and their freedom are indeed governed by a well-established framework of international law. It was typical, then, that there was need for inventories of relevant international instruments (Nordenstreng, Manet, & Kleinwächter, 1986; Ploman, 1982), followed by textbooks with the same approach (Hamelink, 1994).

Decline in a Corporate Offensive

The Belgrade consensus of 1980 was not long lasting. The truce in the information war of 1977–1980 was broken when the leading Western powers shifted toward a neoconservative approach. A penetrating analysis from the latter point of view was offered soon after Belgrade by Rosemary Righter (1980; quoted extensively in Nordenstreng, 1984a, pp. 57–58):

Increased state intervention in the gathering and dissemination of news will be a reality of the 1980s. A larger role for governments is implicit in the concept of a “new world information order,” already accepted in principle by all Unesco states. That role will be further developed through the formulation of government policies mobilizing the media in the service of national unity, cultural sovereignty, and political goals. News-as-instrument is coming of age.

Righter regretted the strategy of accommodation, which had placed Western countries “on the defensive, again trying to buy time.” But she saw signs that “the events at Belgrade, in the aftermath, may finally provoke Western realization that it must stop this slow erosion of the freedom of the press and of the flow of news and ideas.” And she was right, as indicated for example by *The New York Times* (May 24, 1981)

noting that “Western news organizations will no longer be perceived as fighting alone in the name of press freedom and democracy” but “they will be allied with powerful business whose interests in maintaining the status quo are unabashedly materialistic.” Moreover,

The West had failed to understand fully that the demands were part of a broad drive to increase the developing countries’ share of all resources. They seek a new economic order that would rewrite the rules of international trade and finance in their favor, the West fears. “It’s not about information. It’s about politics, high politics,” said Peter Blaker, the British Minister for United Nations affairs.

Such reactions soon escalated into a new campaign where “gloves come off in the struggle with Unesco,” as the title of *The New York Times* article reads. And this time it was a fundamental change in the Western strategy – from accommodation back to confrontation. It was a historical reappraisal, because ever since Nairobi 1976 the official Western approach, as recorded at UNESCO and the UN, remained fairly consistent until the end of 1980. This approach had been an integral part of the foreign policy of the Carter administration.

The fact that Reagan took over from Carter at this stage obviously gave encouragement to a radical change in strategy – from a flexible liberal line to a hard conservative one. A visible demonstration of the new line was in spring 1981 when 63 delegates from 21 countries gathered at the “Voices of Freedom Conference of Independent News Media” in Talloires (France), convened by the WPFC with Tufts University’s Fletcher School of Law and Diplomacy. As put by Rosemary Righter in *The Sunday Times* (May 24, 1981), “after 10 years of losing ground in this long-simmering controversy, Western governments are at last formulating a common strategy to reverse the trend towards state interference in the exchange of news and information and its content.” This meant, first, to turn attention away from a normative consideration of the content of communication and the sociopolitical objectives which the media are supposed to serve and, second, to invite the media of the developing countries to cooperate with the private sector of the industrialized West in setting up, training, and maintaining their media infrastructure and personnel. In other words, “trading ideology against cooperation,” as Righter fittingly put it.

Thus Talloires was not a frontal attack against everything put forward by the new order movement. Rather, it was an updated version of the “Marshall Plan” approach which the Western powers employed at UNESCO from 1976 to 1980. It was logical, therefore, that among the Talloires participants there were some coming from the developing countries (notably such moderates as Jamaica, Egypt, and Malaysia).

By and large, the notion of press freedom in the Talloires doctrine is virtually identical with the classic notion of free enterprise. It is natural, then, that the participants were “leaders of independent news media” – mostly owners or managers of private media enterprises and leading journalists working for them, i.e., representatives of proprietors’ interests, rather than professional journalists’ interests. This is exposed in

the Talloires Declaration, which ends: "Press freedom is a basic human right." In reality, it is the individual ("everyone") and not the media ("press") that is under international law the subject and "owner" of the "right to freedom of opinion and expression." Freedom is granted to citizens and not to institutions such as press enterprises.

The next steps in an escalating confrontation were taken within the US. House of Representatives Committee on Foreign Affairs in 1981. There the Assistant Secretary of State, Elliot Abrams, had this to say:

We oppose interpretations of a New World Information Order which seek to make governments the arbiters of media content. We oppose interpretations which seek to place blame for current communications imbalances on the policies of Western governments and media. We oppose interpretations which seek to translate biases against the free market and free press into restrictions on Western news agencies, advertisers and journalists. Attempts to justify such restrictions as a necessary adjunct of the development process are spurious. The potential can be achieved only with freedom of choice in the information field. We reject any linkage of a New World Information Order with the New International Economic Order and the radical restructuring of the international economic system which it includes.

The NWICO displayed here is an extreme "enemy image," far removed from the original NAM aspirations and the UNESCO consensus reached less than a year before. Nevertheless, the House of Representatives went along and adopted a resolution to the effect of withdrawing the US contribution to UNESCO's budget (about 25% of the total) "if that organization implements any policy or procedure the effects of which is to license journalists or their publications, to censor or otherwise restrict the free flow of information within or among countries, or to impose mandatory codes of journalistic practice or ethics." This "Beard amendment" received an unusually high level of support from the President of the United States. In a letter dated September 17, 1981, addressed to the Speaker of the House of Representatives, President Ronald Reagan wrote:

We recognize the concerns of certain developing countries regarding imbalances in the present international flow of information and ideas. But we believe that the way to resolve these concerns does not lie in silencing voices nor restricting access to the means of communication, but in encouraging a broad and rich diversity of opinion. Efforts to impose restrictions on the activities of journalists in the name of issuing licenses to "protect" them, and other restrictions of this sort that have been proposed by certain members of Unesco, are unacceptable to the United States. We strongly support – and commend to the attention of all nations – the declaration issued by independent media leaders of 21 nations at the Voices of Freedom Conference, which met at Talloires, France, in May of this year. We do not feel we can continue to support a Unesco that turns its back on the high purposes this organization was originally intended to serve.

The new Western offensive was met by the advocates of NWICO with less spectacular presentations but without any notable compromising. The NAM Intergovernmental Council for the Coordination of Information expressed "its full

support for the activities of UNESCO concerning the promotion of the New International Information Order” and by the same token, “rejected the simultaneous campaign of destabilization launched by Transnational Power Centers against the International Organization since the end of 1980, in the understanding that these global attacks by the big news agencies and corporate enterprises are truly aimed at preventing the implementation of the New International Information Order and its fundamental principles.”

The socialist countries of Eastern Europe were equally vocal in denouncing Talloires and expressing support to UNESCO. A Yugoslavian comment in *Review of International Affairs* (No. 760, 1981) called the Declaration of Talloires “at best surprising and an anachronism for these times [...] openly for the first time against the new international information order being sought by the non-aligned and developing countries and the immense majority of mankind they encompass.” Soviet reactions displayed a more dramatic picture of the “information war” declared in Talloires – with its originators “often been caught red-handed in collaboration with the CIA,” as *Moscow News* (No. 28, 1981) put it.

But it was not only the official position of NAM and the socialist countries that maintained an uncompromised view about NWICO. In addition to governments and states there were a number of non-governmental organizations (NGOs) as well as academic and professional institutions advocating NWICO. Accordingly, the Consultative Club of International and Regional Organizations of Journalists, representing hundreds of thousands of journalists from all parts of the world, also made it known that they would render broad support to NWICO. At their meeting in Baghdad in early 1982 the international and regional organizations of professional journalists stressed that, while the new order was based on respect for international law and the UN Charter, it does not mean the establishment of “government censorship” or “licensing of journalists,” as alleged by the Western campaign. A year later the Consultative Club articulated its position in a historical document, *International Principles of Professional Ethics in Journalists*.¹¹

At this stage, in 1983, UNESCO’s General Conference in Paris requested the director-general to give special attention among other activities to those “which will facilitate an in-depth analysis of the concept of a new world information and communication order, seen as an evolving and continuous process, so as to strengthen the bases upon which such an order conducive to a free flow and better balanced dissemination of information might be established.”

This compromise formulation, adopted by a consensus that included the United States, invited conceptual analysis and thus confirmed that the concept is worth pushing. On the other hand, reference to “an evolving and continuous process” implied that what was at issue is no fixed order with definite parameters but rather an overall course of development – not real action but rather reflection. In this compromise spirit a new platform was opened: the UN-UNESCO Round Table on NWICO, first convened in Igls (Austria) in September 1983 and then in Copenhagen in April 1986. It was a forum for expert discussions on the issues involved, without

high ambitions to achieve concrete results. They were quite business-like events, helping to demystify the political tensions and dogmatic positions that had accumulated around the topic. However, a third UN–UNESCO Round Table never took place as scheduled in 1987: UNESCO’s Director-General M’Bow was replaced by Federico Mayor and it became obvious that under his direction UNESCO would make a U-turn in matters of communication. Suddenly UNESCO, the earlier facilitator of NWICO debate, lost its interest in the idea and even began to suppress the debate – resorting instead to the old “free flow” approach.

The UNESCO General Conference in Sofia in 1985 no longer had the United States among the member states since it had withdrawn at the end of 1984. The US withdrawal could not be justified on the basis of the above-quoted “Beard amendment,” because there was no evidence of UNESCO restricting the free flow of information – a prelude to what happened with the weapons of mass destruction before the war in Iraq in 2003. The departure from UNESCO in 1984 was a political decision following a new strategy, as shown in the Congress hearings, and a turn away from multilateralism, i.e., from the UN platforms which followed the principle of one state, one vote. The United States simply did not care to be voted down by a majority, and its departure from UNESCO was a warning signal to the international community that it may do the same in more vital bodies of the UN.

In Sofia, a hard diplomatic struggle took place around these issues as the Western side tried to stop not only the elaboration of principles but even all studies and reflection concerning NWICO and related topics. Finally a consensus was reached (including the United Kingdom, which soon thereafter left UNESCO) which essentially preserved the line followed throughout the 1980s. Thus UNESCO would continue the “collection and analysis of information dealing with the development of the concept of a new world information and communication order, seen as an evolving and continuous process,” while “broadening the study base when necessary.” One of such activities was a symposium to review the effect of the 1978 Mass Media Declaration – an exercise coordinated by the present author between 1986 and 1988. This symposium served as a demonstration of how the tide was turning against NWICO and how the corporate offensive was getting more and more intense (Gerbner, Mowlana, & Nordenstreng, 1993, pp. 99–107).

In summary, the balance of global forces changed drastically soon after the MacBride Report was issued in 1980. Ronald Reagan’s advent as President in early 1981 turned the United States from multilateralism to a unilateral employment of power politics, with a relative weakening of the USSR and the NAM. The truce of the 1970s was followed by a new Western offensive in the 1980s. At this stage all the elements of compromise which were earlier regarded as valuable and honorable suddenly went out of fashion and even turned into liability risks. Thus M’Bow lost his job and NWICO and MacBride became taboo at UNESCO.

In a broader context of Western politics, UNESCO was regarded as a burden, whereby the Reagan administration decided that the United States would leave the organization, followed by Thatcher’s United Kingdom. Here it is important to

realize that the US and British departures from UNESCO were not caused primarily by NWICO, MacBride, or M'Bow. The true reason was a strategic shift away from multilateralism – a warning to the international community that leading Western powers would not be outvoted by the majority of the world's nations. As expressed by a former Assistant Secretary of the State of the Carter administration, UNESCO was “the Grenada of the United Nations” – referring to the US invasion of that tiny island to overthrow its Marxist government, a relatively small target to demonstrate what can be done on a larger scale if the interests of the big power are not respected.

The corporate offensive dominated the whole decade of the 1980s, but next to that were the uncompromising positions of NWICO advocates. While the concept of NWICO led its life within NAM as well as among many representative NGOs, its destiny in the intergovernmental UN forums was more compromised. Throughout the 1980s, it came under increasingly heavy pressure from Western governments, led by the Reagan and Thatcher administrations. Yet despite all the maneuvering and blackmail – including the United States and United Kingdom withdrawing from UNESCO – the concept survived until the end of the 1980s.

For Western corporate forces, NWICO was a “bad idea that refuses to die,” as the media lobbies used to say.

Freeze in Globalization and Civil Society

A new stage of the global media debate emerged in the 1990s when NWICO, including references to the MacBride Report, began to wane from intergovernmental platforms. In UNESCO, NWICO became almost a taboo, and the UN General Assembly just recognized “the call in this context for what in the United Nations and at various international forums has been termed a new world information and communication order, seen as an evolving and continuous process” (Gerbner, Mowlana, & Nordenstreng, 1993, p. xii). NAM, for its part, lost a good deal of steam when one of its central members, Yugoslavia, disintegrated and the collapse of communism brought a fundamental change to the bipolar world where NAM had entered as the third force. Nevertheless, NAM continued as an organization.

Moreover, a completely new version of the new order was introduced by President George Bush as a vision for the US strategy in the post-Cold War world and particularly in the Persian Gulf War against Iraq in early 1991. Suddenly the United States was promoting the concept of a New World Order – including an information order dominated by CNN – and the United States was not at all concerned about its “politicization” or poor definition. Even before this, Schiller and others had sarcastically observed that a new information order has in fact been established – by the transnational corporations. Indeed, we can say that by the early 1990s NWICO “came about – in reverse” (Gerbner, Mowlana, & Nordenstreng, 1993, p. xi). Cees Hamelink offers a gloomy update on this development:

The enemies of the egalitarian democratic ideal are those forces that actively shape the new world order that is currently emerging – largely in response to the collapse of Communism. The new world order poses a serious threat to the project of an egalitarian democracy since it exacerbates existing inequalities and results in a deep erosion of people's liberty to achieve self-empowerment. Since the new world order is not welcome everywhere, it also provokes a fierce opposition in forms of national, ethnic and religious fundamentalism that – ironically – equally threaten the prospect of an egalitarian democratic arrangement of world communication. (Hamelink, 1995, p. 31)

Not only did the new world order come about in reverse but also the collapse of communism caused a drastic shift: the radical as well as the reformist forces behind NWICO were overridden by emerging new corporate interests. Globalization was the universal buzzword for this stage in development of the world as well as in media debates. Globalization was a complex and controversial concept, offering media people the prospect of both threat and opportunity. (For an overview of the media and globalization debate, see Ampuja, 2012.)

In this situation some wondered whether it was time to say farewell to NWICO (Sparks & Roach, 1990), while others believed that after its rise and fall it was time for renewal (Gerbner, Mowlana, & Nordenstreng, 1993). No doubt NWICO fell down the political and academic agendas, but it was not lost. While the political context had drastically changed, the issues involved remained more or less the same. For example, the prospects opened up by a global information society and its challenge to national sovereignty did not bury but rather reinvigorated the NWICO idea. However, it was no longer called NWICO; the terminology and rhetoric were changing, but the substance mostly remained and was only complemented by new elements of technological and social development.

An important chapter in the history of NWICO was the MacBride Round Table on Communication established by a number of journalism and media related NGOs. The first Round Table was held in Harare (Zimbabwe) in October 1989 – just before the Berlin Wall fell. This was a strategic move to carry on the NWICO tradition, in the ecumenical spirit of the MacBride Commission, as a coalition of professional and academic supporters of the idea without political pressures from governments or intergovernmental organizations. The MacBride Round Table met annually throughout the decade, helping to keep NWICO on the professional and academic agenda. (For a full account of the annual MacBride Round Tables, see Vincent, Nordenstreng, & Traber, 1999.)

The MacBride Round Table was established to overcome the discontinuation of the UN–UNESCO Round Table – to ensure that the NWICO debate would be carried on – but it was also inspired by a more general idea of creating an NGO coalition as an expression of the grassroots voice and as a mobilizer of professional and citizen interests in support of NWICO. As put by the present author in the early 1990s:

In general terms, NWICO should be seen not just as high politics by governments but first and foremost as a project of what is called the citizens' organizations. Media scholars and professionals have their natural place in these constituents of civil society – more natural than among politicians and government bureaucrats.

Parallel to a shift from governments to citizens there is a new emphasis in looking at NWICO as a matter of national rather than international concern. In the beginning – in the 1970s – the causes and remedies were mostly spotted outside the Third World, typically among the Western imperialists. This global view, while still valid to a point, tends to overlook the role of national collaborators in maintaining the undesired structures. As a matter of fact, blaming imperialists is often a politically convenient way to preserve the status quo – not to do anything at home even if a lot could be done, and thus actually to work against NWICO. (Nordenstreng, 1992, pp. 40–41)

In hindsight it is obvious that there was a general trend away from governments and official political actors toward what is known as “civil society.” Sean MacBride used to point this out during his commission’s work by referring to “a change in the gravity of power” about factors influencing public opinion: from official state to unofficial civil society. By the 1990s the civil society framework was even extended to international relations – next to globalization – and the concept of global civil society emerged as a framework for studies in international communication (Nordenstreng & Schiller, 1993, p. 463).

These developments were in conformity with the idea of NWICO, but civil society was a poor party to struggle against the corporate-driven Western offensive. For example, the MacBride Round Table was hardly known among academic and professional communities, whereas the WPFC and other Western media lobbies went on with their visible campaigns – often supported by UNESCO. Moreover, the legacy of NWICO had naturally a strong element of governmental influence from NAM and the former socialist countries, reducing its intellectual attraction under the new conditions.

The subtitle above suggests that NWICO was frozen in the 1990s. Actually this is an exaggeration, and the concept did survive, especially in the academic world, as demonstrated by readers such as Golding and Harris (1997), and Bailie and Winseck (1997). However, toward the end of the decade it had a much lower profile than before – largely because it was no longer the target of such an intense political struggle. One could have expected quite the contrary – a flourishing debate once the political heat had gone. In any case it is fair to say that NWICO was offset by two winds of the 1990s: globalization and civil society. All this makes the narrative of the NWICO debate quite paradoxical.

In conclusion, we may quote Claudia Padovani’s (2008) entry on NWICO in *The International Encyclopedia of Communication*:

NWICO debates underlined the centrality of information and communication developments to societal transformation as the twenty-first century approached. Yet the global shift toward a purely market logic, the interplay between Eastern and Western superpowers, the lack of political will to address unequal information structures concretely, and the incapacity to engage a wider public in discussions, did not allow this global debate to live up to the many expectations it had raised.

Yet international communication issues have again been discussed in world forums fostered by the UN-promoted World Summit on the Information Society (WSIS, Geneva 2003 and Tunis 2005). Nonetheless a major historic silence was evident: no mention was made of previous international efforts (from the MacBride Report to the 1985 Maitland report on telecommunication policies and development priorities, promoted by the International Telecommunication Union). According to some observers (Padovani & Nordenstreng, 2005), this lack of historical depth in facing contemporary global communication challenges reflects a problematic tendency to understand them as complete novelties, thereby fostering superficial policy approaches. Much was learned through the NWICO experience that is of great relevance to contemporary world communication realities (Padovani, 2008).

Reflections and Lessons

The preceding review of the NWICO history is based on the work of the present author (see note 7) and his experiences as an actor in the process (Nordenstreng, 2011b). The narrative is largely the same in other reviews, notably that by Ulla Carlsson (2003). The overall picture of NWICO remains the same in a leading textbook on international communication (Thussu, 2006). Another textbook on global communication (McPhail, 2006) includes several passages on NWICO, but covers the topic with a Western bias as a scheme for government control – a reminder of the controversial nature of the topic.

Even if no longer actively pursued, NWICO remains an indispensable chapter in media history in general and the history of international media policy in particular. For example, in their study on media policy and globalization, Paula Chakravartty and Katharine Sarikakis (2006) name the call for NWICO history as “the most significant struggle over international communication policy in the Fordist era” (p. 30), while its demands for redistribution of communications resources and cultural sovereignty were swept aside in the post-Fordist era by “a kind of ‘reregulation’ of neoliberal governance” (p. 36). A more cynical view of NWICO is presented by Colin Sparks (2007) in his synthesizing work on globalization, development, and the mass media, where NWICO and the MacBride Commission appear in a chapter on “the failure of the imperialism paradigm” (pp. 105–125). Admittedly, Sparks has a point in placing NWICO in the second cycle of intellectual history of the field: the dominant paradigm of propagating modernity was followed by the paradigm on cultural and media imperialism as well as the paradigm of participation; after these followed the globalization paradigm. But he misses that NWICO also included elements of the participatory paradigm as part of the civil society orientation.

Several lessons can be learned from the NWICO history.

First, *NWICO was not really about media and communication but basically about “high politics.”* The determining factors boosting the concept into such a high status were

socioeconomic and geopolitical forces rather than intellectual and moral arguments. In other words, *power rather than reason* set the rules of debate. However impressive your facts, and however persuasive your arguments, you will not gain recognition in the arena of global debate unless you are backed by significant forces – and respectively opposed by significant forces. The rise of NWICO in the 1970s was facilitated by a combined force of the Second and Third World; its fall in the 1990s was likewise a consequence of their disintegration. This said, however, we have to admit that intellectual reflection does influence the course of political events. Yet, in the final instance, it is the political that determines the global agenda.

The anti-NWICO campaign itself serves as an instructive case of Orwellian double-talk: NWICO was attacked as a curb on media freedom, whereas the concept was designed to widen and deepen the freedom of information by increasing its balance and diversity on a global scale. In reality, NWICO was an idealistic instrument of diplomacy, and Third World dictators did not need it as an excuse for suppressing media. The anti-NWICO campaign was an ideologically apologetic exercise by private media proprietors, and it became effective only because of the unforeseen power with which it was waged. In this sense it is justified to call the campaign a “Big Lie.”

The second main lesson is in fact inspired by a critical assessment of the anti-NWICO campaign and its effects: *a global idea is the more durable, the more articulate its substance in public discourse*. In other words, *conceptual clarity fuels resistance* to changing political winds. It is essential, then, that a progressive idea should be articulated not only as a political slogan but as a resolution, law, or even as a scientific theory. A poorly conceptualized idea can be easily suppressed once the political forces behind it decline, whereas an idea which is grounded in in-depth analysis and is widely known to the general public is quite resilient. For example, environmental issues would have been removed long ago from the public agenda by the strong forces of finance and commerce, were it not that environmentalism was such a well-articulated field (thanks to Greenpeace, etc.).

True, these two main lessons are somewhat contradictory: One stresses politics over the intellectual, the other vice versa. Nonetheless, this is the complex and sometimes paradoxical nature of the history of important ideas. Exemplifying this, the NWICO debate provides us with a particularly paradoxical case, simultaneously containing conceptual clarity and poor intellectual elaboration. The MacBride Report itself is typical in this regard, containing at one and the same time a wealth of factually accurate description and analytically incisive distinctions of the world’s communication conditions, but also conceptually mediocre and poorly defined accounts of media reality.

The third lesson here is that NWICO’s significance lies in the debate and its lessons rather than in the actual phenomena of communication and related global structures. The whole history of NWICO offers little in terms of changing media structures and flows – except, perhaps, “in reverse” with increasing concentration, imbalance, etc. – whereas it offers a lot in terms of conceptual thinking and awareness about the role of the media and their relation to global forces.

To be sure, some media realities have changed toward the NWICO objectives. For example, alternative news and feature agencies have emerged and survived; regional and subregional centers have somewhat diversified the global patterns of one-way flow; and journalists in the North have been sensitized to appreciate foreign cultures. Or is this really so? Aren't there countertrends with ever greater ethnocentrism in "fortress Europe" and other new regional blocs? Obviously there are conflicting trends, including paradoxical developments, and hence it is hard to generalize and to be dogmatic.

Yet it is safe to say that the issues raised by the NWICO debate by and large remain valid in the contemporary world. Take the very title of the 1978 Mass Media Declaration: "concerning the Contribution of the Mass Media to Strengthening Peace and International Understanding, to the promotion of Human Rights and to Countering Racialism, Apartheid and Incitement to War." All aspects, except apartheid, are still relevant. In point of fact, the question of racism and xenophobia in the media is much more topical today than two decades ago – the Council of Europe and the European Union passing declarations with a less liberal tone than provided by the UNESCO compromise. Ethnic and religious "hate speech" as well as war propaganda are not just words in political resolutions but bitter realities around the world – not only in pockets of war and terrorism but also in the centers of the North.

Likewise, the issue of information sovereignty is far from resolved or obsolete. The difference is only that it is no longer a simple confrontation of the West with the East and the South, but today it is also a West–West confrontation, notably between the United States and Europe over TV program quotas. In general, the prospects of the "information superhighway" in the West, combined with developments in the newly liberalized East, raise pretty much the same old questions, although mostly with a new rhetoric.

NOTES

- 1 The movement of non-aligned countries started in an Asian–African conference in Bandung in 1955 and was consolidated in the first NAM summit in Belgrade in 1961, with a key role played by Presidents Sukarno of Indonesia, Nehru of India, Nkrumah of Ghana, Nasser of Egypt, and Tito of Yugoslavia. After the collapse of communism, Yugoslavia has ceased to exist, while South Africa entered as a new member, hosting the 12th summit in 1998, followed by summits in Malesia 2003 and in Cuba 2006. The 15th summit was held in Egypt 2009. See <http://www.namegypt.org/en/Pages/default.aspx>

- 4 Finland's President Urho Kekkonen addressed a symposium on the international flow of television programs held at the University of Tampere in May 1973. The materials of this symposium were used by the Tunisian hosts when preparing the NAM

symposium on information in 1996. Finland had the status of “invited guest” at NAM and thus attended the Tunis symposium as an observer, represented by the present author.

- 5 Regarding terminology, the NAM resolutions refer to “international order” whereas the UN and UNESCO resolutions later call it “world order.” Evidently, this difference does not represent a significant strategic move. However, the theory of international relations and established diplomatic phraseology suggest the word “international” although “world” may sound more elegant. Moreover, the phrase “world order” may be used as a device to dissociate the concept of new international information order from the concept of new international economic order (Nordenstreng, 1979). As to “information” and “communication,” the original NAM resolutions use the term “information,” sometimes accompanied by “mass media” or “mass communications.” Similarly, the language of international diplomacy favors “information” as a generic term referring to all kinds of media and all types of content. On the other hand, there are those – especially from the Spanish-speaking hemisphere – who consider “information” to be too limited and opposed to the democratic idea of participatory, two-way communication. Therefore the solution was to use both terms: “new international information and communication order” or, as in the 5th NAM summit document, “new international order in the fields of information and mass communications.”
- 6 This book contains a detailed account of the preparation of the declaration, including its various drafts and related debates at UNESCO. The present author had an insight into the process as a member of the Finnish delegation in an intergovernmental meeting in 1975 and as a member of a three-person negotiation group appointed by UNESCO’s director-general to prepare a compromise draft in 1977.

Text, Translation, and the End of the Unified Press

David Alan Grier

ABSTRACT

Few industries were as thoroughly transformed by computerization as the newspaper business. Computer composition and computer typesetting restructured the basic organization of the newspaper, refactored control, and encouraged the flourishing newspaper chains of the 1970s and early 1980s. However, electronic distribution radically changed the relationship between advertiser and publisher, and thereby started a decline of the traditional regional paper. As publishers adopted computer systems to manage the flow of information, they generally saw the new technology not as something that would expand the scale or scope of their work but as tools that would translate information from one form into another.

Introduction

The early computer designers, Neumann, Eckert, Mauchly, Attanasoff, Aiken, and Zuse, gave suggestion that their ideas would have application to the production and dissemination of news. During the period that marked the foundational work on computing machines, which began roughly in 1936 and extended until about 1948, they described their machines as computing devices. Konrad Zuse, who worked in

Germany at the start of World War II, was typical of the group when he wrote that his machine “serves the purpose of automatic execution by a computer of frequently recurring computations” (Zuse, 1982, p. 163). Even John von Neumann, who probably had the best grasp of the universal nature of computing, still described, in the earliest documents, computing systems that “can carry out instructions to perform calculations of considerable order of complexity” (Neumann, 1945).

All of these pioneers were building machines to solve specific scientific problems that required substantial numerical computation: the design of vacuum tubes, shock wave propagation, ballistics tables, systems of linear equations. They had little reason to speculate about potential applications of their technology beyond science and engineering. At the same time, the foundational news-gathering institution, the newspaper, was firmly identified with different technology. It was known as the Press. That title was enshrined in the US Constitution, which guaranteed the right to publish as “freedom of the press.” The newspaper had been identified with the technology of the printing press since the English Civil War of the seventeenth century, when partisans condemned their opponents for destroying printing machines. As Alexander Brome (1620–1666) wrote in the poem “June 1, 1643,” “And carefully muzzled the mouth of the press, / lest the truth should peep through their juggling dress. / For they knew a cessation would work them more harms, / Than Essex could do the cavaliers with his arms” (in Chalmers, 1810, p. 667).

When asked to assess the new computing technology, newspaper editors accepted the ideas that were offered to them by engineers and scientists. They concluded that computers were tools of national security and could be applied only to mathematical calculations. These machines, according to an early *New York Times* report, were destined for universities, military laboratories, and other organizations that might serve as “a consultation center for the research laboratories of science and industry” (Special to the *New York Times*, 1944).

As we have learned in subsequent years, computers were flexible and powerful devices that had much to offer newsgathering organizations. Step by step, they were adapted to activities that were of value to newspapers, activities that included not only the tasks of financial accounting and other numeric activities required by active businesses, but also the work of gathering, editing, printing, and distributing the stories that described the news. This process of adaptation largely involved the preparation of software that could manipulate text. To create this software, computer scientists had to develop a substantial body of knowledge that dealt with the mechanical nature of text and language. This body of knowledge was not developed in isolation. The needs of publishers informed the theories of the computer scientists just as much as the work of the computer scientists altered the operation of the newsroom.

Ultimately, computers became central features of newspapers, not replacing printing presses but changing their role in a news organization. Computers first appeared in the business offices of newspapers with software that could handle general ledgers, accounts payable, and subscription lists. They quickly advanced into

typesetting, as programmers came to appreciate the mechanical nature of the work. From there, they moved to the editorial offices with word processing systems, the library with information systems, and finally the printing room with systems that controlled presses. Ultimately, newspapers learned to use software to distribute the news and track its consumption.

In each of these different roles, software took the role of translator, transforming information from one language (or representation) into another. In this role, the software systems of news operation moved beyond the original vision of computers as automatic machines that would provide an answer that matched a given set of instructions. Instead, they became a technology to transform a human organization by isolating the tasks that transformed information and mechanizing them.

Connection to Computing History

The history of newspaper computerization inverts the commonly told story of the computer. It emphasizes the impact of certain technical developments that changed the organizational structure and operation of media companies. Those technical developments, while important to a number of industries, are only small parts of the major themes of computing history. Traditionally, the story of computation is told by the commodification of computing hardware (Ceruzzi & ebrary, 2003) and the rising complexity of software (Campbell-Kelly, 2003).

In these stories, the computer begins as a specialized tool with the construction of the ENIAC at the University of Pennsylvania in 1946. From that point, the history moves through five stages that mark the increasing complexity and standardization of computer hardware. The first of these stages, in which each computer is a unique, handcrafted instrument, lasts until roughly 1954. In the next stage, commercial manufacturers produce fixed models of computers that are generally incompatible with each other. The third stage of hardware, which marks the start of common families of computers, begins in 1964 with the announcement of the IBM 360 family of machines. This period also marks the rise of the smaller, less expensive mini computer that brought the technology to a wider audience of businesses, schools, and other applications. The fourth stage, which begins in roughly 1974, is that of the microcomputer. This era is notable less for the size and cost of computing equipment, though both shrank rapidly during this period, than for the fact that these machines were all based on a family of Intel processor chips that had a fixed instruction set and hence were capable of running common software. The fifth stage, which begins in 1992, is the age of connectivity, in which computers operate more and more in concert, sharing both data and programs.

The story of software properly starts before the invention of the computer, as it draws heavily from the ideas of production management, but it started to be the dominant story in computation after the rise of common families of computers, such

as the IBM 360, which built an environment that would encourage the commoditization of software.

Behind the growth of the software industry is another story of commoditization and standardization. It is generally seen as a response to the tight market for computer programmers that developed in the mid-1960s, an event that is often called the “programming crisis.” This market left many organizations without sufficient staff to create the software that would be necessary to support basic business tasks. The software industry addressed this crisis by allowing businesses and other organizations to purchase developed programs and hence operate with only a small programming staff. The start of this industry is generally dated to 1968, when NATO held a conference on software engineering and when IBM announced that they would no longer provide their customers with programming products without charge.

These histories of hardware and software only describe the framework of the computing age. Though these technologies brought common ideas and capabilities to the industrial landscape, they have different impacts on different organizations and for different modes of production. These changes often mirror the growth and commoditization of the underlying technology, but they are often marked by crises that occur when computing technology is sufficiently advanced and sufficiently inexpensive to be adopted by an entire industry, such as the newspaper industry.

Translating Information

For the purposes of analyzing the role of digital technology in news organizations, the computer age began in the summer of 1945, as World War II came to an end. This date falls about six months before the US government released the news of the computing machines that it developed during the war and a full year before the Moore School Lectures at the University of Pennsylvania, the summer seminars that first described the design and operation of the stored program computer (Campbell-Kelly & Williams, 1985).

During the summer of 1945, the nation’s most prominent scientist described a machine that might have some value to the nation’s newspapers. Writing in the *Atlantic Monthly*, Vannevar Bush described a machine that could store, organize, and retrieve information. Bush had led the Office of Scientific Research and Development during the war and had followed the development of electronic technology. He had designed a computing machine in the late 1920s to solve differential equations, a class of problems that were central to many fields of engineering (Bush, 1931). As the war came to an end, he started to speculate about the value of computing machines to other fields of endeavor.

“Consider a future device for individual use,” he wrote, “which is a sort of mechanized private file and library.” He viewed this machine as an “enlarged intimate supplement” to individual intelligence. It would be “a device in which an individual

stores all his books, records, and communications, and which is mechanized so that it may be consulted with exceeding speed and flexibility" (Bush, 1945). He suggested that his machine, which he called the Memex, could be built from microfilm readers, electronic circuitry, photoelectric tubes, and electric motors.

The Memex excited readers as it seemed to embody the best of scientific research. "Like Emerson's famous address of 1837 on 'The American Scholar,'" proclaimed the editor of *Atlantic Monthly*, "this paper by Dr. Bush calls for a new relationship between thinking man and the sum of our knowledge" (Bush, 1945).

In fact, the technology to build a Memex lay 40 to 50 years in the future (Simpson, Mylonas, & van Dam, 1996). More importantly, a practical Memex would require a new conception of the device. Bush conceived it as a monolithic tool like a printing press, a single machine that would dominate an organization. In that role, it came to embody the hopes and fears that the age held for computing technology. Fictionalized in the 1955 play *Desk Set* by William Marchant, it was the device that did intellectual labor and threatened to replace a staff of librarians in a mythical broadcasting network.

Academic researchers gave the Memex the more scholarly name of "Information System" and conceived of it as a repository. Though this new conception helped fit Bush's ideas into the growing field of computer science it also illustrated the limitations of the basic concept. "Strange as it may seem," wrote one researcher, "the greatest bottleneck is likely to remain for a while the initial generation, typing, and keypunching (where needed) of the incoming information" (Salton, 1966).

As a group, newspaper owners were less interested in developing new technologies for repositories than in finding tools that reduced the costs of operation or expanded the scope of their audience. The publishers of 1945 knew that the social and economic standing of their profession had been declining over the prior two decades. Advertising revenue had declined 40% during the Great Depression. Some of the advertisers had gone bankrupt in the weak economy. Others had started promoting their wares on radio stations.

Radio had expanded during the 1930s. Radio could cover a larger area than most newspapers and did not see an increase in costs when their readership expanded. Furthermore, radio could distribute breaking news quickly without all the expense of stopping the presses, rewriting and resetting the front page, and distributing a special issue (Allen, 1942).

The decline in revenue was accompanied by a decline in influence and status. In 1920, newspapers were at the height of power and influence in the United States. That year, both the Democratic and Republican parties nominated presidential candidates who were newspaper publishers: Warren G. Harding (1865–1923) of the *Marion Daily Star* and James Cox (1870–1957) of the *Dayton Daily News*. In 1945, newspapers could no longer provide for that kind of public career.

Turning to the new technologies that were being developed for the war, publishers tested devices that would improve the operations of their organizations. "Throughout the newspaper profession and the printing industry," explained one editor of the time,

“there is an alert lookout for inventions that will reduce the mechanical costs of producing and distributing newspapers” (Garnett, 1942). Over the prior decade, many papers had adopted the simple invention of a network of boys who carried papers directly to readers’ homes. “Newsstand circulation is still important in a few large cities,” explained one editor, “but even in these it is far less so than ten years ago, since the majority of today’s newspapers are delivered direct to the family doorstep” (Robb, 1942).

In general, publishers found it easier to adopt small technological improvements than to invest in a major change to their operations. For three or four years, a number of US papers had been testing a telegraph technology that allowed reporters to typeset their copy from distant locations. Since it removed the need to retype the copy in at newspaper office, it was, according to one editor, a “very important economy in both time and money” (Harrison, 1940).

Even though telegraphic typesetting appeared to give reporters direct access to the typesetting machinery, it was actually a translation technology. A small machine in the newspaper office would take the text and a few codes and prepare a line of type. It replaced a human worker who would have taken the text from the telegraph and retyped it in the house style. It simplified the process so that reporters could translate their information without knowing all the details of typesetting or even seeing the finished product. After “a very short training,” argued an editor, “they make very good telegraphic-typesetting operators” (Harrison, 1940).

The telegraphic technology was not general enough to handle all kinds of text. It was generally employed only on financial reports. However, it identified the kind of tools that would be valued by a newspaper. It required only a small investment. It replaced a skilled worker. It transformed material from one form to another. It generated a substantial return. By some accounts, it reduced costs by 70% (Harrison, 1940).

A Theory of Language

The telegraphic typesetting devices were very modest machines that accomplished their tasks with a few levers and electrical actuators. To build more sophisticated machines, especially machines that could deal with the problems of preparing and editing text, computer scientists needed to better understand textual data. “A machine for scanning and selecting printed documents would have to be able to perform a series of functions,” explained a team of researchers. “First, it would have to recognize words, phrases,” and other structure in the text. It would need the ability to identify relationships among the textual data and modify the data. “The heart of the problem is how to define tasks to be performed by the digital equipment so that the mechanized searching and selecting system will provide optimum advantages” (Perry, Berry, Luehrs, & Kent, 1954).

In the late 1940s and early 1950s, computer scientists had only vague ideas about how they could program a machine to recognize words or search a text document

or select some aspect of it. The basic theories behind this kind of work began to emerge in about 1955 as researchers began to work on the mechanical translation of one language into another. In the United States the government generously supported work to write a program that would translate Russian documents into English (Greibach, 1981).

The foundation of the new theory of translation was Noam Chomsky's analysis of the structure of language and his hierarchy of grammars. This hierarchy described a set of increasingly complex languages and showed how each set could be recognized by a certain kind of computer program. "We have seen certain indications that this approach may enable us to reduce the immense complexity of actual language to manageable proportions," he explained. It might also "provide considerable insight into the actual use and understanding of language" (Chomsky, 1956).

Chomsky's hierarchy and the other ideas of formal language became the basis not only for the translation of one human language into another but also one computer language into another. Computer scientists found this work more amenable to the theory as they could design a language to fit Chomsky's ideas rather than try to adopt Chomsky's categories to an existing human language. Many computer problems fit a formal scheme of translation, including the translation of commercial transactions into an accounting format, the translation of one database format into another, or the translation of a computer program from a language that a human could understand into one that a machine could handle.

Though the ideas of formal language theory brought new power to these problems, they did not yet replace the heuristic tools that engineers would bring to a problem. In 1957, IBM researcher John Backus largely ignored formal methods as he developed the programming language FORTRAN and the program that would translate FORTRAN into machine instructions. We "simply made up the language as we went along," he admitted (Backus, 1979).

The early computer programs for typesetting reflected more of John Backus's approach to programming than the formal theories of Chomsky. In the 1960s and 1970s, many of these programs would have to be redeveloped with more formal tools. However, the products of the 1950s proved to be useful to computer scientists as they developed the technology of editing and typesetting.

In 1963, MIT researchers worked to develop a FORTRAN program that would translate text from an IBM 709 computer to a form that would be recognized by a Photon optical typesetting machine to an IBM 709 computer. The Photon is often described as a computerized typesetter but that overstates its abilities. It was not truly programmable but used digital circuits to control an optical device that could project letters on photosensitive paper. The text for the Photon came from an operator typing at an electric keyboard. It was developed in the early 1950s and was first installed at the *Patriot Ledger* in Quincy, Massachusetts in 1956. By 1963, at least seven other newspapers used the device to set type (Neiva, 1996).

The Photon was already beginning to put pressure on newspaper organizations. Since it could be operated by a relatively unskilled typist it removed the need for

traditional typesetters, who worked with machines that cast the letters into hot lead. Ultimately, the Photon and similar machines would virtually eliminate the old typesetting jobs. (The period was 1969–1976, during which union linecasting jobs in the United States dropped from 11,557 to 1,877; Cortada, 2006, vol. 2, p. 318.) At MIT, the researchers wanted to use the device “to photocompose conventional computer results of a numerical nature,” primarily numerical tables and reports. They also saw the possibility that the Photon would allow them “to use the computer to organize verbal and other material in routine ways, for subsequent photocomposition” (Barnett, Moss, Luce, & Kelley, 1963).

In many ways, the problem of connecting the two machines was straightforward, but it provided a new insight into the nature of language and translation. Instead of translating a paragraph from Russian into English or a computer program from FORTRAN into IBM 709 machine code, this project took text that would have been destined to a computer line printer and translated it into the language that the Photon could process by adding codes for layout, font styles, and typesizes – codes that a skilled operator would normally enter at the machine’s keyboard. The MIT researchers noted that such problems “involve a mixing of data and ‘program’ in a fashion that is not so common in high speed computing.” They added that “Analogies can be sought for this mixing in other fields – stage instructions in a play, style comments and key changes in a musical score, control codes that set selectors in punched-card accounting – but very few in high speed computing” (Barnett et al., 1963).

The idea that programs contained both data and instructions was nothing new. The original documents that described stored program computers made the point that data and instructions could be indistinguishable and both could be modified by other programs (Neumann, 1945). Yet, in the early 1960s, programmers were just starting to understand the full ramifications of this idea. From this work came the idea that data did not really exist as static entities but were always connected to a program that could manipulate them.

During this period, several laboratories began to think about organizing objects that were both programs and data. The idea emerged at several different laboratories at roughly the same time. It is often connected to a group of Norwegian researchers who were trying to write programs that would simulate the actions of physical and social systems. It also appeared at a computer graphics laboratory at the University of Utah. It would eventually move to text processing. In organizing text, the actual characters and words would form the data (Kay, 1993; Holmevik, 1994). The codes that described the format would be the program.

Theory Into Practice

By the middle of the 1960s, computer scientists had developed much of the theory that they needed in order to manipulate text on a computer. Inside the computer, text was

represented as numbers but those numbers could be manipulated like the letters and words that they represented. Bell Labs had been particularly active in developing methods for manipulating text. They created a computer language, called SNOBOL, expressly for this purpose. It allowed individuals to search for text, replace it, delete it, and do other operations that are now common (Farber, Griswold, & Polonsky, 1964).

Yet, SNOBOL was a language. It was not a system that could be easily used to prepare an article, much less a full newspaper. Among the problems that it did not address was the process of translating thoughts into words, of processing the ideas of the writer. At this point, most systems accepted input only from punched cards, paper tape, or magnetic tape. IBM offered a program, called Text/360, that took input from punched cards. This method, explained the developers, “has proven to be fast, tolerant of late inputs and reliable” (Ziegler, 1969). The program took the text from cards, formatted the words to fit on a specified size of paper, and allowed the user to add commands that manipulated the original words. In general, Text/360 instructions can cause the following operations to be performed: text deleted, replaced, or inserted; text copied from one location to another; a word or phrase replaced wherever it appears (Ziegler, 1969).

Bell Labs researchers had recognized that a well-designed program for textual manipulation would interact with people in familiar ways. It would have “a typewriter as good and as simple as an ordinary secretary’s machine” that could be “located in the office of the user” (Mathews & Miller, 1965). Bell did not have that kind of facility in the mid-1960s. It required either a computer that could be devoted to a single user or a time-shared system, a large computer that serviced many people who used devices that resembled typewriters.

By 1967, text-processing programs could be found on the time-shared systems of both MIT and the University of California. “Such a program is called an editor,” explained a pair of Berkeley researchers, “and presupposes a reasonably large and powerful machine equipped with disk or drum storage” (Deutsch & Lampson, 1967). These editors worked on a teletype terminal, a keyboard that printed text on a roll of paper rather than some kind of electronic screen. They required writers to have a great deal of patience, discipline, and imagination. They had to keep a detailed picture of their text in their minds as they worked, as the program only allowed them to view small sections at a time (Kaiman, 1968). Still, such editors proved to be powerful and popular tools. They provided “more convenience than even the most elaborate keypunch can provide,” claimed the Berkeley computer scientists (Deutsch & Lampson, 1967).

During the final years of the 1960s, these editors were primarily used by computer scientists to create programs, but they were being adopted for use as publication tools. Typically, an editor would add formatting commands to the text and then feed the completed file into a program which operated much like the MIT Photon system and translated the file into a form that would produce text on the local printer. Several such systems appeared in 1967 and 1968, with MIT’s Script system being the most prominent of the group (Madnick & Moulton, 1968).

By 1968, computer scientists had been able to encapsulate that formatting skill within a program and hence free the writer from the problems of transforming words into the appropriate form. "A specialist builds a layout file for use by others," explained one developer, "and assigns to each convention a simple abbreviated notation to be inserted in the text." The system even allowed complex documents to be assembled from collections of simple texts (Kaiman, 1968).

Over the next two years, researchers moved one step further and recognized that the structure of the document was more important than its format. A number in a script font might or might not be a reference to a footnote, where as the converse, a reference to a footnote, should always be a superscript number, provided that was the style for the document. Beginning in 1969, three researchers at IBM began work on a language that would describe the structure of a document. They viewed their work as a means of organizing textual material so that it could be searched and retrieved, as it might be in an information system like Bush's Memex. "The usefulness of a retrieval program can be affected by its ability to identify the structure and purpose of the parts of text," explained the group leader. "A typesetting command language could convey such information, but present languages deal with the appearance of the text, with the purpose which motivated it" (Goldfarb, Mosher, & Peterson, 1970).

The result of their work was an idea called the Generalized Markup Language or GML. Using this language, a writer could identify sections of a document such as the title, the drop header, the author, the introduction, the conclusion, or anything similar. A database could translate this code into a form that made it easier to search through documents, a printing program could translate them into typesetting commands, and an editor could use them to modify the document.

Systems for Editing

The editorial and typesetting systems that appeared at the end of the 1960s made only limited use of the theoretical developments in textual manipulation, yet they radically changed the operation of many newspapers. Between 1969 and 1976, the industry lost 90% of its skilled typesetting workforce (Cortada, 2006, p. 318). This transformation of the workforce laid the groundwork for more sophisticated systems that would follow in subsequent decades.

Some sociologists, such as Wallace and Kalleberg (1982), have argued that the decline was not caused by the introduction of technology but by the "strongly entrenched system of job property rights in the printing industry [that] limited capitalist jurisdiction in the workplace." While an inflexible labor structure certainly contributed to the transformation of newspaper production, it was clearly a predisposing rather than an exciting cause. When publishers announced their design to replace hot metal typesetters with new phototypesetters, the unions fought the

changes and were willing to force publishers out of business rather than settle the issue on anything but their terms (Raskin, 1974). These confrontations brought strikes and labor disruptions at major newspapers, including the *Washington Post* and *New York Daily News* (News Union Warns Members Working at *Washington Post*, 1975).

For the most part, the new typesetting systems of this era were closer to the original Photon typesetter of the 1950s than the computer systems of Berkeley and MIT of the 1960s. Reporters would prepare their stories on a typewriter or elementary computer editor, they would have it punched onto paper tape, and the tape would be fed into the typesetter. By mid-decade, the most sophisticated of these machines operated like a sophisticated word processor. It would consist of a computer, a disk memory, and a keyboard that could be used for entering or editing text (Marcus & Trimble, 2006).

The individual typesetting machines of the late 1960s were soon replaced by larger, unified systems that managed the full editorial process that began with the reporter's notes and ended with a page of typeset text. These systems were built around a mini-computer, the term that the age used for a small machine that could support 10–40 users, rather than the single user serviced by an optical typesetter.

The *New York Daily News* was one of the first papers to invest in a unified system. To build the system, it contracted with the Mergenthaler Company, which was shutting its production facility for hot metal Linotype typesetters and was expanding its digital product line. Lacking much of the necessary expertise to create such a system, Mergenthaler subcontracted the task to a pair of independent computer contractors (Marcus & Trimble, 2006).

The Mergenthaler system combined the formal language theory of academic computer science in a practical system that was designed to run a newspaper. The system was divided into a set of subsystems that mimicked the traditional structure of the newsroom. Each of these subsystems kept the basic data of the newspaper in a formal description. One system kept notes and stories. Another handled classified ads. A third kept display ads. A central database handled financial information. A production system prepared pages for the printing press. Each unit could translate information from one form to another as it moved through the production process (Marcus & Trimble, 2006).

By the early 1980s, such systems were common. Many commentators remarked on how such systems changed the look of the newsroom by replacing old typewriters with cathode ray tubes. More importantly, they altered the operation of the newspaper by replacing skilled workers who helped prepare the final paper. They ended the careers of typesetters, editorial assistants, press controllers, and even copyboys, the apprentices who controlled the flow of information through the editorial office (Snyder, 1995).

By standardizing and systematizing the flow of information, these systems made it easier to disperse editorial and production activities. Writers no longer needed to work in close proximity to their editors. Printing could be moved to the suburbs,

where land was cheaper and access easier (Bergin, 2006). The *New York Times* was one of the first papers to move production out of its editorial offices. “While the *New York Times* is oriented to this great city,” explained the publisher, “we do it no service hauling 5,000 tons of newsprint a week into and out of the heart of Manhattan” (Kihss, 1975).

First Attempts at Electronic Distribution

The systems of the late 1970s and early 1980s were not yet unified systems that controlled every step of newspaper production. Most papers still relied on a skilled staff to produce a page layout and, of course, they relied on a physical network of trucks, bicycles, and delivery personnel to get the paper to the reader. However, many publishers believed that the technology of teletext might replace that delivery system. Teletext carried information on modified television signals to home receivers. A viewer could read the evening news as it scrolled up on their television (Griss, 1979).

“Skyrocketing growth in the market for new electronic systems in the home and the development of an electronic publishing industry will threaten the future growth of newspapers,” argued one trade journal in early 1980. The author saw such promise in the new technology that he predicted the closing of “some marginal newspapers,” and a decline in the number of pages in other papers. “At the very least,” he added, “the strong growth trend in newsprint demand will be brought to a halt, with the consequential grave effect on newsprint producers” (Teletext threat to newspapers, 1980).

Any enthusiasm for teletext was tempered by the fact that it was not quite a full system that would extend the production of the newsroom. It needed one more piece of software that would extract news stories from edited text, add the appropriate formatting commands for teletext, convert it to an analog signal, and send to the television transmitter. A second piece of software at the television receiver would decode the text and control the output. “We are only waiting the arrival of an economical set top teletext adaptor and an entrepreneurial type news service that wants to bring this new information medium to the American public” (Griss, 1979). The technology attracted some substantial investment, including funds from the Knight-Ridder newspaper chain for a trial of the technology in South Florida (Sterling, 2006).

Ultimately, teletext failed to gain a market and quickly vanished after the middle of the decade. Chris Sterling, a historian of communications technology, argued that the failure was initiated when the US government declined to set a single teletext standard for the country. “The result was a gridlock of rapidly declining interest,” he explained. No “sector – manufacturers, content providers, or television broadcasters – was willing (or, under American antitrust laws, able) to take the lead in coordinating choice of a national standard” (Sterling, 2006).

Digital Layout and Digital Distribution

Behind the failure to establish a standard for teletext lay a number of other problems – technical, social, and political – that no single newspaper or chain of papers was prepared to solve. Sterling (2006) identifies the traditional US rejection for government control of communication technology, the conservative strategies of the Reagan administration, and the recession that slowed the US economy in the early years of the decade. Furthermore, no US newspaper was really prepared to deal with the full consequences of electronic distribution.

If teletext had actually forced a decline in newspaper subscriptions and attracted new readers, it would have ended the primacy of the newspaper press in the media. No longer bound by that moment when the press began operation and words turned into ink, publishers would have been forced to conceive their firms as continuously gathering and producing information, a step that had yet to be taken by television news, an institution that had technology much more amenable to continuous production. Had publishers been able to deal with this issue at this time, they might have been able to make a gradual and informed transition into a new kind of news organization. When the technologies of electronic distribution matured a decade later, it was combined with the tools for electronic layout. Together, the two destroyed the unity of the newspaper.

The technology of electronic layout came first. It developed out of the idea of software objects, the idea that each of the elements of the paper – the stories, the pictures, the advertisements – could be conceived as little digital collections that contained both data and instructions. This concept became more important because of the laser printer, a device built out of the technology of the electrostatic copier. Electrostatic copiers offered the promise of a flexible printing device that would eliminate the need for the physical layout of a newspaper page. That flexibility came from the technology within the copier. These machines used a wide plastic belt to duplicate documents. The image of the document was reflected onto the belt by a bright light, a light that would destroy part of the charge and leave an electrical imprint of the original item. The machine then moved the belt through carbon dust (or toner) which would stick to the charged parts of the belt. Finally, the copier pressed the belt against a blank sheet of paper and fused the carbon to the paper with heat.

The laser printer used the same technology, except that it replaced the reflected image of a document with a laser beam that was controlled by a micro computer. That computer would take strings of text, much like the phototypesetters read paper tapes of text, turn that text into instructions for the laser, and then guide the laser to create the text on the electrostatic belt, which would eventually be transferred to paper.

This new technology of the laser printer quickly proved to be impracticable if it was used in the obvious, naïve way, the way in which the MIT researchers connected

the Photon typesetter to the IBM 709 two decades before. If a central computer would transmit a document by beginning at the upper left-hand corner and ending at the lower right, the new printers simply could not handle the flow of data and ceased to function. The solution came in the form of a new language, called PostScript, that was developed by John Warnock and Charles Geschke, who were researchers at the Xerox Palo Alto Research Center in California. The two of them adopted the idea of the programming object, the self-program that would incorporate both data and instructions, both text and the codes that would explain how the letters and words would be presented (Perry, 1988).

Warnock, who did most of the original development of PostScript, followed the pattern that had become well established in computer science. He designed his solution as an intermediate and ephemeral step of translation, as a technology that took edited text, temporarily converted it into the new language called PostScript, and transmitted it to a printer, which transformed the PostScript code into a printed document. However, in an early demonstration of this language, he was forced by circumstances to retain PostScript code and feed it to a printer at a time when the main computer was not able to operate. In the process, he recognized that by storing the PostScript code in file, he had created a translation of the document that could be processed by any computer that had his translation software. He named this version the portable document file or pdf (Grier, 2009).

PostScript, released in 1984, and pdf files, released seven years later, became key elements of an activity known as desktop publishing.¹ Though initial applications of desktop publishing concentrated on small-run publications that could be printed on laser printers or high-speed copy machines, it did nothing to displace the role of the printing press. Indeed the technology was quickly adopted by business firms for commercial purposes (Janes & Snyder, 1986). Instead, it added a key step to the electronic chain of production that began with assembling notes and ideas, moved through the writing and editing of an article, and ended with typesetting, page layout, and the printing of the final document.

Desktop publishing did not address electronic distribution, the final step that had yet to be addressed by electronic technology. This step was connected, of course, to the rise of electronic networks and involved one final step of translation. Digital works, of course, had a long history in computing technology. In 1940, Bell Labs built an electric calculator in New York City that could be operated at a distance using a special keyboard and standard telephone lines. It was demonstrated in September of that year to a meeting of the Mathematical Association of America in Hanover, New Hampshire (Andrews, 1982). In the 1950s, the US Air Force built a computer system, called SAGE, that used telephone lines to gather radar data (Ceruzzi, 1998, p. 51).

None of these early systems, nor much of the subsequent technology, provided a workable means for distributing documents electronically. Part of the reason for this, like the reason for the failure of Teletext, was the lack of a common standard for network technology. However, an equally pressing problem was the lack of a system

that would translate documents into a form that made best use of the network technology.

Standard network technology came from work done for the Advanced Research Projects Agency of the US Department of Defense (Abbate, 1999). This work, which was first demonstrated in 1969, developed the ideas of packet switching and the Internet Protocol, ideas which formed the basis for the modern Internet. The technology that would map documents into the technology of networks came from the European Research Lab CERN in 1990 and borrowed heavily from Vannevar Bush's Memex machine and the information systems of the 1950s.

"We should work toward a universal linked information system," wrote CERN scientist Tim Berners-Lee in the spring of 1990. "The aim would be to allow a place to be found for any information or reference which one felt was important, and a way of finding it afterwards." Rather than attempting to build this information system as a single machine, he designed it to be a computer network because the ideas themselves were linked like a network (Berners-Lee, 1989).

In designing this system, which became known as the World Wide Web, Berners-Lee faced one more translation problem. He would translate documents into a new language, based on the General Markup Language, that would identify the document, describe how it should be displayed, and link that document with related documents in other parts of the system. A program called a server would respond to requests by sending the appropriate document across the network. One final piece of software, called the browser, would translate the document into a form that would be properly displayed on the final computer (Berners-Lee & Connolly, 1993).

Berners-Lee did not necessarily see his creation as a general tool that could be used for commercial news as well as research documents. The debates about this technology "have sometimes tackled the problem of copyright enforcement and data security," he wrote. "These are of secondary importance at CERN, where information exchange is still more important than secrecy" (Berners-Lee, 1989). Still, his ideas quickly gained an audience beyond CERN and soon displaced competing technologies that were unable to translate documents into forms that used networks efficiently (Frana, 2004; Khare, 1999; Obraczka, Danzig, & Li, 1993).

The Consequences of Completing the Chain

Unlike the desktop publishing technology, the tools of the World Wide Web were profoundly unsettling to newspaper publishers. "What's the difference between 1990, when newspapers seemed on the verge of getting their electronic act together," asked one columnist for *Editor and Publisher*, "and 1995, when the world seems to be skittering ahead with or without them?" (Conniff, 1995). He claimed that the answer was simple: the World Wide Web. The new technology did not easily protect

copyrights. It allowed competition to enter the market with minimal capital investment. It did not support a simple subscription service.

Perhaps most fundamentally, the software systems that managed the production of news, from the reporter's notes to the completed web document, undermined the unity of the newspaper. The same software that bundled the program and data that presented the news allowed the different elements of the paper to break away from the common core and seek their fortune as independent entities.

For most of its history, the newspaper had presented itself as a unified reflection of the community it served. It would have something for everyone even though few would read the entire paper. "Today's press is a composite, omnibus vehicle carrying a variety of loads," observed one editor at the start of the computer era (Poynter, 1942). Some of those loads were more important to the journal than others. The critic Marshall McLuhan noted that the "classified ads and stock-market quotations are the bedrock of the press. Should an alternative source of easy access to such diverse daily information be found, the press will fold" (McLuhan, 1994, p. 207).

To classified ads and stock reports could be added sports news and weather reports. These elements of the newspapers attracted paying readers. They were also elements that could be isolated from the old omnibus paper and published individually provided that the cost of publication was sufficiently low. "This unbundled deployment of the multiple media that make up the guts of a newspaper is a profound development," argued *Editor and Publisher*. "For the first time, using the Web/Mosaic combination, newspapers have the chance to make universally available all the variegated pieces that go into the making of information." By the summer of 1995, at least one individual, Craig Newmark, recognized this possibility and was offering a classified ads service on the Web that he called Craigslist.

Newspapers responded to the new technology in a variety of ways. Some embraced it uncritically. Some utilized it in part. Some exerted great effort to maintain the unifying power of the printing press. Perhaps the *Washington Post* invested the greatest amount of resources in its attempt to retain control over its publication process. It decided to shun the World Wide Web technology and instead purchased a different kind of technology, called Interchange, from AT&T. Interchange was designed to be a point of entry to the Internet. Subscribers would connect to the service using a traditional phone line. At the Interchange, they would have complete access to the Internet as well as to the news of the *Post*. They called this product Digital Ink (Webb, 1995). The new service attempted to retain the unified communal presence of the newspaper. "Digital Ink aims to be the 'one-stop place to come for information,'" explained *Editor and Publisher*. "The service seems well positioned to take advantage of its promotional and advertising potential and integrates advertising with editorial, just like a newspaper" (Webb, 1995).

Digital Ink did not survive a full year of operation. Once readers had access to the World Wide Web, they had little interest in getting all of their information from a single source. They looked for services that provided more information about a narrower subject: Weather reports from a source that specialized in global weather,

classified ads from an institution that offered goods from anywhere in North America, sports stories from an organization that tracked every player on every team.

Digital Ink accepted the first customers in July 1995 and disconnected the last of them by June the following year. Over the intervening 12 months, no more than 11,000 individuals accessed the paper. In the first days of a new service, Washingtonpost.com, which was built with World Wide Web technology, a million people looked at the new site. "It's easy to condemn it and we all do. But everyone else made a lot of the same mistakes," explained one of the managers of Digital Ink. "The Web happened. And messed up a lot of people" (Mark Potts, quoted in Jenkins, 1996).

The Transformed Newspaper

In his study *The Digital Hand*, historian Jim Cortada (2006) argues that digital technology "came initially to newspapers for the same reason as to so many other industries: to drive down the costs of labor and thereby improve productivity" (p. 315). His approach helps us understand the pattern the US industry followed when it adopted computer production technology and the development of that technology itself, but it does not quite illustrate the role of the production process within newspapers, nor does it explain the central role of the printing press in the dissemination of newspapers.

In 1995, just as the *Washington Post* and other papers were developing their web pages, the head of the MIT media laboratory, Nicholas Negroponte, argued that the "medium is not the message in a digital world." He dismissed the famous phrase of Marshall McLuhan by arguing that messages were now freely translatable from one format to another, that a "message might have several embodiments automatically derivable from the same data" and hence are not trapped in a single media (Negroponte, 1995, p. 71).

Yet McLuhan's point remains valid without undermining the claim of Negroponte. The kind of printing press that one needed to publish a daily paper influenced the nature of the production process and, ultimately, the messages carried by the product. A press is an expensive capital good that needs to be kept in operation and yet be connected to the daily cycle of life in a community. The "dateline is the only organizing principle of the newspaper image of the community," McLuhan argued. "Take off the dateline and one day's paper is the same as the next" (McLuhan, 1994, p. 212).

While the printing press was central to the production of a daily paper, it was not replaced in a moment. Indeed, newspaper publishers introduced technology to improve the process rather than make a major change. Digital systems appeared, step by step, as technologies of translation, programs that would take a message from one form and change it into another. Beginning with telegraphic typesetting, these systems translated text from one form to another and, step by step, it built a chain of production that prepared and developed the news.

In 1996, following the demise of Digital Ink, the newspaper technology began to move beyond the printing press. That summer, the trade publication *Editor and Publisher* surveyed the nation's newspapers and concluded that well over 90% of them had established a presence on the World Wide Web (Jenkins, 1996). Unlike previous efforts to introduce digital technology into the production of news, this last step was not driven by a desire to reduce costs but rather by concerns to establish a place in the growing market that was supported by the networks. "Most online newspapers have yet to turn a profit," explained a US government report that year, "but they remain committed to the Internet" (Margherio, 1998, pp. A4–5).

"While there is some concern over the acceptability of the newspaper in electronic versus paper form, the electronic form appears to be inevitable," argued researchers who were studying the methods of disseminating printing in the middle of the 1990s. "However, the newspaper metaphor is likely to be only the initial interface as the paradigm continues to evolve" (Burkowski, Shepherd, & Watters, 1994).

The metaphor of the newspaper, the idea of a news organization that was rooted in the community, centered on an expensive printing press, and driven by the daily cycles of life has been surprisingly slow to evolve. Long after computer software collapsed the news cycle into instantaneous postings and stretched their community to embrace the globe, they still clung to policies that were developed for an organization that evolved into new forms. Most news organizations require reporters to use the byline of their physical location, even though that location may have nothing to do with the story that they are writing.

One news organization required a reporter to spend the night of January 19, 2009 in a rented apartment so that he could use a Washington, DC byline for his story on the inauguration of Barack Obama. He had no way to see the inauguration except on television, no way to gather information except by telephone and email, no way to file except over the Internet. His relationship to the processes that created the news and those that produced the paper were unaffected by his physical location. This news organization had completely abandoned its newspaper press and cast its lot with digital publication. Its organization was no longer driven by deadlines imposed by a physical press but by a system that gathered information from around the globe, translated it from one form to another, combined its stories with advertising, and distributed the final product to all who wanted it. This system was built upon four decades of research into the best methods of manipulating text and graphics. Yet, this system had failed to transform the basic assumption that reporters can only write about the countries, the cities, the neighborhoods in which they actually reside (Grier, 2009).

NOTE

- 1 Desktop publishing is usually dated to a string of articles that appeared in business magazines in the spring of 1986. For example, *PC World* ran a series of articles on the subject that spring. See Desktop publishing (1986).

Media and Mobility

Mark Andrejevic

ABSTRACT

This chapter explores the changing relationship of mobility to media technology, considering the ways in which we think about, engage in, and exploit the mobility of people and devices, goods and services, in a world in which mobility serves as an increasingly important type of information and information goes increasingly mobile. The chapter rethinks the ways in which information mobility and physical mobility interact with one another in the transition from industrial era shifts to digital era developments. If mobility has, at times, claimed for itself the attributes of a certain kind of freedom, this chapter considers the way in which this freedom can be put to work. The conquest of space, in the digital era, refers to the creation of a ubiquitous electromagnetic atmosphere – not merely extension across space, but also a “filling-in” of space, so that wherever one goes, the network can be accessed, information can be retrieved, and feedback generated. Information is generated not simply about the movement of objects, but about the movement of messages, and, recursively, the tracking of the movement of messages. Mobility, in this sense, participates in a productive spiral.

Writing in the waning years of the Space Race, James Carey (1992) located the rise of the electronic computer in a sequential chain of relationships between media and transportation: “As printing went with seagoing navigation and the telegraph with the railway, electronic and computer-based communication go with the space ship” (p. 171). Despite its element of truth – space ships rely on a variety of computerized systems – the observation is of a piece with its historical period, a more ballistic time when space travel and rockets captured the technological imaginary.¹ Space has since given way to other final frontiers and the contemporary technological imagination is less caught up in the *Popular Science*, sci-fi imagery of *The Jetsons*, *Star Trek*, and other space odysseys than in the *Wired* techno-futurism of the information revolution. In this regard the attempt to make a grand equation between a new communication technology and a new form of transportation falls short. Electronic communication has arguably advanced much further than space travel in the intervening years. It is perhaps telling that, as of this writing, NASA’s budget has dropped to about one-half of 1% of the US federal budget from a high of more than 5% of the budget in the mid-1960s: a decline of one order of magnitude. The agency’s budget remains a fraction of the annual revenues of any one of a number of major information and communication technology companies, including Apple, Google, and AT&T, and only a tiny fraction of the whole sector. Space travel itself remains on the budgetary back burner, with occasional fleeting flare-ups about possible expeditions to Mars. Given the role it plays in satellite communication, space – or at least the orbital realm – has become more infrastructure than frontier.

Perhaps this is because space travel, unlike both of the earlier transportation technologies invoked by Carey – shipping and the railway – has not yet become integrally tied to the development of commerce. Despite the efforts of various entrepreneurs, transportation and exploration via “space ship” remain the province of mostly state-funded research and have yet to play a crucial role in the provision and sale of goods and services. The shift in the technological imaginary from the realm of rockets and jetpacks to that of Blackberries and iPads, however, does not undermine Carey’s deeper insight of the connection between technologies of communication and transportation. At the most basic level, the very notion of a medium implies the movement of a message through space and time, and, as a corollary, the spatial relations between communicators and messages. Thus, as Carey famously notes, for much of human history transportation and communication were identified with one another because messages traveled alongside people and things. The history of communication and that of human mobility, whether in the form of exploration, migration, or colonization, is tied up with that of communication. This connection is, as Carey notes, central to the pioneering work of Canadian communication scholar Harold Innis, for whom “communication, when considered in terms of the medium that facilitated it, might be seen as the basic staple in the growth of empire” (Carey, 1992, p. 157). To situate communication at the heart of empire is to foreground the relationship between mobility and control. Beniger (1986) further develops this connection in his study of the role played by communication technolo-

gies, broadly construed, in managing the “crises” of control associated with industrialization and the development of more rapid forms of production and distribution in the modern nation-state:

Although transportation and telecommunications infrastructures have also played crucial roles in the control of large territories since the Roman Empire, it is difficult to imagine consolidation of the modern nation state, over the nineteenth and early twentieth centuries, without the cultural integration made possible by parallel development of the first truly mass media: lithographic reproduction (1820s), photography and power printing (1830s), cheaper wood pulp publications (1850s), transatlantic telegraphic news reporting (1860s), illustrated daily newspapers and mass mailing (1870s), halftone photoreproduction (1880s), and finally broadcasting (1900s). (Beniger, 1986, p. 301)

Similarly, for Anderson (1983), communication and mobility have a combined role to play in the formation of the nation as an imagined community – a spatially dispersed, but shared notion of national community traveling, as it were, through time. Mass circulation media contributed to this shared sense of community, not least because people reading a daily newspaper could imagine themselves as part of a national audience they could not see in its entirety, but whose traces were discernable in daily life: “At the same time the newspaper reader, observing exact replicas of his own paper being consumed by his subway, barbershop, or residential neighbors, is continually reassured that the imagined world is visibly rooted in everyday life” (Anderson, 1983, p. 35).

The Relevance of Geography

These accounts share a preoccupation with the logic of control – an interest in the way communication helps reproduce social processes over time and space: “So central is communication to the process of control that the two have become the joint subject of the modern science of cybernetics, defined by one of its founders as ‘the entire field of control and communication theory, whether in the machine or in the animal’” (Beniger, 1986, p. 22; the reference is to Wiener, 1948, p. 11). Two of the main challenges posed to control – and thus to communication – are those of speed and distance: the ability to keep up with the expansion of social systems across territory and to monitor and manage social activity as it unfolds in time. The development of electronic communication technologies, which as Carey (1986) famously noted, break the identity of transportation and communication, addresses both of these challenges. Thanks to the speed of electromagnetic signals, these technologies allow for the coordination of distant activities – for the expansion of a societal “body” across space. As Carey (1986) put it, the communication technology functioned as, “in the favorite metaphor of the day [. . .] a thoroughly encephalated social nervous

system in which signaling was divorced from musculature” (p. 215). Electronic communication technologies developed as a means of managing the “crisis of control” brought about by the acceleration of production and transport in the industrial era: the threat that the “musculature” might outstrip the systems for managing and controlling it: “Never before had the processing of material flows threatened to exceed, in both volume and speed, the capacity of technology to contain them” (p. 12). If information was going to help coordinate such processes, it would have to travel faster than the objects being controlled.

Thus, as Carey (1986) puts it, “The great theoretical significance” of the telegraph, “lay not merely in the separation [of transportation from communication] but also in the use of the telegraph as both a model of and a mechanism for control of the physical movement of things, specifically for the railroad [. . .] not only can information move independently of and faster than physical entities, but it also can be a simulation of and control mechanism for what has been left behind” (p. 215). The result, Carey argues, is the evening out of geographical difference – the differences that used to take *time* to cover. Geography made a difference that appeared in the register of time (at least for the purposes of market signaling that Carey discusses). A technology that allowed messages to cover time almost instantaneously had the effect of obliterating these spatiotemporal differences. Thanks to the development of electronic communication technologies, dispatchers could keep track of trains remotely just as stock traders across the country could track market prices in New York City. Geographic distance no longer mattered in the same way: “The telegraph puts everyone in the same place for purposes of trade; it makes geography irrelevant” (Carey, 1986, p. 217).

The newly achieved irrelevance of geography, Carey argues, opened up the speculative frontier of the future: space-based arbitrage (capitalizing on the difference between the prices of commodities in different locations) was replaced by futures trading. If time no longer served as a proxy for the differences associated with distance it could still project difference into the future. The notion of frontiers other than the spatial – than (outer) space itself – seems a more productive alternative to the chain of associations in which the telegraph gives us the coordinated rail system and the computer yields space travel. Carey himself provides an alternative to this formulation with the following observation (drawing on Melbin, 1987): “The notion of night as frontier, a new frontier of time that opens once space is filled is a metaphor, but it is more than that” (Carey, 1986, p. 228). He is referring here to the colonization of new times by commercial broadcasting: the long march of programming into the night. Since the time of his writing, we might expand this notion of new frontiers to include the colonization of new spatial “frontiers” by advertising and commercial media, whether these be the roofs of taxi cabs, the walls of elevators or health clubs, or the Web pages that we visit to access our email and search the Internet. Developments in the expansion of these new frontiers, both spatial and temporal, complement one another: increasing the time of exposure to commercially supported content and advertising requires reaching people in new locations. Exploiting new times means capturing new spaces.

If the telegraph signaled the moment when the identity between communication and transportation was broken, networked computing marks a form of reconciliation: communication can take place wherever we go.

From the perspective of commerce, this development marks a recovered relevance for geography. The goal of so-called contextual advertising on mobile devices including laptops and mobile phones, for example, is to be able to deliver marketing appeals in real time with geographic salience. To paraphrase Carey, the network puts everyone in their own place for purposes of consumption. If the telegraph separated communication from transportation in order to allow the former to manage the latter, the network, in a sense, makes communication reflexive: it provides information about where and when communication is taking place, and in so doing reintroduces the commercial relevance of geography. If Carey (1986) notes the impact of the telegraph as a homogenizing one that facilitates the “spread of a uniform price system throughout space so that for the purposes of trade everyone is in the same place” (p. 222), networked computing envisions the customization of pricing so that, for example, someone purchasing a Coke on a hot day from a vending machine in Arizona might have to pay a higher price than someone using a similar machine on a chilly day in Maine (Boyes & Melvin, 2009, p. 89). The mobility of information piggybacks on the movement of people in a productive spiral.

Biased Media

To speak of mobility within the context of media technologies and practices is to consider the circulation and control of both people and information, populations and messages. To return, once again, to the example of space travel, all of these concerns are embedded in Carey’s (1992) observation that “the delays in space exploration did not derive from deficiencies of rocket thrust. The real delay was the development of a system of communication that would allow space travel to be controlled from earth” (p. 171). The issue is not whether humans can be launched into space, but whether that can be done in a way that allows a society or culture to advance into this same space: that is, to maintain contact with the space travelers, to enfold them (even at a distance) within the embrace of the society that sent them off, and, finally, to incorporate the fruits of exploration into this society that originated it. By the same token, according to Carey (1992), “It was print and navigation that allowed European nations to burst the bonds of geography and spread into a ‘new world’” (p. 158). Mobility and communication go hand-in-hand to reproduce cultural and economic systems across space. The development of technologies for transportation and production goes hand-in-hand with that of communication technologies and practices: “Each new technological innovation extends the processes that sustain life, thereby increasing the need for control and hence for improved control technology” (Beniger, 2007, p. 310).

Control, in this context, need not refer to a particular type of top-down or authoritarian power, but rather to the effective management of social relations and, consequently, the process of social reproduction. Innis (1950, 1951) argued that communication systems can be characterized according to their varying abilities to manage culture across space and over time. His analysis invites us to think about the material characteristics of media technologies: are they “light” and portable enough to allow standardized transmission across space? Are they durable and compelling enough to reproduce their messages over time? Imperial expansion relies upon communication practices that allow for accurate accounting for and management of far-flung bureaucratic systems; its durability depends upon practices that foster a commitment to the reproduction of social relations over time. For Innis, the rhythm of the rise and fall of empires and spheres of influence corresponds to various shifts in the warp and woof of time and space management: the ability to convey control across space and to reproduce social relations and the systems of knowledge and practice that sustain them over time. Thus, for example, his account of Egypt’s middle kingdom traces shifts that undermine control over space:

A decline of centralized bureaucratic power and a shift from an emphasis on control over space reflected in the pyramid to a decentralized bureaucratic power with an emphasis on continuity and religion to be seen in the spread of writing and the use of papyrus, the extension of magical formulae from the hieroglyphic of the pyramids to that of papyrus, from the king to the people weakened control over space [. . .] (Innis, 1950, p. 95).

The interplay of control over space and time corresponds, for Innis, to the interplay of media technologies and their abilities to facilitate one form of control or the other: “Concentration on a medium of communication implies a bias in the cultural development of the civilization concerned either toward an emphasis on space and political organization or toward an emphasis on time and religious organization. Introduction of a second medium tends to check the bias of the first and to create conditions suited to the growth of empire” (Innis, 1950, p. 216). The balance is disturbed when the dominant tendency of a particular medium goes unchecked – as in the case of the bias of electronic media toward instrumental reason, abstraction, and bureaucratic administration. For Innis, the character of a society is, to an important extent, shaped by the characteristics of the dominant media practices and technologies. As Carey (1986) puts it, “In propositional form, then, structures of consciousness parallel structures of communication” (p. 161).

But Innis’s account is also a critical one: an emphasis on the binding of space via the high-speed transmission of messages across long distances, and the consequent development of technical communication associated with the management of economic relations at a distance, tilt the balance toward the political and bureaucratic. There is a narrative of decline embedded in Innis’s description of the eclipse of concerns of time by those of space: “Innis characterized modern Western

history as beginning with temporal organization and ending with spatial organization. It is the history of the evaporation of an oral and manuscript tradition and the concerns of community, morals, and metaphysics and their replacement by print and electronics supporting a bias toward space" (Carey, 1992, p. 160). There is a familiar critique of mobility at work in this narrative of decline: not just a loss of rootedness or grounding, but a concern with the homogenization and instrumentalization of space that has come to characterize contemporary critiques of capitalist globalization. Accounts of the culmination of what Marx (writing in the era of the telegraph) described as "the annihilation of space by time" invoke a sense of loss: not only of the distinctness of geographic difference, but of the time for reflection associated with difference. As Paul Virilio puts it, "We're heading towards a situation in which every city will be in the same place in time. There will be a kind of coexistence, and probably not a very peaceful one, between these cities which have kept their distance in space, but which will be telescoped in time" (as quoted in Armitage, 2000, p. 11).

The ambiguity in these accounts – is it space that is annihilated (and temporal distance preserved) or time that is telescoped (while distance is maintained) – is structural: the goal of instant communication across space is the elimination of temporal difference and delay. The rapid transit of messaging across space is associated with a collapse of the future into the present: a process of simulation incorporates the anticipation of future markets into current transactions. Consider, for example, the spread of futures markets or so-called decision markets from the realm of finance to those of politics, medicine, national defense, and even meteorology. There is nothing new about speculation *per se*, but the migration of so-called decision markets into the realm of policymaking marks an attempt to telescope time – to translate the future into the present for the purpose of governance. In this regard, the so-called War on Terror with its goal of comprehensive, *preemptive* monitoring of the flows of people, capital, and information, marks the logic of warfare in an era of so-called "time-space compression" (Massey, 1994, p. 22). Victory in such a war cannot be defined after the fact, as in the case of the movement of troops on a battlefield, but only in terms of comprehensive preemption.

In each of these spheres, standardization and interoperability render the control and signaling process effective and comprehensive. As Douglas (1997) puts it, "The importance of not only predicting the future, but attempting to shape it, necessitates a greater form of synchronicity between the levels of society, institution, or firm" (p. 167). Globalization, to continue along the tracks of Carey's train of thought, is attendant upon the development of a communication system that allows for the comprehensive management of global mobility: of messages, people, things, and capital that not only move through coordinated interactive networks, but generate information about themselves as they go. This redoubling of mobility is at the heart of the productivity of the information society and contributes to a de-differentiation of communication and transportation: mobility becomes a form of communication; motion, as it were, expresses itself.

Rhythms of Mobility

Mobility is not necessarily always aligned with productivity. What Beniger (1986) describes as the “Neolithic revolution,” which was characterized by the first permanent settlements, countered the mobility of nomadic life with the productivity of animal husbandry and agriculture. Fixed settlements coincided with production technologies that could generate a surplus thanks to “the refinement of stone tools and the domestication of plants and animals” (Beniger, 2007, p. 302). If such settlements relied on the time-binding character of the oral tradition, over time this was supplemented by forms of representation and communication of the “heavy and durable” type Innis (1950) associates with the bias of time: clay and stone tablets, architecture, the pyramids, and so on. As forms of fixed settlement prosper, they tend to expand. Prosperity combined with the development of transportation technology ranging from the construction of roads to the development of navigation techniques come to underwrite trade and cultural expansion and hence the need for portable, “lighter” forms of communication. Lightness does not simply refer to weight, but to ease of transport and accessibility. In the end the operative distinction for Innis is not simply a material one between, say, heavy clay tablets on the one hand and portable forms of papyrus on the other, but also a sensory one between the ear and the eye: between those forms of communication that rely upon and are conducive to rituals of personal communion and those that facilitate abstracted forms of long-distance management and control. Thus radio – what Ong (1988) describes as a form of secondary orality – finds itself on the side of the technocracy, not necessarily because it is fleeting and evanescent, but because, like the printing press, it addresses “the world instead of the individual” (Innis, 1950, p. 190).² Innis’s own bias was toward the oral and the ecclesiastical, with their role in the development and enrichment of culture over time: “The oral discussion inherently involves personal contact and a consideration for the feelings of others, and it is in sharp contrast with the cruelty of mechanized communication and the tendencies which we have come to note in the modern world” (Innis, 1950, p. 191).

It seems fair to say that if the history prior to the arrival of the printing press in Europe is characterized by an ongoing tension between media of space and media of time, between the expansion of empire and the durability of the ecclesiastical, the advent of print capitalism creates the fundamental imbalance that leads to Innis’s indictment of Western civilization. Developments in navigation and shipping associated with “The Commercial Revolution, following exploration of Africa, Asia, and the New World” (Beniger, 2007, p. 303) combined with the emergence of a medium for the mass production of print to set the stage for a shift to productivity of mobility and the management of space. For Innis (1950), “The discovery of printing in the middle of the fifteenth century implied the beginning of a return to a type of civilization dominated by the eye rather than the ear” (p. 138).

With the rise of mercantile capitalism and eventually industrialization, the circulation of people and goods came both to depend on and to facilitate the circulation of information enabled by technological developments in transportation and manufacture: “The Industrial Revolution followed the printing industry and in turn in the nineteenth century, with the use of steam power in the manufacture of paper and of printed material, supported rapid expansion of the printing industry” (Innis, 1950, p. 139). Douglas (1997) notes that Mumford traces the emergence of a “new era of generalized mobility” back to the sixteenth century: “The ‘new spirit of society,’ he argues, ‘was on the side of rapid transportation [. . . t]he hastening of movement and the conquest of space [. . .] Mass, velocity, and time were categories of social effort before Newton’s law was formulated’” (p. 168). For Mumford, capital, in the form of money, can be firmly located on the side of “lightness”:

as the emphasis upon money grew in part out of the increasing mobility of late medieval society, with its international trade, so did the resulting money economy promote more trade: landed wealth, humanized wealth, houses, paintings, sculptures, books, even gold itself were all relatively difficult to transport, whereas money could be transported after pronouncing the proper abracadabra by a simple algebraic operation on one side or another of the ledger. (Mumford, 1963, p. 24)

Capitalism in its various forms relied not just on improved technologies for the transport of raw materials and finished products but also on mobility of people associated with colonization and internal and external migration. For Innis (1950), the result was a kind of permanent if productive imbalance: “Constant changes in technology particularly as they affect communication [. . .] increase the difficulties of recognizing balance let alone achieving it” (p. 140). For Beniger (1986), the result was a series of crises of control that helped drive the development of increasingly efficient forms of communication and feedback-based management. Whereas Beniger (1986) paints a portrait of a rhythm of crisis and control, Innis’s picture of constant imbalance is perhaps more compelling: new technology facilitates increased speeds of production, circulation, and consumption leading to perpetual crisis and breathless acceleration. Computers not only monitor the movements of people, commodities, and capital, but also facilitate their increasingly rapid circulation. As Douglas (1997) notes, control of movement gives way to speed – and acceleration: “The difference is but one of degree: in *late* modernity the ‘problem of movement’ is substituted for what Paul Virilio has termed the ‘movement of movement’ (speed)” (p. 170) and hence, the capture and monitoring of movement.

Mocio-Economics

If the logical endpoint of acceleration is instantaneity, this is not quite the same thing as stasis or the obliteration of location and the consequent irrelevance of geography.

Once upon a time, the vision of stasis was a wired fantasy of the futurists: that the network could virtualize mobility, rendering its physical counterpart a matter of choice. Taken to its limit, telecommuting would be subsumed to so-called “virtual workspaces” (Pruitt & Barrett, 1991) – virtual reality suits that would allow us to roam the world and interact with others without leaving the privacy of home. This was seen as a “green” development: pollution and costs could both be reduced by replacing physical transportation with virtual mobility: commuting would be replaced by telecommuting, conferencing by tele-conferencing, education by distance learning, and so on.

The disappearance of personal contact (at least in its face-to-face version) associated by Innis with space-biased media is taken to an extreme. Aside from the somewhat alienating vision of a world in which mobility is virtualized, the prospect of a trade-off between virtual and physical mobility runs counter to the productive logic of mobility. The compression of space enabled by new transportation and communication technologies corresponded to dramatic increases in its consumption as travel became a consumer good. At the start of the twenty-first century the US National Academy of Engineering praised the dramatic increase in the mobility of the nation’s population as one of the greatest achievements of the previous century: “In 1900 the average American traveled about 1,200 miles in a lifetime, mostly on foot, and mostly within his or her own village or town. By the end of the century, the typical American adult would travel some 12,000 miles by automobile alone, in just one year” (National Academy of Engineering, 2000).

This dramatic increase reflected a feat of production engineering – of highway building and automobile making, of designing and constructing the infrastructure for suburban sprawl and shopping malls – but it also represented a crucial spatial component of the dramatic increase in levels of consumption and production associated with twentieth-century consumer society. What Lefebvre (1991) described as the “productive consumption” of space associated with increased mobility helped to stimulate a productive spiral: suburbanization and its associated technologies of mobile and static privatization increased demand through spatial dispersion. Each household served as the repository for a private set of appliances that displaced or replaced forms of collective consumption: the automobile displaced the trolley, the radio the concert hall, the TV set the downtown movie theater, and so on. Eventually these personalized media would go mobile, in the form of the transistor radio, the car VCR, and eventually, the mobile phone, the laptop computer, the iPad, and so on. The disaggregation and individualization of consumption, communication, and transport helped to absorb the goods produced by an increasingly rationalized and efficient industrial sector. The close connection between individualized media devices and transport is indicative: communication technologies piggyback on the productive spiral of the consumption of space. As mobility becomes coupled with communication, the combination of portability and functionality generates a proliferation of media commodities and devices: LPs give way to cassettes and then to CDs, mini-disks, and eventually MP3 players (at which point the commodity

becomes so mobile that its status as a commodity is threatened). This progression is paralleled by the development of car radios, 8-track tape players, cassette decks, and iPod ports.

The sheer number of devices – many of them portable and individualized – associated with media consumption in the new millennium dwarfs the technological range of devices available only a generation earlier. Whereas a middle-class family a few decades ago might have kept the same phone for 15 or 20 years, these days the half-life of a mobile phone is only a matter of a few months. The same household may have had only one or two extensions for the whole family, rather than one (or more) mobile phones per person. The same might be said of computers, which are typically upgraded every few years and are becoming increasingly individualized as they become more compact and portable. The advent of so-called cloud computing means that laptops are becoming tethered by the Internet to ever-evolving applications that require constant updates and hardware upgrades. Our relation to what once might have been considered consumer “durables” takes on the character of a flow: an accelerated rhythm of upgrading, consuming, and discarding.

The multiplication of personal devices enlists the industrial-era promise of individuation as redress from (and ruse for) rationalization. Suburbanization offered an escape from urban congestion as surely as it served as a form of sorting, exclusion, and differentiation. Similarly, the interstate highway system mobilized the myth of the freedom of the road while simultaneously channeling movement through certain areas and around others. As Deleuze put it, “People can drive infinitely and ‘freely’ without being confined yet while still being perfectly controlled” (quoted in Allon, 2001, p. 20). From the very inception of mass society, the promise of differentiation, of freedom – in short, of an escape from its own stultifying homogeneity – has served as one of its guiding marketing strategies (Marchand, 1986).

As media critics have argued (including Barney, 2000; Robins & Webster, 1999), the so-called revolutionary promise of new interactive media represents not a radical departure from this strategy but an extension of its logic. The development of so-called “m-commerce” continues the strategy of mobility based differentiation, specification, and customization. Short for “mobile commerce,” the term has been championed by the publicists of the wireless Internet, and the range of mobile, interactive, networked devices it enables. The prospect of data-driven mass customization based on continuous, real-time monitoring of consumers continues to be held out as one of the potential killer applications of wireless, portable media and is being pursued by m-commerce entrepreneurs and social networking sites. The metaphor align left cyberspace has, in this regard, come full circle. Thanks to portable, interactive devices, one can leave one’s home without leaving the flexible, interactive, and customized world of cyberspace. To the extent that the elastic boundaries of cyberspace stretch beyond the confines of the home or office to contain the physical motion of the mobile consumer, this motion becomes the real-world, physical analogue of “surfing the Web.” The promise of wireless networked technology, from the standpoint of m-commerce, is thus to inscribe the productive spiral of spatial

dispersion into the interactive economy: not to minimize mobility but to redouble it in virtual form.

Consumers' motions through space open up new informational dimensions that can be used to further facilitate the consumption of space and the spatialization of consumption. Murdock (2006) has described new forms of "mobile consumerism" in which the solution to fostering new forms of marketing in an era of information glut "is to release commercial promotion into the environment integrating it into a range of cultural forms and employing interactivity to increase consumer engagement" (p. 27). Networked mobility enabled by the spread of wireless networks contributes to the productive spiral of mobility with a proliferation of portable individualized devices that enable the increasing specification and differentiation of consumers. Because these devices are portable, they become attached to particular individuals rather than fixed addresses (as in the case of desktop computers or terrestrial phones). Because they are interactive, they render geography both irrelevant in some respects and increasingly relevant in others: any space with access to a network can become a site for communication and information access, production, and sharing. The result is the de-differentiation of sites of labor, recreation, and domesticity: one can work from home, a café, the airport, a commuter train, or a public park. By the same token, workers can multi-task in the work place, conducting aspects of their social and family lives via mobile phones and email – where this is permitted or where restrictions are not effectively enforced. Different realms of social life come to rely on the same tools: mobile phones and laptops are used for both professional and personal purposes. Because these can accompany their users throughout the course of the day they are no longer location or task specific.

At the same time, for the purposes of commerce and consumption, location becomes an increasingly important demographic variable. Contextual advertising can target users based on the time-space paths they take through the course of the day in combination with other behavioral and demographic information. The advent of mobile commerce via interactive devices has spawned the neologisms "mocio-economics" to describe the "effects of mobile phone usage on human behavior, society and lifestyle in the twenty-first century" and "mobilology to refer to the study of the use of mobile phones" (Mobilium, 2010). Even as these technologies contribute to the rationalization of consumption described by Beniger, they are promoted for their contributions to personal expression and convenience: "Mobilology addresses the ways consumers personalize their wireless and mobile lifestyles, how they use their mobile technology to innovate their self-expression, and how they use their mobile phones and devices to facilitate increasingly mobile lifestyles" (Mobilium, 2010).

Similar technologies facilitate strategies for flexible and mobile production, keeping track of products, raw materials, and employees as they move through the supply chain. The advent of interactive forms of production helps blur distinctions between production and consumption: consumers can participate in creating customized

goods and services that they then pay a premium to consume. The recursive character of interactive forms of mobility allows consumers to generate information about their own movements and actions: they communicate information about their communication practices and behaviors. Spatial customization thereby serves as an incitement to the consumption of space as a form of productive subjectification. In contrast to the bourgeois interiority associated with the location of authentic subjectivity in the intimate realm of the home, subjective expression is projected outward through the consumption of space. The invitation of m-commerce is to specify one's individuality through motion.

It should be noted in advance that the consumption of space as a means of individuation is, in general, a form of consumption limited to affluent groups (as is the promise of individuation through the consumption of customized goods and services). As Morley (2000), quoting Doreen Massey, observed, the mobility of affluent classes is "quite different from the mobility of the international refugee or the unemployed migrant as a social experience" (p. 200) – not to mention the immobility of groups of people unable to relocate from regions of poverty, famine, and warfare. Nine-to-five clock punchers are replaced by a flexible, temporary workforce. At the bottom end of the economic scale, this implies the ability of capital to seek out low-wage workers around the world and to draw on the labor of low-paid immigrants (many of whom, despite predictions of postindustrialism and the demise of disciplinary society, continue to work in "old-fashioned" sweatshops). At the high end, it refers to "always-on-call" professionals who carry their work with them as they travel the globe and who move from company to company with an increasing degree of frequency: "Work anywhere anytime is the new paradigm [. . .] It amounts to a massive disaggregation of work, spinning outside the walls and confines of the traditional office" (Hamilton, 1996, p. 106).

Echoing Foucault (1978), it is tempting to observe that the bourgeoisie have endowed themselves with a "garrulous mobility" – one that permeates the ads for cell phones, cruise lines, and SUVs – and that just as there is a bourgeois form of monitored mobility, there are also class mobilities (subject to rather different forms of surveillance). The intersection of spatiotemporal paths can be used as hieroglyphic representations of particular kinds of social interactions. In keeping with the logic of convergence, these hieroglyphs, inscribed not in stone, but in space, serve double duty as feedback for the rationalization of production and policing. There is not a complementary balancing of time and space, but rather a collapsing of one extreme into the other. The lightest of media, electromagnetic, wireless forms of communication rely upon ponderous "server farms": buildings the size of several football fields filled with the infrastructure for cyberspace. The most ephemeral of actions, a passing interest, an impromptu detour through the city, are captured by and live on in the database, retrievable via algorithm for years – perhaps indefinitely as the cost of storage decreases in proportion to the exponential growth of processing power. The proliferation of forms of neo-orality including voice messaging and text messaging do not necessarily counter but perhaps coincide with the "cruelty of

mechanized communication” (Innis, 1951, p. 191). Increasingly, the conventions of personal communication are incorporated into forms of personal broadcasting on blogs, social networking sites, and text-messaging feeds that, like radio, “address the world instead of the individual” (Innis, 1951, p. 191). The conquest of space, in this context, refers to the creation of a ubiquitous electromagnetic atmosphere – not merely extension across space, but also a “filling-in” of space, so that wherever one goes, the network can be accessed and information can be retrieved, and feedback generated. Information is generated not simply about the movement of objects, but about the movement of messages, and, potentially, the tracking of the movement of messages. The interactive information generated by interactivity within this electromagnetic medium is without horizon: it echoes the bad infinity of capitalism itself: production for production’s sake.

NOTES

- 1 Although the essay in which the quote appears was originally published in 1989 (based in part on a 1981 tribute to Harold Innis), the quote itself, unsurprisingly, dates back to an earlier essay, “Canadian Communication Theory” (Carey, 1975), published in the last year of the Space Race (the year of the Apollo–Soyuz Test Project).
- 2 However it is worth pointing out that, in *Empire and Communications*, published a year earlier than *The Bias of Communication*, Innis pits radio against print: “The bias of paper towards an emphasis on space and its monopolies of knowledge has been checked by the development of a new medium, the radio” (1950, pp. 216–217).

Communication and Democracy

The Roots of Media Studies

Hanno Hardt

ABSTRACT

This chapter focuses on the contribution of social and economic thought to media studies in the United States. It details the migration of ideas from Germany and their creative application regarding the press to social and political conditions unique to the United States at the end of the nineteenth century. An evolving mass medium warranted theorizing its role and function in a democratic society and produced a critical literature of its performance. This chapter proposes that US media studies are partially the result of a realization in nineteenth- and early twentieth-century social thought that communication is an essential, binding force in a democratic society and partially the result of a turn to communication research void of larger philosophical concerns that had characterized the Chicago School in its consideration of communication and US democracy.

Media studies in the United States evolved with the rise of modern communication technologies, which had provided opportunities for creating cultural and political homogeneity and demonstrated their potential as instruments of social control. This chapter suggests that media studies are an outgrowth of developing social theories emerging in the nineteenth century, when an increasingly literate European civil society began to think freely about the necessary conditions of a modern world while

a new social dynamic materialized in technologies of communication that would help define the experience of relatedness that constitutes society and that would prove to be essential for conceptualizing democracy.

The history of US media studies, more specifically, is rooted in the dominant sociological preoccupation with communication as a measurable process, manifest in communication research and the earlier work of the Chicago School before it embraced an alternative understanding of communication as symbolic interaction and meaning-making. Thus, contemporary media studies emanate in the twentieth century from earlier academic undertakings (e.g., journalism, speech and communication studies, or mass communication research) as a field of inquiry reflecting the epistemological turns of social theory, and sociology in particular, with the rediscovery of ideology and the empowerment of the individual in the process of communication. The field had its beginnings, however, in various nineteenth-century attempts to analyze and understand the role and function of the press as a modern institution whose production and dissemination of information would shape and reinforce the development of society (for more detailed discussions, see Hardt, 1992, 2001). Meanwhile, the English-language literature regarding liberty of the press and democracy offers an exhaustive account of the social and political developments in the United Kingdom and the United States, but it lacks a major effort to include various political or philosophical considerations of communication and democracy pursued elsewhere on the European continent. This includes the migration of formative ideas from Germany that reached the United States at the end of the nineteenth century. These formative ideas are particularly important for understanding the fundamental arguments, for instance, regarding society and the role of communication that appeared in the early works of US social scientists.

Specific questions about the social and political power of the press and its potential in the realm of culture have been raised almost since the beginning of public communication, yet their formal study resumed much later mostly in the disciplinary context of a political economy of social forces before the introduction of sociology as a distinct discipline in the US academic context of the late 1880s. Its acceptance rapidly spread with the need for acquainting students with the social problems of a rising urban-industrial society as well as with the microcosm of human interaction in an era of major social changes featuring discrimination and causing alienation. Above all, sociology was conceived of as a practical science whose orientation embraced action and reform to place itself at the service of those committed to create a more just and virtuous society. According to Albion Woodbury Small (1854–1926), “Sociology in its largest scope and on its methodological side is merely a moral philosophy conscious of its task” (1907, p. 22). Thus, US sociology developed an interest in an analysis of social processes and their dynamics in a changing social and cultural environment with the ultimate goal of improving the conditions of society and thereby strengthening democratic practices.

The intellectual roots of US sociology and its interest in the role and function of media (or the press, more specifically) are found in nineteenth-century scholarship

in Germany, in particular, when US students sought a world-class education abroad before returning to the United States to settle in academic careers. According to Herbst (1965), “soon after 1870 American students of the liberal arts and the social sciences began going to Germany in large numbers [. . .] As the nation became industrialized, there was a need for specialists, scholars, and teachers trained in economics and statistics, and in allied areas of the social sciences and humanities” (p. 8). It was the rise of the professional class that accompanied industrialization in the United States. In the meantime, major social, cultural, and political shifts in Germany had begun to signal a new age. Mann (1968) described this period succinctly when he wrote, “From the stagecoach to the railway, the steamship, and the telegraph, from the faith of an earlier generation to unconcealed atheism and materialism, from Goethe to Heine, from Hegel to Marx, from Faust to the *Communist Manifesto* – this is the story of tremendous social and intellectual upheaval” (p. 52).

More specifically, the US students experienced the German press of the nineteenth century as an instrument of political authority, identified with Bismarck and Wilhelm II, before it changed into the hands of special interests and political parties; it was also curbed by censorship and stamp taxes. Thus, state or commercial interests interfered with the development of the press into an independent provider of information. They also learned that throughout this period German intellectuals, including academics, had realized the importance of the press for building a democratic society, and German scholarship had probed the social structure, the flow of communication, and the presence of newspapers. These were central topics in efforts to define and understand social and political change in Germany. This approach also characterized the work of several German teachers of US students, among them economists such as Karl Knies (1821–1898), whose academic pursuit confirmed the centrality of communication in a theory of society. Having studied the economics of transportation and telegraphy, Knies concluded that communication and the press belonged in a general framework of historical inquiry that was aimed at explaining the need for improving social relations.

Knies stressed the interdependence of the economic and cultural spheres of society, such as in his discussion of news. He suggested, for instance, that if “news is a commodity, it must have a certain value, an intrinsic value. But the intrinsic value alone is not inherent in the object itself, it can only be there if and as long as a human need exists for the news” (Knies, 1857, p. 67). Moreover, Knies acknowledged that the transmission of news had become a significant private business and thus increased the potential for manipulation and influence on society. In fact, Knies outlined the development of communication, from interpersonal contacts, when information passed directly from source to intended receiver, to the more advanced system of transmitting news and information with the aid of messengers, whose oral presentations replaced the intimacy of the dialogical relationship and increased the possibility of misuse. The upcoming primitive technologies of optical and aural systems of communication constituted a significant change with faster speeds and the coverage of greater distances. Moreover, news now could be received

indiscriminately by different individuals within the reach of the signal, replacing the need for personal contact. The process of news communication had become more impersonal. With the introduction of printing techniques, resulting in a tremendous growth of form, frequency, and quantity of messages, transportation became an important issue and led to the rise of occupational roles, such as news carriers, as postal services combined with the construction of railway lines across vast regions.

Knies (1857) also addressed non-economic considerations affecting the spread of news communication, such as physical mobility and alienation as a result of increasing rates of communication when improved means of communication brought people into contact with distant places and reinforced feelings of living in a changing and perhaps uncertain environment. However, the development of communication technologies, including the telegraph, supported the need of individuals to remain in communication, and news became a specific form in which people expressed their relationships. Knies (1857) defined news as the "communication of an event that occurs away from the location of the recipient" (p. 44). This definition focused on spatial rather than temporal elements of social communication, but he also acknowledged the fact that news is typically short-lived and thus of limited commercial value.

In this context, Knies (1857) acknowledged the commercial interests of the press, including questions of advertising, by concentrating on the idea of knowledge and information as expressions of power. He concluded that "knowledge is sales [. . .] and knowledge is production" (p. 49). For Knies, advertising remained a cultural document of society; it offered valuable information about the life of communities, and he proposed that it be used as evidence not only by social or cultural historians but also by politicians in their quest for learning more about the conditions of their localities or constituencies. At the same time, he asserted that the dissemination of advertisements and news and their potential effects on readers also challenged the moral responsibility of those in charge of these communication processes. Misuse in either case is easy but always at the expense of the trust and loyalty of readers. According to Knies, the economic basis of social communication systems, such as the commercial press, discriminated against the full participation by the illiterate and the poor in society. Also, any maturation of the social organism could only occur with improving the social communication systems, which would develop organizational and occupational roles for the collection and dissemination of information.

Throughout his work, Knies (1857) realized the centrality of communication in society; his discussion of the role of communication in the evolution of modernity frequently anticipated late twentieth-century social scientific concerns and findings regarding media and the state of the community. He emphasized the interdependence of economic and cultural spheres of society and thus promoted interdisciplinary analyses by using methodological perspectives that reflected a contemporary approach to qualitative media research.

Among the US students in Germany was Simon N. Patten (1852–1922), whose references to the teachings of the German historical school suggest that he, too, believed economic theory must be built on historical foundations, that economics

should be studied through an examination of the processes of culture, and that an understanding of civilization ultimately leads to an understanding of the economic system. Social reform and planned change in the US context also involved an analysis of communication, which implied not only a potential atmosphere of cooperation, but it also provided a basis for generating understanding.

According to Patten (1899), social control ultimately rests on opinion and thus involves the media. Indeed, the cultural milieu and the conditions under which people exist are determinants of media effects, and he illustrated his idea with a specific example of press coverage and its varied reception in different cultures. For instance, he wrote:

Newspapers of Europe in describing the American massacres used substantially the same facts and words, and thus created the same sensory impressions in all their readers. Yet the effect of these dispatches in the different countries differed widely, because the motor reactions created by the same news differed in the various countries, one nationality was indifferent, another merely grieved, while a third was angry and wished to interfere. (Patten, 1899, p. 3)

Patten's social concerns and the expressed need for decreasing social and economic differences through communication and cooperation resulted in a bill of economic rights, which included the right to publicity and to decisions by public opinion. They reflected his priorities in the struggle for progress and created new forms of social control by individuals who enjoyed freedom of thought and movement.

Patten's work is also reminiscent of Henry George (1829–1897), who had campaigned against the control of transportation and communication by private corporations, advocating nationalization for the public good. Patten's influence was widely acknowledged with his cultural perspective and his concerns for public welfare and economic and social reform. He supported the role of sociologists in the social change movement, and he was among nine social scientists who established the American Sociological Society at Johns Hopkins University in 1905.

A shared understanding of the importance of communication and the function of the press in society beyond specific cultural or political differences existed between German and US social scientists at the time, resulting from earlier contacts and the subsequent adoption of ideas by US scholars related to the workings of the social organism. For instance, Knies referred to his contemporary Albert Schäffle (1831–1903), whose work would feature prominently at Chicago several years later. Schäffle's organismic theory of society was based on the process of social communication as a binding force in society. He argued that progress and "the development of cultural community [. . .] of moral community [. . .] depends upon the development of a symbolizing technique and upon the adequate supply of steadily improving symbolic goods, upon the development of all forms of communication for intellectual intercourse involving knowledge, appreciations and decisions" (Schäffle, 1873, p. 6).

Understandably, the press played a major role in Schäffle's discussion of the commercial and intellectual life of society. Schäffle (1881) warned that the social sciences

would be mistaken to ignore or neglect the study of the public, the public sphere, public opinion, and the press; they form a homogeneous system. And he asked:

What else is the much debated public sphere, but an intellectual openness for social knowledge, appreciation and decision to be mediated symbolically through words, writing, and printing to the masses [. . .] What else is the public but a social mass, open, receptive, and reactive to the organs of social and intellectual activity [. . .] What else is public opinion but the expression of opinion, value and disposition of a general or special public? And finally the press – is it not the real transmitter in the intellectual exchange between the leading organs of society and the public? (Schäffle, 1881, p. 444)

More specifically, Schäffle's major theoretical work, *Bau und Leben des sozialen Körpers* (four volumes, 1875–1879), as well as an earlier article, “Über die volkswirtschaftliche Natur der Güter der Darstellung und Mittheilung” (1873), firmly suggested that any discussion of economic and political affairs cannot advance without an understanding of communication, although he did not offer a unified theory of communication. In this context he described the creation and internalization of symbol systems and the need for transmission of the resulting messages. For Schäffle, the printed word constituted a record of observation and reflection of the modern world where the press and literature become an organ of criticism and a technology of unification. Newspapers serve as an example of media as carriers of a variety of symbols reproduced for the benefit of their readers; they frame issues of reproduction in terms of useful consumption, reflecting the goals of an industry that tries to organize the reproduction of symbols in an economically feasible and profitable manner while advancing the needs of society for the reproduction and circulation of original news among the general public.

Schäffle's considerations of media and the economic consequences of industrializing the reproduction of communication necessarily lead to issues of influence and control in mass society. Because the press and the public are of universal importance to the intellectual life of society, Schäffle assigned responsibilities for a systematic treatment of communication and media to the social sciences. He offered a meaningful rationale for their study and analysis with an implicit indication of media studies as a legitimate academic concern. For Schäffle, the public sphere emerged as a site for the exchange of personal and material symbols, based on openness, and would always remain the battleground for the ideas and ideologies of an active and participatory community. Indeed, any removal of the public sphere would have to be considered a mutilation of the social body, not unlike removing its nervous system.

Schäffle recognized the public as individuals participating in an intellectual exchange, such as with the press, and he recognized the existence of many publics at any given time being connected through the press. The public as a basically passive and receptive social entity, therefore, constituted an object available to outside stimulation rather than to being considered an aggressive force. An exception is found in the rise of public opinion, which is extremely important for the discussion of social action, according to Schäffle. In this context the press constitutes a primary cultural

mechanism for channeling the flow of ideas and opinions. Indeed, the press becomes the most powerful means of influencing public opinion; it is a superpower, far superior to other means of communication, such as books or even conversations. Schäffle warned against underestimating public opinion in the service of promoting ideas or attitudes; it becomes the backdrop in the social drama set against those representing the dominant power in society.

Schäffle considered the daily press – as a constitutive element in the conceptualization of the social system – the most powerful institution for the exchange of ideas between people and their leaders; the press is a conductor or condensator of intellectual currents and typically seeks the company of government, political parties, and social or economic organizations. He also recognized that newspapers often suffer from a loss of credibility and need feedback to gain some measure of their editorial position. In their various manifestations, ranging from special-interest publications to the local press, these media represent a large and interconnected system for collecting and transmitting ideas. As such, they serve as an organ of public opinion. Consequently, the press becomes a desirable property and is targeted by a variety of social, political, religious, or financial interests either for purposes of propaganda or for mere speculation. It became obvious to Schäffle that both good and evil forces in society are compelled to use the press for persuasion, which could result in corruption and falsification.

Schäffle identified two major sources of corruption that affected the health of society: the centralization of government and the exploitation of the press by financial interests. Yet he suggested that because society as a whole is responsible for the quality of its media, over time it will acquire the media it deserves. His plans for reforming the press became part of an economic reform by which the press would be freed from financial speculation and advertising control. They were based on the need for protecting individual and collective freedoms of expression, which can only be guaranteed when the production and dissemination of ideas remain absolutely free and undisturbed by capitalist or bureaucratic efforts to organize the activities of the press for financial gain or political control. Although Schäffle recognized the corruption of the contemporary press because of the economic organization of German society, he still believed that the press remained the most pervasive instrument of social communication. Schäffle blamed these unfavorable conditions also on the social sciences, which had been unable to provide necessary insights into the manipulation by government, journalists, and publishers. Echoing Comte's hope that progress in the social sciences would end the corruption of the public spirit, he also projected sentiments found in the early writings of US social sciences, notably sociologists.

Karl Bücher (1847–1930) represents yet another contributor who emphasized the cultural–historical approach to communication and economic development, citing the need for media systems in economies based on the exchange of goods and services, the problems of journalism in industrial societies, and the overriding commercial interests of the press. Influenced by Schäffle, Bücher provided by far the most

extensive discussion of the press among German economists, whose ideas were known by Robert Park, for instance.

Knies's and Schäffle's thoughts also are reflected in the early writings of Karl Marx, who saw the press as a pivotal institution in modern society, realized its potential as a means of persuasion, and considered it an indispensable weapon against political authority and for the rule of democratic ideas (Hardt, 2001, p. 39). These ideas resurfaced – including a Spencerian theory of society, not unlike Schäffle's conceptualization of society – several years later, particularly in the work of Albion Small (1854–1926), whose goal for sociology was the development of a comprehensive theory of society. According to Matthews (1977), Small's career influenced the development of American sociology both practically and theoretically. Small built the largest and most influential department in the United States and founded the *American Journal of Sociology* (1895). Based on the works of an Austrian sociologist (Gustav Ratzenhofer) and US pragmatists (John Dewey, William James) as well as on the insights of the German Historical School, Small concluded that sociology was best suited for a detailed and reform-oriented analysis of particular phases of the social process rather than for the discovery of an absolute social system.

To understand the work of US social scientists during the later part of the nineteenth century, it is necessary to recall that it occurred at a time when immigration and urbanization had introduced new challenges to the organization and control of social life. An understanding of the city as a new social and cultural environment, accentuated by the influx of a non-English-speaking population, raised a number of social issues related to the survival and growth of democratic practices under hitherto unknown conditions. More specifically, US social scientists and the sociologists at the University of Chicago, in particular, responded to the practical challenges posed by social and economic changes and the workings of US capitalism. Their position in relation to the dominant political ideology and the interests of the ruling class was marked by the desire to reinforce social control through an objective analysis of the political process in an effort to secure consensus, encourage cooperation, and strengthen social justice.

Their work is characterized by an interdisciplinary approach to the analysis of social phenomena with history, philosophy, political economy, and social psychology contributing to insights into the nature of society and confirming the importance of culture as the site of explanation. Academic training in a number of disciplines allowed the mind to operate in a wider berth of knowledge. Thus, nineteenth- and early twentieth-century scholarship benefited from a broader intellectual perspective regarding issues of communication and society, in particular, than a later trend toward specialization would offer. In this context, Small's work signaled the beginning of a sustained and intensive interest of members of the sociology department at the University of Chicago (the Chicago School) in notions of communication, public opinion, and media (the press) based on their work on social control, urbanization, and democratic institutions. In fact, the significance of the various means of communication, including telegraph, railroads, highways, and rivers as means of

transportation, and the spread of schools and newspapers as institutional sources of knowledge, also provide some of the historical background for discussions about the place of communication in modern society. Finally, the emerging concerns about communication also reflect the focus of pragmatic philosophical thought regarding language, understanding, and the search for consensus in a democracy.

An expert on developments in Germany, Small offered a detailed presentation of the German social sciences and their impact on US sociology between 1800 and 1900 in his *Origins of Sociology* (1924), in which he discussed, among others, the work of Knies and Schäffle, including a sociological approach to economics. At the same time, Small remained aware of the elementary and unsubtle nature of the social sciences, based on rationalization rather than on an investigation of social phenomena.

Given his theoretical orientation, Small followed Schäffle's emphasis on communication as a necessary condition for the development of society with language becoming the privileged medium for passing on traditions. Small also identified with Schäffle's definition of sociology, which would change over time but still showed Schäffle's influence. He suggested that sociology is a basic social science, part of a unified and cooperative process, open to insights from other social sciences regarding techniques, for instance, that may help arrive at a more comprehensive understanding of the material conditions of a social existence. Small relied on his knowledge of economics, political science, and history for his sociological quest and for his pursuit of social justice. His analysis of the social environment concentrated on the notion of human interests and their social control.

Not unlike Schäffle, Small described an organismic theory of society in which the media of communication (the press) feature prominently. This idea was expressed first in his *Introduction to the Study of Society* (1894, with George M. Vincent), in which he recounted the evolution of society, using organic analogies to analyze social structures and functions. Accordingly, communication is part of a regulatory system that penetrates the social organism and operates "as the nerve fibers to the coordinating and controlling centers in the animal organism" (Small & Vincent, 1894, p. 215). Communication in society consists of a combination of psychic and physical changes that bring about the successful transmission of messages. Thus, "every social communication is effected between individuals, and every individual is part of many different channels in the social nervous system" (Small & Vincent, 1894, p. 216). This model implies that individuals are not only mediators but also terminal cells in the process of communication.

Following Schäffle's elaboration regarding symbols and communication, Small and Vincent (1894) listed among those symbols "oral, written, and printed language, vocal and instrumental music, gestures, drawing, photographs, paintings, statutes, theatrical and operatic representations" (p. 219). The preservation of ideas and the coordination of communication through postal services or telegraph companies suggest a structure that could provide technical devices to accommodate the presentation of symbols over space and time. The success of social communication, however, hinges upon the presence of interwoven channels such as the press, as well

as commercial, educational, ecclesiastical, and government systems of communication. Small and Vincent (1894) saw the press, for instance, as “incorporated in nearly every division of the psycho-physical communication apparatus and is almost as general in its scope as the post office itself” (p. 223). The communication network, as described by Small and Vincent, is composed of general and special-interest newspapers as well as national and international news agencies and press syndicates, which disseminate identical messages throughout the social system with the aid of agencies responsible for the transportation of printed materials. To illustrate the operations of such a communication system, they explored the working arrangements of a telegraph editor, who connects the newspaper with the outside world, involving selection and follow-up on news items.

Increasing industrialization and the growth of an urban population contributed to the rise of opinion leaders and an increase in the power of newspapers as social institutions beyond their immediate environments. Small and Vincent (1894) described the rise of experts as opinion leaders, who enhance social knowledge and direct sentiments. Not unlike Schäffle’s discussion of newspaper practices in Germany, the press became the most important instrument for the communication of ideas between authorities and their adherents. In addition, Small and Vincent commented on the social and cultural role of the press and its widespread use among those who seek to impress their fellow citizens in matters of public interest. They were convinced that advanced studies of society would yield more evidence to show the immense influence of the press, and at the same time realized that different interests may well use the press for purposes of manipulation, such as the coercion of authorities through the use of letters to the editor. Because of their conclusions, the authors advocated a close examination of the press enterprise and practices, and encouraged commentaries on the duties and responsibilities of newspapers. They lamented the lack of factual reporting, carelessness, inefficiency of news coverage, and sensationalism combined with self-interest. Likewise, they critiqued the economic dependence of the press, following Schäffle, realizing that subscription and advertising were the major determinants of the commercial well-being of newspapers, which must also cater to reader interests and, thus, must remain adaptive. On the other hand, Small and Vincent understood that the press cannot be held responsible for the general problems of society. They insisted that responsibility must be shared throughout the social system, suggesting public participation in controlling press behavior.

Throughout, Small’s work reflects a strong and lasting influence of Schäffle’s social theories and writings on society that privilege communication as a social process; the latter remains at the center of sociological inquiry with a focus on the press, which serves as the collector and disseminator of information in a system of public communication. Small also moved beyond these claims by addressing the gatekeeping functions of editors, indicating the two-step flow of communication and thus identifying a future topic and concern of media studies.

His contemporary, William Graham Sumner (1840–1910), who taught at Yale, showed great interest in economics and social problems and had concluded that the

press, torn between public responsibilities in a democracy and its potential in the commercial world, is “on one side, an institution of indispensable social utility, and on the other side a foul nuisance. It exerts a tyranny which no one dare brave,” suggesting that “what priestcraft was for the fourteenth century, presscraft is to the twentieth” (Sumner, Keller, & Davie, 1927, pp. 233–234). Given the development of the prosperous yellow press, Sumner recognized there was little reason to believe that the quality press would become more successful. Consequently, he doubted the usefulness of public discussions or the presentation of complicated issues as long as the number of subscribers remained more important than reflection or debate. Yet Sumner saw the power of language, communication, and public opinion as elementary forces in society.

Among Small’s colleagues in Chicago, George Herbert Mead (1863–1931) offered by far the most extensive discussion of the role of language and communication in the making of the self as well as in the creation of community. Mead (1969) insisted not only that symbolic interaction features in the creation of the self, but also that media such as the press “report situations through which one can enter into the attitude and experience of other persons” because society cannot be built “out of elements that lie outside of the individual’s life-processes” (p. 257). Mead concluded that communication is the organizing process of the community and that the ideal human society is one that “so fully develops the necessary system of communication that the individuals who exercise their own peculiar functions can take the attitude of those whom they affect” (p. 327). The media of communication, including novels or plays, assume a pivotal role in this process, which includes a receptive and active self and demands for its analysis by the application of scientific methodology.

These conclusions found their practical application in Mead’s democratic convictions and his awareness of social inequality in US society, which called for political engagement. Mead’s notions of a democratic life were related to the work of John Dewey (1859–1952) and his appreciation of communication, which must play a major role in the formation of community as an active and intelligent force. Not unlike Mead’s insistence on the importance of media such as the press, Dewey (1925) also paid attention to this ideal mechanism for the transmission of ideas. But he also realized the dangers of public communication because the ongoing centralization and concentration of the means of production affected the press and, thus, created problems for a democratic society. More specifically, he addressed systems of communication that had been created outside the community and hence would neither respond nor be responsible to the community. For Dewey, communication established the individual in a system of mutual relationships and common purposes and offered opportunities for shared experiences, discourse, and reflexive thinking. Dewey (1925) concluded that “of all affairs, communication is the most wonderful” (p. 166), and it is also “uniquely instrumental and uniquely final” (p. 204), providing choices and solidifying meanings in a community setting.

During the next generation, considerations of communication and media in the United States continued with the work of Robert Park (1864–1944), who had studied

with John Dewey and William James and who had been educated in Germany under the tutelage of Wilhelm Windelbandt at the University of Heidelberg before he joined the sociology department at the University of Chicago. Park was more interested in the practical consequences of communication and the press specifically as an aspect of social control, such as in his *The Immigrant Press and Its Control* (1922). He was an observer, trained as a newspaper reporter in Minneapolis and New York City, interested in facts, and throughout his later academic career conscious of the effects of communication and its divisive potential, including the role of the press. Park's interest in the function of the press is also reflected in his use of Bücher's (1921) remarks on the "Extension of Communication by Human Invention," which focused on the effects of new communication technologies on society, which Park published in the student edition of his *Introduction to the Science of Sociology* (Park & Burgess, 1921).

Finally, it may be worthwhile to mention the contributions of Louis Wirth (1897–1952) and Morris Janowitz (1919–1988) at Chicago. Both addressed issues of communication and media in the tradition of the Chicago School. Wirth had been Park's student and had studied with Small, William I. Thomas (1863–1947), Ernest W. Burgess (1886–1966), and Mead for a doctorate that he received in 1925. Wirth was a major urban sociologist with an interest in city life, minorities, and media. His address to the American Sociological Society in 1947 on "Consensus and Mass Communication," in which he outlined the role of urban media in consensus building, was published in the *American Sociological Review* a year later (Wirth, 1948).

Janowitz had graduated with a doctorate in sociology in 1948. Interested in the organization and regulation of society, Janowitz (1952) analyzed the community press, representing the symbolic dimension of the urban space that "acts as a mechanism to maintain local consensus through the emphasis on common values" (p. 11). In this context he also provided a discussion of the role and function of the immigrant press in the works of Park, Thomas, and Florian Znaniecki (1882–1958). Later Janowitz co-edited (with Bernard Berelson) one of the first compilations of relevant articles in the *Reader in Public Opinion and Communication* (1950); the editors concluded in their introduction to the second edition (Berelson & Janowitz, 1966) that "the hope is no longer prevalent that democratic institutions are automatically strengthened with the growth of the mass media, the development of literacy, and the extension of the popular franchise" (p. 1). Their remarks left readers wondering about the consequences of these insights regarding media studies and their place in defense of democratic ideals, which had moved the work of the Chicago School into the twentieth century.

The scholarship of the leading members of the Chicago School since the nineteenth century was consistently united in its determination to help perfect the cause of democracy in the United States by offering a critique of capitalism while embracing the fundamental political ideas of the country. Notions of communication in its individual or institutional form played a central role in conceptualizing and applying a model of democratic life as a participatory and responsible community of individuals empowered

by knowledge, materialized in public opinion, and disseminated through conversation and media such as the press. These considerations of public communication were typically accompanied by noting the ethical dimension of communication in a commercial system, not unlike observations revealed in the earlier German scholarship of Knies and Schäffle. In fact, a more general belief among German academics that cultural subjects were unique and could not be validated by scientific methods but warranted historical explanations typically contained an ethical mandate.

More specifically for these US authors, the process of public communication demonstrated the relationship of communication, privilege, and responsibility in an increasingly secularized society with an extended reliance on expert knowledge for reaching consensus and advancing democracy as a participatory experience, as indicated by Small and Dewey. Mead also emphasized the importance of the moral self as a participant in the process of democracy, a view shared by Park, for whom the moral order installed conscience, a sense of obligation. Indeed, self-interest must give way to higher moral principles in the political arena, according to Small, and Janowitz (1978, p. 3), and public communication constituted the necessary means of this process. For those members of the Chicago School who had proposed a communication- and media-centered definition of society, there were ethical concerns inherent in the relations between truth and understanding or community and communication that played a major role in conceptualizing democracy.

While Small represented the first generation of sociologists who were prepared to apply their knowledge and social scientific interest to the improvement of a democratic existence, his contemporaries Mead and Dewey shared visions of democracy that were based on the power of communication and the workings of an active community. Neither was this appreciation of communication and media as central social processes lost on the following generations, from Park to Wirth and Janowitz, whose academic pursuits reflect a continuing concern regarding the importance of media, their quality, and their service to their respective communities.

The critique of capitalism, however, in the writings of these members of the Chicago School remained within the realm of pragmatic considerations that were aimed at balancing instead of eradicating the negative forces in US life, thus fixing the limits of potential change while steeped in the predominance of Protestantism, which was well suited to sustain a belief in an evolutionary model of society. Their concomitant reflections on the moral responsibilities of those engaged in producing media contents and directing the public discourse indicate the beginnings of a moral philosophy of public communication.

Consequently, the history of media studies in the United States builds on the tradition of the Chicago School, but unlike the sociological imagination of the Chicago School, rarely included issues of communication in the broader context of serving the need to remedy existing social and political conditions and of securing the American Dream. The fact that notions of communication and democratic practice – as articulated by the Chicago School – found their way into the vocabulary of US media studies, together with an acknowledgment of the work of individual scholars

like Dewey, rather provided a legitimating argument for intellectual proximity and historical tradition.

The Chicago School, on the other hand, had offered a sociological perspective on matters of communication in society that placed the importance of media at the core of a working democratic system while raising questions about the impact of social change on the notion of community and on the form and function of participation, cooperation, and consensus in a system of coexistence. Implicit in an emerging liberal critique of capitalism was the inescapable condition of change and the constant need for readjustment.

Since then, the twentieth-century rendition of media studies has been shaped by the field of mass communication research, which had responded in large measure to the demands of government and industry since the 1940s for objective, quantifiable observations of specified social and political phenomena. Consequently, the dominant version of media studies has left a gap between broader philosophical or theoretical considerations and the priorities of empirical research.

During the post-World War II era, any critique within media studies of capitalism as an ideological foundation of media practices has remained marginalized. When critique arose, it belonged to the literature of social criticism. However, a British reaction against an “Americanized,” effects-centered study of mass communication has resulted in the return of ideology (Hall, 1980) and addressed issues of empowerment; it ushered in a period of critical communication research in the United States. These developments helped late twentieth-century media studies launch its pursuit of a progressive, communication-centered, cultural vision of democracy and rekindled the emancipatory, interdisciplinary spirit of the earlier sociological scholarship of the Chicago School.

The Chicago School of Sociology and Mass Communication Research

Rise, Rejection, Incorporation, and Rediscovery

Karin Wahl-Jorgensen

ABSTRACT

While the Chicago School has subtly but profoundly shaped and influenced the direction of scholarship on mass media, the history of its engagement with mass communication researchers is also a history of missed connections and opportunities. At least two different stories can be told in tracing the legacies of the Chicago School on work in media studies. One is a tale of triumph: The Chicago School has had a significant impact on scholarship in the field, in its normative assessment of the media's role in society and its empirical work in understanding it. Another is a tale of loss and marginalization, witnessed by the decline of the socially engaged and often qualitative approach of the school and its diminishing presence within the collective conscience of the discipline today. Both of these stories are true. The Chicago School arose out of a particular moment, with its companion preoccupations and anxieties, but its contributions subsequently fell to the wayside in the face of profound epistemological shifts. The Chicago School gave voice to the idea that media and communication have a central role to play in shaping individual and collective lives, and in cementing identities and communities. This idea has helped to justify and solidify the notion that we cannot understand society without understanding how we communicate with each other and how the media shape our social bonds and social worlds.

Introduction: Situating the Chicago School of Sociology

The Chicago School of Sociology is perhaps best known as a home-grown US attempt at understanding the relationship between individuals, communities, and societies. In charting its importance for mass communication research, this chapter grapples with a seemingly paradoxical question: Why is it that the Chicago School is so frequently invoked as an ancestor for our field when its methodological approaches and substantive concerns have so little in common with most of what counts as mass communication research today?

The chapter argues that while the Chicago School has subtly but profoundly shaped and influenced the direction of scholarship on mass media, the history of its engagement with mass communication researchers is also a history of missed connections and opportunities. On the basis of these complexities, at least two different stories can be told in tracing the legacies of the Chicago School on work in media studies. One is a tale of triumph: The Chicago School has had a significant impact on scholarship in the field, in its normative assessment of the media's role in society and its empirical work in understanding it. Another is a tale of loss and marginalization, witnessed by the decline of the socially engaged and often qualitative approach of the school and its diminishing presence within the collective conscience of the discipline today. Both of these stories are true and witness to the difficulty of making totalizing claims about history. Either way, it is the case that the Chicago School arose out of a particular moment, with its companion preoccupations and anxieties, but that its contributions subsequently fell to the wayside in the face of profound epistemological shifts. These conditions notwithstanding, the Chicago School gave voice to the idea that media and communication have a central role to play in shaping individual and collective lives, and in cementing identities and communities. This idea has helped to justify and solidify the notion that we cannot understand society without understanding how we communicate with each other and how the media shape our social bonds and social worlds.

The chapter first examines the interests of the Chicago School and its intersections with the study of mass communication, and then looks at how mass communication scholarship has since evolved in ways that have both drawn on and departed from the Chicago School. In particular, the chapter examines different strategies of the field, describing these in terms of incorporation, rejection, and rediscovery. First, it touches on the well-known reasons for the *rejection* of the methods, insights, and ontology of the school among the communication scholars who institutionalized the discipline. Secondly, it examines in detail the little-discussed *incorporation* of the Chicago School into the work on propaganda and public communications during and following World War II. Thirdly and finally, it briefly discusses the *rediscovery* of the work by several prominent critical and cultural studies scholars, demonstrating how it has sustained its influence in the subfield of journalism studies.

These strategies of rejection, incorporation, and rediscovery have been shaped by a variety of factors, including the influence of political, social, and economic circumstances, the vagaries of institutional support or indifference, and the initiatives of particular individuals. The chapter ultimately argues that the Chicago School, despite its limited influence on the field today, has nevertheless been claimed as an ancestor and an inspiration. In fields of scientific inquiry characterized by ever-increasing specialization and fragmentation, the fate of the Chicago School therefore has much to tell us about disciplinary politics and development.

The chapter assumes that any historical account is essentially a metanarrative that reveals as much about the storyteller as it does about the story. The tales we tell about ourselves as scholars dramatize our disciplinary anxieties and self-understandings; by including some traditions, individuals, and theoretical and methodological approaches and excluding others we make heroes and villains out of scholars and schools as a way of designing an institutionally and normatively desirable image of a discipline (Dervin, Grossberg, O’Keefe, & Wartella, 1989; Park & Pooley, 2008). As Carey (1997) put it in his own account of the Chicago School, the history of mass communication research is a

self-conscious creation (and now an endless recreation) that sifts, sorts, and rearranges the accumulated literary debris into a coherent narrative. The narrative that emerges serves ultimately a variety of purposes: principally to focus, justify and legitimize a twentieth-century invention, the mass media, and to give direction and intellectual status to professional teaching and research concerning these same institutions. But it is hardly an innocent history, for it was invented with a political purpose: an attempt to cast loyalties, resolve disputes, guide public policy, confuse opposition, and legitimize institutions. (Carey, 1997, p. 14)

Disciplinary histories play a central role in the maintenance and production of knowledge: They both hail disciples and enforce disciplinarity. More than anything, disciplinary histories provide the leverage for particular understandings of rationality, or of what we understand as valid approaches to scholarly work (cf. Aronowitz, 1988, p. 8). Lofland (1983) insightfully remarked that “the ‘Chicago School’ is a kind of projective device; descriptions of it seem to reveal as much about those doing the describing as about the phenomenon itself” (p. 491). For those who have embraced the Chicago School as central to the myth of disciplinary origins, such an understanding has enabled the grounding of a cultural studies approach to mass communication in the US experience (Pauly, 1997).

The History of the Chicago School

The University of Chicago, founded in 1892, prided itself on belonging to a new breed of US universities, modeled on the German tradition of excellence in higher

education that emphasized research and graduate training (Bulmer, 1984, pp. 14–15; Rogers, 1994, p. 38). What is commonly described as the “Chicago School” refers to scholars representing a number of disciplines, most prominently sociology and philosophy, who left a lasting imprint on the social sciences and humanities in highlighting the centrality of interaction and communication – between people and through mass media. Here, I will provide a brief and necessarily partial history of the Chicago School, with particular attention to its roots in urban sociology, analyzing how this context defined its engagement with media and communication. My story pays particular attention to Robert Ezra Park, the figure most commonly associated with the Chicago School among communication scholars, as someone who more than anyone demonstrated the relationship between the philosophy of pragmatism and the fascination with social interaction, mass media, and communication.

The Rise of the Chicago School

The Chicago School of Sociology was founded in 1892 by Albion Small, who has consistently been described as a discipline-builder and administrator rather than a strikingly original thinker in his own right (Bulmer, 1984; Smith, 1988). He not only established Chicago as the most important center for sociological study in the United States but also founded the *American Journal of Sociology* in 1895, edited the journal until his retirement in 1925, and was a prolific contributor to its pages (Smith, 1988, p. 76). From the beginning, Small and his colleagues envisioned sociology as a social science engaged with tangible problems of urban life – and were determined to make a difference (Bulmer, 1984, p. 23). As the University of Chicago emerged as a major center for scholarship in the emerging discipline of sociology, it began to attract core scholars who have since been associated with the Chicago School. Known as the birthplace of pragmatism and symbolic interactionism, the Chicago School has been seen as the dominant force in shaping the institutionalization of sociology, particularly in the period from 1915 to 1930 (Bulmer, 1984), even if at its outset it “served as something of a refuge for outcasts, radicals, and misfits who wanted to ask critical questions about the nature of modern society” (Peters & Simonson, 2004, p. 16).

The key figures usually associated with the school include Park, W. I. Thomas, Charles Burgess, and George Herbert Mead, but other scholars who moved through or influenced those working at the school are frequently linked to it. Among these were Charles Horton Cooley, who taught Mead, and John Dewey, who taught Park and spent a number of years at the University of Chicago, though outside the sociology department and associated more closely with the fields of education, psychology, and philosophy (Rogers, 1994, pp. 150–163).

As this chapter later discusses in more detail, the school also encompassed prominent scholars whose work has strongly influenced the course of research on mass communication but who have not been associated with either a pragmatist philosophy or symbolic interactionism. Sociology was a new kid on the scientific block when

the Chicago School began the work it is known for today. As vividly described by Matthews (1977):

In 1913, the growing academic field of sociology was a partly institutionalized alliance of three separate activities: formal speculation about the nature of society, Christian philanthropy and exhortation, and descriptive studies designed to display the magnitude of social problems to an educated and morally homogenous citizenry. (Matthews, 1977, pp. 1–2)

This new field was viewed with suspicion and disdain by more established disciplines (Smith, 1988), and while the Chicago School was influenced by these established sociological activities, it also did much to cement the recognition of sociology as a legitimate and rigorous discipline.

Albion Small made no small contribution in this regard. He was a productive scholar who set out to introduce the work of German scholars such as Knies and Schäffle to US audiences (see Chapter 25, this volume) and worked conscientiously to define the field of sociology in organic and interactionist terms representative of the Chicago School. As Small (1912) wrote:

We now say that human experience is chiefly an affair of associatings between persons, in their copings with the physical and psychical conditions to which they are subject. That is, presupposing the physical factors, and also the consciousness of factors into which personality may be resolved (both of which groups of factors are in the first instance problems not of general sociology at all but of other disciplines), “experience,” which presents the problems of sociology, is the phenomena of the lives of persons in the course of developing and using their endowment as sentient beings. Experience then is never strictly solipsistic. It is always social. (Small, 1912, p. 209)

Small’s discussion here is by no means unique, but rather characteristic of the strain of thought associated with the Chicago School. It is given expression in the work of Cooley, who is often credited as the father of symbolic interactionism. Cooley spent his entire career at the University of Michigan but taught Mead and was a student of Dewey (Czitrom, 1982, pp. 91–92). Introducing the idea of the “looking-glass self,” Cooley suggested that the “self” can only come into being through interaction and communication with others (Czitrom, 1982, p. 98).

Nevertheless, in the work of Small and other Chicago scholars, this emerging preoccupation with social interaction as the foundation of self and community was tailored to the circumstances of its conception. The Chicago School was born in a unique, complex, and compelling environment: a city home to a bewildering variety of ethnic and national diversities. Between 1840 and 1890, the city’s population soared from 4,500 to more than a million (Bulmer 1984, p. 13), and by 1900, it was estimated that half of its 1.7 million inhabitants were foreign-born, with a particularly significant influx of Europeans compelled to cross the Atlantic by poverty, unemployment, and war in their home countries. Such a diverse and rapidly growing

population gave rise to anxiety, exhilaration, and, in the case of the Chicago School, inspiration. Lincoln Steffens famously described Chicago as “first in violence, deepest in dirt; loud, lawless, unlovely, ill-smelling, new; an overgrown gawk of a village, the teeming tough among cities” (cited in Bulmer, 1984, p. 13). To the Chicago sociologists, the city became, in Park’s words, a “social laboratory” for scholars interested in diversity.

Park has been seen by many observers as the anchor of the Chicago School of Sociology throughout its glory years (Pooley, 2006, pp. 64–66). His view of the city as his laboratory, and his interest in the role of media within it, were hugely influential to his colleagues and students but also representative of the worldview underpinning the Chicago School as a whole. Before arriving at Chicago in 1913, not long before his 50th birthday (Smith, 1988, p. 112), Park had worked as a newspaper reporter throughout the country and as a publicist for African American leader Booker T. Washington, among an eclectic variety of professions. In an autobiographical note, Park (1950) traced his interest in sociology to his reading of Goethe’s *Faust*: “Faust was tired of books and wanted to see the world – the world of men” (p. v). His interest in newspapers was premised on “the discovery that a reporter who had the facts was a more effective reformer than an editorial writer who had merely thundered from his pulpit, no matter how eloquently” (p. vi). To Park, the sociologist was a “super-reporter” who could improve conditions by understanding and communicating the actual lived realities of social life (p. vii). As Lindner (1996) put it, much of Park’s work before his entry into sociology seems “to act like the conveying of systematic knowledge for the purpose of acquiring knowledge from experience” (p. 37). These reflections revealed Park’s positivist, progressive, and pragmatist orientation, expressing the conviction of practice as the foundation of human knowledge, of the intimate relationship between knowing and doing (Smith, 1988, p. 60).

In an early essay on the city, which set out an ambitious research program that occupied him and his students for the next generation, Park (1916) opened with this spirited mission statement:

The city, from the point of view of this paper, is something more than a congeries of individual men and of social conveniences [. . .] something more [. . .] than a mere constellation of institutions and administrative devices [. . .] The city is, rather, a state of mind, a body of customs and traditions, and of the organized attitude and sentiments that inhere in these customs and are transmitted with this tradition. The city is not, in other words, merely a physical mechanism and an artificial construction. It is involved in the vital processes of the people who compose it; it is a product of nature, and particularly of human nature. (Park, 1916, p. 577)

Park, Small, and other Chicago sociologists were heavily inspired by organic conceptions of sociology, such as those evident in the work of Herbert Spencer and Georg Simmel, and took much inspiration from ecology. In Park’s case, such a view also chimed with his romantic self-understanding, derived from his upbringing in the rural Midwest. Despite long years as a newspaper reporter, during which he “covered

more ground, tramping around in cities in different parts of the world, than any other living man,” Park proclaimed his love of “the common things, earth, air – the song of the robin and the great herds of common people, simple and natural as cows” (cited in Matthews, 1977, p. 11). Park valorized “the natural” and his research practice reflected this.

At the heart of the Chicago sociologists’ preoccupations, however, was a distinctly normative and often moralistic project that was aimed not merely at understanding and describing difference but also at taking an active role in ensuring social cohesion and the upholding of moral values. Such a direct engagement was not out of place in the Progressive Era, characterized by a desire for social reform and the belief in the ability of science to deliver it. The sociologists’ engagement with social problems was based on the view that the social science researcher can both objectively observe and describe events and phenomena through the use of scientific methods (Park, 1922, p. 15) and actively participate in the improvement of society. Key members of the Chicago School such as Small, Park, and Burgess participated in local civic organizations and charities designed to help the underprivileged, and work in the department was closely tied to Jane Addams’s Hull House, a tenement house for European immigrants that drew on sociological ideas to advance social cohesion (Peters & Simonson, 2004, p. 25). Chicago scholars practiced the sociology of the underdog, the misfits, and the marginalized – what Park (1928) called the “marginal man.” They took from progressives and investigative reporters such as Upton Sinclair an interest in uncovering the life of seemingly marginalized groups in the city – youth gangs, marijuana users, hoboes, and taxi dancers – who nevertheless displayed their own complex forms of social organization (cf. Galliher, 1995).

Perhaps the most famous product of the Chicago School was Thomas and Znaniecki’s epic account of the experience of *The Polish Peasant in Europe and America*, published between 1918 and 1920. One of five volumes looked at the role of popular Polish papers based on the assumption that “through the paper the individual as well as the community enters into relation with the external world” (Thomas & Znaniecki, 1958, p. 150). The centrality of newspapers was representative of the sense of communication as the cement of social life. As Park and Burgess (2004) wrote in the *Introduction to the Science of Sociology*, which became a foundational text in the discipline and was referred to by students as the *Green Bible*:

History has been variously conceived in terms of great events, epoch making personalities, social movements, and cultural changes. From the point of view of sociology social evolution might profitably be studied in its relation to the development and perfection of the means and technique of communication. (Park & Burgess, 2004, p. 34)

To Park, Burgess, and their colleagues at Chicago, questions about how to improve newspapers and other media were central to this process as they went about studying how the ethnic groups that shared Chicago sought to make sense of and survive there. Park was interested in questions of communication throughout his career.

Rogers (1994) suggested that he chose sociology because “the scholarly study of communication was not available at universities” (p. 176). However, it could also be argued that Park (1936) viewed media and communication as integral to the functioning of society viewed in organic terms but as necessarily part of a larger set of questions around cultural and social processes.

One well-known example illustrates how Park’s views of the media were tied to issues of social integration. Before joining the University of Chicago, between 1889 and 1892, Park famously collaborated with journalist Franklin Ford and John Dewey on a much-discussed (but ultimately failed) experiment to launch an experimental newspaper, *Thought News* (Carey, 1989; Peters, 1989). The idea behind *Thought News* was that it would be a monthly, subscription-based newspaper based on reporting the findings of sociological research for the betterment of society – or newspaper reporting on “thought” (Pinter, 2003):

[It] shall treat questions of science, letters, state, school and church as parts of the one moving life of man and hence of common interest, and not relegate them to departments of merely technical interest; which shall report new investigations and discoveries in their net outcome instead of in their overloaded gross bulk; which shall note new contributions to thought, whether by book or magazine, from the standpoint of the news in them, and not from that of patron or censor. (Cited in Czizrom, 1982, p. 107)

This mission statement, co-written by Ford and Dewey, revealed the holistic and organic view of communication and the authors’ implicit critique of shortfalls in conventional news reporting. *Thought News*’s conception was based on the founders’ dissatisfaction with the ability of existing newspapers to create community bonds in the rapidly growing urban environments of their time. To those associated with the pragmatist tradition, there was a strong belief in conveying not merely the “facts” but also the “meaning about the facts” (Dewey, 1954, p. 3) based on the premise that truthful and contextualized information could cure social ills by allowing intelligent individuals to make sense of the world around them. As Peters (1997) compellingly put it, *Thought News* was grounded in the belief that “what society lacks (a sense of community or spiritual unity) new forms of communication will supply. They thought the losses in face-to-face communication in the great society could be compensated by new mechanisms of distance communication” (p. 10).

The project failed; it proved to be simply too expensive and administratively complex to be a commercially viable proposition. But it profoundly shaped the thought of Dewey and Park. Dewey, another figure closely linked to the Chicago School, was already well known for his ideas around the need for the press to play an active role in the creation of community life – ideas that were resonant with contemporary European thinkers (Peters, 1989). These ideas reflected anxieties around the consequences of urbanization and, in Tönnies’s terminology, the consequent victory of the *Gesellschaft* over the *Gemeinschaft*, or of impersonal, distant contractual relations over closely knit community bonds based on sociality.

Dewey's concerns for the health of public life later gave rise to his debate with Walter Lippmann over a perceived crisis of public communication and citizenship.¹ In his book *The Public and its Problems*, first published in 1927, Dewey once again expressed his faith in the ability of information to create communal ties, noting that "unless local communal life can be restored, the public cannot adequately resolve its most urgent problem: to find and identify itself" (1954, p. 216). He argued for the primacy of face-to-face communication because to him "the winged words of conversation in immediate intercourse have a vital import lacking in the fixed and frozen words of written speech [. . .] But it and its results are but tools after all" (p. 218). Dewey nevertheless emphasized the importance of studying the media of mass communications with an effort to improve them because of their importance in complex and urbanized mass societies.

Park proceeded with this project. To him, the *Thought News* incident provided "much of the fundamental theoretical framework through which he came to observe and interpret the flux of events" (Matthews, 1977, p. 23). The experiment spurred him on in the pursuit of his interest in public life and social organization, and after the failure of the *Thought News* project he went to Germany to study with some of the most prominent sociological thinkers of the era, including Georg Simmel (Park, 1972, p. 3). His doctoral thesis, *The Crowd and the Public* (1972) – originally titled *Masse und Publikum* – was submitted in 1904 to the University of Heidelberg and written under the supervision of Wilhelm Windelband. It was a theoretical treatise that sought to understand the formation of "The General Will." Through it, Park distinguished between the crowd and the public as forms of collectivities. To Park, the public is driven by rationality and reason, the crowd by emotion and impulse (p. 80). He thus argued that only "in the crowd does anarchy in its purest form exist. As members of a public, people are at least controlled by the norms of logic" (p. 81). Park's discussion was influenced by prevailing German social thought but also contributed to an understanding of social organization in the context of the formation of public opinion. Park (1941) returned to these themes in a more concrete form toward the end of his career when, in an essay on "News and the power of the press," he highlighted the importance of shared meaning to the creation of public opinion. Drawing on the language of pragmatism, he wrote that "there can be no public opinion, except where there is some fundamental agreement and understanding as to what events, as they happen, are likely to mean, and events have meaning only as one knows what to do about them" (p. 1).

After taking up his appointment at the University of Chicago in 1915, Park wrote a series of articles on race relations and urban sociology, but in all of this work, communication was central. In setting out his research agenda for work on the city, Park (1916) singled out the role of advertising and publicity as forms of social control that could secure efficiency and good government, anticipating research agendas that were later to become so central to mass communication scholars. Park's major work on the newspaper, *The Immigrant Press and Its Control* (1922), advanced, on the basis of empirical research into the widely varied immigrant newspapers in Chicago, the

thesis that the reading of papers in their native languages allows new arrivals to adjust to life in the United States and therefore ultimately operated as a means of integration. Park found evidence to support editors' claims that "their press is not merely a medium for the communication of news, thus initiating the immigrant into American environment, but is likewise a means of translating and transmitting to him American ways and American ideals" (p. 87).

In a later essay on the "Natural History of the Newspaper," Park (1923) spelled out his vision of the newspaper's role in community creation:

The motive, conscious or unconscious, of the writers and of the press in all this is to reproduce, as far as possible, in the city the conditions of life in the village. In the village everyone knew everyone else. Everyone called everyone by his first name. The village was democratic. We are a nation of villagers. Our institutions are fundamentally village institutions. In the village, gossip and public opinion were the main sources of social control. (Park, 1923, p. 277)

Like other Chicago scholars, Park's fascination with urban life was married with a deep-seated nostalgia for small-scale, pre-urban rural communities. To Park and Dewey, in particular, the celebration of such communities – where knowledge was transparent and cultural meanings shared – informed attempts at making sense of rapid social change.

The Chicago School, Mass Communication Research, and Disciplinary Narratives

Park's concern with the media's role in structuring social relations was shared by other Chicago scholars and informed their participation in the famous Payne Fund Studies, which sought to assess the effects of motion pictures on young people at a time of great concern about the vulnerability of audiences and the alarming potential for moral corruption represented by the emerging medium that began to attract significant audiences among the young during the 1920s. It was consistent with the group's interest in using "social science as a weapon" (Jowett, Jarvie, & Fuller, 1996) in outlining and problematizing the central role of motion pictures in US society. The Payne Fund Studies involved Chicago scholars such as Herbert Blumer, Philip Hauser, and L. L. Thurstone. The studies resulted in ten books on the basis of their findings, which were based on surveying thousands of children and youth from 1929 to 1932 (Rogers, 1994, p. 191). Blumer's contribution was particularly influential in highlighting the perceived dangers of movies. As Jowett, Jarvie, and Fuller (1996) point out, "Blumer felt that since Hollywood films were produced outside the circle of the child's moral guardians (home, school, church) [. . .] they held far more potential for bad influence than for good" (p. 79). More than anything, in drawing on scholars from a variety of social scientific backgrounds, the Payne Fund initiative

signaled an emerging methodological and epistemological tension between those, such as Chicago School scholars, who were committed to qualitative modes of inquiry and drew on interviews and life histories and others, most notably psychologists such as Thurstone and Stoddard, who drew on statistical data collection (Jowett, Jarvie, & Fuller, 1996). To Rogers (1994), the Payne Fund research, though heavily involving Chicago scholars known for their qualitative research and symbolic interactionist perspectives, heralded a new age of media effects research based on a more rigorous conception of the social sciences.

However, for the Chicago sociologists, mass media were just part of a complex set of social institutions that shaped human interactions. As Pooley and Katz (2008) put it: "Admittedly scattered, the Chicago School's reflections on communication were fundamental to its broader reflections on social order" (p. 768). Indeed, the relatively broad interests and approaches of the Chicago School are often neglected in accounts focused on identifying it as the ancestral home of symbolic interactionism and ethnographic methodology (Buxton, 2008; Platt, 1995). Here, disciplinary traditions of storytelling have left their imprint on our myths of origins. The diversity of the Chicago School's interests and approaches has often been underplayed because of a neglect of the work of scholars such as Burgess, Ogburn, Thurstone, and Stouffer, as well as the more quantitative strains in the work of key figures such as Park and Burgess. As Bulmer (1984) writes, among quantitative scholars there has been

less desire to examine the roots of the subject and a marked tendency to dismiss the relevance of the history of such methods for present practice. The antihistorical orientation of quantitative methodologies, coupled with the fragmentation of the history of methodology between different disciplines, results in major lacunae. (Bulmer, 1984, p. xv)

Among mass communication scholars, by contrast, much of the impetus in creating disciplinary histories, genealogies, and myths of origin has come from scholars representing the quantitative tradition. Chaffee and Rogers were central to this disciplinary storytelling, basing their accounts largely on biographical approaches, celebrating the work of key individuals who cemented communication as an empirical, quantitative social science. At the same time, such accounts have been inclusive in embracing the Chicago School of Sociology as an influence on the trajectory of the field (Chaffee & Rogers, 1997; Rogers, 1994; Rogers & Chaffee, 1994).

Nevertheless, the Chicago School's "multimethod" approach, combining ethnographic and life history methods with large-scale quantitatively oriented ecological mapping projects to achieve a holistic picture of complex social relations, is gaining increasing recognition (Buxton, 2008; Rogers, 1994, p. 182). In their celebration of the community and their study of the citizens and city institutions that made them, Chicago School sociologists' interests were in the macro-level questions of social organization or *disorganization*. They studied the nitty-gritty textures of urban life,

from the personal letters of Polish peasants to the life histories of taxi dancers, but their ultimate aim was to understand what makes society work. In this focus on larger questions of social cohesion, conflict, and control, they were well equipped for a Progressive Era of reform-minded social science, but their tools were of much less use in tapping into emerging agendas of propaganda and psychological warfare.

Rejection

The rise of a positivist, empiricist approach to the study of mass communication and other social sciences has been widely documented among historians. In the field of sociology, the empirically rigorous, quantitative, and more narrowly focused research projects of the Columbia School of Sociology won a victory over the socially conscious, often qualitative, and normatively inflected approaches of Chicago. As Gusfield (1996) memorably put it, by the postwar years of the late 1940s and early 1950s, "Chicago was an aging giant, only beginning to be conscious that the eastern barbarians had surmounted the gates of their once impregnable midwestern fortress" (pp. ix–x).

This transformation was driven by a range of factors, some of which have been traced by what Pooley (2006) refers to as the "new historians" of mass communication research, among them Glander (2000) and Simpson (1994). Simpson and Glander make similar arguments: In the political climate of the Cold War, the economics of research were increasingly influenced by the largesse of foundations and government agencies with distinctively ideological agendas. As Simpson (1994) argued, the psychological warfare effort of the US government during World War II and beyond shaped the communication research community and determined "which of the competing scientific paradigms of communication would be funded, elaborated, and encouraged to prosper" (p. 3).

After World War II such efforts gradually solidified into funded research projects aiming at perfecting propaganda techniques to win the Cold War (Pooley, 2006, p. 48). Simpson (1994) suggested:

At least half of all the important centers of US communication research depended for their survival on a handful of national security agencies. Their reliance on psychological warfare money was so extensive as to suggest that the crystallization of mass communication studies into a distinct scholar field might not have come about during the 1950s without substantial military CIA and US Information Agency intervention. (Simpson, 1994, p. 53)

While the accounts of Simpson and other "new historians" have been criticized for their often conspiratorial and, particularly in the case of Simpson, openly politically inflected tones (Pooley 2006), they nevertheless provide clear evidence that the political economy of mass communication research had shifted toward encouraging

what Lazarsfeld (1941) referred to as “administrative research” designed to solve particular practical problems in the aid of interested funders. This meant that research on mass communication irreversibly diverged from the normative theorizing of the German scholars who first carved out a path for researching media (see Chapter 25, this volume), as well as from the socially engaged and methodologically eclectic social science of the Chicago School. Pooley and Katz (2008), perhaps somewhat harshly, observed about the emerging dominant field of research on public opinion that “the first and most obvious distinguishing trait was its intellectual fixation on method and technique to the effective exclusion of any overriding substantive concerns” (p. 770). Nevertheless, the Chicago School itself contributed to the “scientization” of the field of sociology and mass communication research more specifically and trained many of the scholars who became defining proponents of the new paradigm (Rogers, 1994, pp. 192–193).

Closely related to and intertwined with this political economic explanation, another version of the eclipse of the Chicago School relates to the rise of communication research as a distinctive and institutionalized discipline. This development was in large part driven by the energetic institutionalizing efforts of Wilbur Schramm. Schramm, who started his career as a journalist and writer, began his discipline-building work at the University of Iowa where, in addition to starting the now legendary creative writing program, he became the chair of the journalism department, founded the first PhD program in communication in 1943, and opened a research center in the area (Rogers, 2004, p. 8). Subsequently, he moved on from Iowa but continued his efforts at opening research-oriented communication programs within already existing journalism schools at prominent universities. First, he started the Institute of Communications Research at the University of Illinois in 1947, then moved in 1955 to Stanford University, where he took charge of the Institute for Communication Research (Rogers & Chaffee, 1994, p. 5). Through the efforts of Schramm and emerging colleagues in the burgeoning field, by the 1960s communication studies had been thoroughly institutionalized as a discipline in its own right, and young scholars interested in mass media (Rogers, 2004, p. 8) now routinely pursued doctorates in communication rather than sociology or other disciplines for which media were a secondary interest.

Incorporation²

Where the received narrative of mass communication research thus tells the tale of an increasing dominance of the Columbia Bureau of Social Research over the Chicago School in the post-World War II era in the discipline of sociology and a growing institutionalization of communication studies in its own right, this is not the only way to describe the shifting power relations and preoccupations of scholars interested in communication.

A little-known episode demonstrates that the preoccupations of some of the remaining figures of the Chicago School of Sociology – Harold Lasswell, Bernard Berelson, Herbert Blumer, Morris Janowitz, Samuel Stouffer, and Louis Wirth – who jumped on board the propaganda ship, following prevailing trends in the field and the ever-shifting political economy of the academy. Starting in 1942, the University of Chicago became home to the first degree-granting program in communication inspired by these concerns. The foundation of the program was spurred by interest in wartime propaganda and spearheaded by a figure who is little known to most communication scholars but central to this story: Douglas Waples, a professor in Chicago's Graduate Library School. In an obituary, Berelson (1979) credited Waples with "the birth of the academic field of mass communications" (p. 1). From the moment he arrived at Chicago in 1928, Waples launched an ambitious program of mass communication research, mostly focused on reading studies but also branching out into radio and film. Waples's expertise in areas relevant to the propaganda effort earned him the job of consultant to the Office of War Information during World War II (Richardson, 1982, pp. 52–54). Under the auspices of this office, Waples participated in the Rockefeller Foundation seminars and worked alongside other key figures in the field, including Lasswell and Schramm. Waples's commitment to the propaganda efforts of the US government before, during, and after World War II existed alongside his belief in the importance of democratic media. His career embodied the dynamic that gave birth to the field of mass communication research. As Berelson (1979) put it, Waples was a "man of peace who spent years of his life in a military uniform" (p. 2).

In late 1941, Waples submitted a proposal to University of Chicago Chancellor Robert Maynard Hutchins for a permanent communication research institute – an institute tied to government propaganda and public relations activities, yet one that could span a range of research areas and disciplines and would be focused on the "clarification of values imputed to typical communications for designated social groups" (Waples, 1941). While Waples's proposal for a full-fledged communication institute failed to gain purchase, Hutchins approved a *committee* on communications and public opinion. The committee was formed immediately for the purpose of providing training and research in the field and was probably the first degree-granting unit in the field of communication.

Beginning in the summer of 1942, the University of Chicago offered courses through the Committee on Public Opinion and Communication to "qualify for professional service a student holding an approved Master's degree in political science, sociology, economics, or other social science" (University of Chicago, 1942, p. 2). The activities of the committee were geared toward the war effort in an attempt to address the government's needs for communication during "different phases of national emergency" (Waples, 1941). However, the committee's schedule of instruction reflected an interest in defining communication research as broadly as possible. The courses ranged from the study of semantics and rhetoric to journalism, law, political theory, urban studies, and the statistical techniques that constituted the

know-how of social science research methods. The committee drew on the courses of scholars who were famous for their methodological knowledge and became closely involved in the World War II propaganda effort, including Herbert Blumer, Louis Wirth, L. L. Thurstone, and Samuel Stouffer.

All courses could be reconciled with the patriotic impulse to educate communication administrators and propagandists. The program of instruction was “intended to train men and women for professional activities in the field, and especially for service with federal and other agencies now undertaking to unite public opinion in full support of the war” (University of Chicago, 1942, p. 1). The committee, designed as a temporary effort, appears to have ended its work at the close of World War II. Waples, however, articulated a vision for a future for the committee that demanded a more sustained commitment to communication research from the university. He suggested that the services of a community of communication scholars would be most useful “if and when the end of hostilities permits formulation of more democratic policies for the administration of press, radio, and film than the monopolistic corporations have thus far been forced to accept” (Waples, 1941, p. 2). Waples thus foresaw a future for communication study closely aligned to questions of democratic media operation but grounded in the problems of persuasion that were so fundamental to the field as he saw it.

Waples remained true to his word and immediately after the end of the war, in September 1945, he wrote Hutchins, suggesting that he would “like to talk over the chance of cross-fertilization between your Freedom of the Press Commission and the sort of research set-up in the public communications and public-opinion field when the war broke it up” (Waples, 1945). Waples recast the activities of the terminated committee in terms of “public communications and public-opinion,” downplaying the close link between the committee and the propaganda work of World War II and setting the scene for a more lasting inquiry into questions of media and mass persuasion.

The Committee on Communication, 1947–1960

Though the membership of the second communication committee overlapped with the first, its ambitions and activities were entirely different. The Committee on Communication was formed in late 1947 with a mission to study problems of mass communication in modern society from an academic and critical perspective and a special emphasis on public communication and international communication. Starting in 1948, the committee offered a two-year master’s program through the Division of Social Science but also initiated a range of research and publishing projects.

The committee attracted a range of individuals who would become prominent in the field. Among those who started their careers in the committee were Elihu Katz,

whose first faculty position was at Chicago, and Morris Janowitz, who was finishing his PhD, teaching on the committee, and conducting research there. Michael Gurevitch and Herbert Gans gained their master's from the committee, which was run by scholars including Waples, Bernard Berelson, David Riesman, and Kenneth Adler. It represented one of the first institutionalized programs focused on mass communication research, and its approach to the study of media was distinctive. In its pursuit of interdisciplinarity, the committee cast its net as widely as possible. It drew on methods ranging from ethnography and textual analysis to survey research and content analysis.

The Chicago scholars interested in communication research concentrated their efforts on understanding the place of media in democratic societies. In 1948, committee member and sociologist Louis Wirth wrote, in tones reminiscent of the Chicago School, that in "mass communications we have unlocked a new social force of as yet incalculable magnitude" that "has the power to build loyalties, to undermine them, and thus by furthering or hindering consensus to affect all other sources of power" (cited in Hardt, 1992, p. 81). As a logical consequence of the committee's antecedents, its emphasis was on long-term research programs to understand the relationship between mass media, power, and social life – a set of interests whose roots could be traced to both the Chicago sociologists and to the wartime propaganda research tradition. At the same time, the committee remained firmly grounded in the approaches that had shaped the wartime research. The committee continued to work on topics of propaganda and mass persuasion in the context of creating a consensus around government policies. For example, Berelson was hired by the Graduate Library School in 1946 on the promise of conducting research on "communications and public opinion on the [atomic] bomb and related issues" (Richardson, 1982, pp. 52–54). The committee received considerable funding from the State Department and the Department of the Army to do research in intelligence and psychological warfare matters (Glander, 2000, p. 164; Janowitz, 1949).

Although the committee was in most respects a product of its times, it also enabled experimentation and innovation in the methods and problems of research. The committee flourished at a time that has been characterized by other historians of mass communication research as the heyday of the quantitative social science paradigm (Hardt, 1992, p. 86). This approach was not, however, shared by the scholars of the committee on communication. For instance, David Riesman, the author of such influential books as *The Lonely Crowd* and one of the first scholars to combine interests in popular culture and psychology, was a key figure on the committee, both as a teacher and as an administrator. He taught the required course on popular culture and is also remembered by students as a mentor for qualitative research projects. However, most students have pointed to Berelson as the anchor of the committee, and it was he who was responsible for what was perhaps the most lasting contribution of the Committee on Communication. Berelson and Janowitz co-edited the committee's *Reader in Public Opinion and Communication* (1950), which became highly influential in defining an emerging field. The majority of this reader consists of work

by University of Chicago communication and Columbia Bureau of Social Research scholars, hinting at the links between the two schools, as well as their prominence in the newborn field. The editors' interest in mass communication research, we learn, was based on "conditions of modern life" such as secularization, industrialization, urbanization, and democratization (Berelson & Janowitz, 1950, p. ix), research questions akin to those asked by Chicago School sociologists (cf. Hardt, 1992, p. 94). As Hardt (1992) pointed out, the Berelson and Janowitz reader

represents an attempt to create intellectual conditions for dealing with public opinion and communication with its bias toward the need to understand theoretical developments, its inclusion of a variety of cultural or historical considerations, and its appreciation of communication not just as a process, but as a necessary condition for the existence and survival of a democratic society. (Hardt, 1992, p. 94)

The central preoccupation with the media's role in democracy was representative of the broadening of interest from the first committee to the second. As the course bulletin for the Committee on Communication proclaimed:

in all its phases communication exerts a crucial effect upon public and private information and insight, upon the capacity for rational decision and action, upon public taste and aesthetic standards, upon moral judgment, upon group loyalty and group disintegration, upon personality development, upon initiation of and adaptation to social change. (University of Chicago, 1950, p. 19)

These diverse interests, which reflected a growing desire to situate communication in its social context, also are evident in another major contribution of the committee. The journal *Studies in Public Communication*, the first volume of which came out in 1957, was founded to publish Committee on Communication seminar papers by faculty and promising graduate students. It offered itself as a publication for cutting-edge research. It was in this journal that Katz first introduced the "uses and gratifications" paradigm as a way of making sense of the relationship between mass media and popular culture (Katz, 1959). As one of the first journals to have the word "communication" in its title, *Studies in Public Communication* represented a much-needed outlet for scholars in the field. It remained inclusive in its interdisciplinary and multimethodological approach. The preface to the third volume introduces the journal as presenting "diverse approaches, both social scientific and humanistic, to the study of the media of public communication [. . .] Among its concerns are studies of popular culture and the mass media, the social structures and the sociological and psychological processes governing media impact, and the political and economic framework within which the media function" (*Studies in Public Communication*, 3, p. i). More than anything, the committee reflected the dynamism and the relative lack of definition of the young field.

At the same time, the University of Chicago School of Sociology continued its investigation in matters of communication, albeit in a broader context. In the

post-World War II era, what Gary Alan Fine (1995) and others have characterized as the “Second Chicago School” gave rise to the symbolic interactionist tradition, often associated with figures such as Everett Hughes, Erving Goffman, Herbert Blumer, and Louis Wirth. Some of these scholars, while not necessarily studying mass communication in their own right, continue to be widely read in the discipline. For example, Blumer’s (1948) essay critiquing the construction of public opinion through polling methods remains a standard reference among political communication scholars today. He called attention to the problems of “sampling with its implicit imagery and logic in the study of a matter which, like the process of public opinion, functions as a moving organization of interconnected parts” (Blumer, 1948, p. 545), recalling the organic conceptions of society underpinning the philosophy of symbolic interactionism. The lasting engagement with Blumer’s critique witnesses a forceful intellectual continuity between the interests of the Chicago School and the preoccupations of those who take a critical approach to conditions of mass democracy. The “rediscovery” of the Chicago School among mass communication scholars has been driven by this continuity and reflects the lasting importance of the ideas that were first articulated around the turn of the twentieth century.

Rediscovery

Indeed, the Chicago School is often central to disciplinary histories, and its work is celebrated as canonical and foundational to mass communication research. For example, its work is included in Katz and his co-editors’ collection of canonic texts in media research (Katz, Peter, Liebes, & Orloff, 2003), where they are identified as one of five foundational “schools” defining the field. Much of the credit for the centering of the Chicago School in disciplinary narratives, however, should probably go to James Carey (Carey, 1992; Munson & Warren, 1997). Carey drew extensively on the work of the pragmatist strand of the Chicago School, reclaiming their work on the role of media in engendering community cohesion as well as the underlying ontology of symbolic interactionism. Carey sums up the importance of the pragmatists in celebrating their

expansive view of an actual social process, an intense interest in its phenomenology, and a historical understanding of how the media of communication enter a ceaseless temporal process of change (rather than a static snapshot of having or not having an effect) is the important but forgotten episode in the standard history of mass communication research. (Carey, 1997, p. 32)

Carey’s much-reproduced definition of communication cast it as the “actual social process wherein significant symbolic forms are created, apprehended and used” (1992, p. 30). On the basis of his affinities with this pragmatist view, Carey has

suggested that we may more helpfully view communication as a ritual. This entails seeing that news “is not information but drama. It does not describe the world but portrays an arena of dramatic forces and action; it exists solely in historical time; and it invites our participation on the basis of our assuming, often vicariously, social roles within it” (1992, p. 21).

Carey’s work has reverberated throughout the ranks of mass communication research, and his ritual view of communication has empowered US cultural studies researchers to take up new research agendas. His work has been taken up in particular by the emerging field of journalism studies. There is an easy affinity and confluence between the work of scholars who take news media seriously – whether in the contexts of production, texts, or reception – and the Chicago sociologists who viewed news, if sometimes overly romantically, as a means of community creation.

More broadly, the Chicago School’s brand of constructionism and symbolic constructionism has reverberated around the world. The tradition of British cultural studies has been profoundly influenced by its theoretical and methodological approach and has contributed to a broader scholarly restitution and popularization of its insights. As Hall and Jefferson (1993) recognized, work by Mead and other Chicago School sociologists influenced the emerging cultural studies approach in its focus on questions of meaning and its emphasis on the experience and agency of social actors.

This tradition included a range of work: symbolic interactionist studies, influenced by G. H. Mead, which attempted to recover the subjective or “symbolic meaning” of action for actors; well-focused, closely observed ethnographic case studies [. . .] and the related methods of participant observation borrowed from social anthropology, which used informants and active participation by the researcher as a means of delineating cultural worlds from the “inside.” (Hall & Jefferson, 1993, p. x)

More broadly, the idea of “representation,” as described by Hall (1997) and others working in the cultural studies tradition, entails the understanding that we construct what we ostensibly describe through processes of representation and that this social construction of meaning has profound ideological consequences. This approach to symbols and their use in the media is so central as to be an implicit and invisible assumption of much work done on media today, absorbed into the language of scholarship.

Mead’s pragmatist approach also has left an imprint on another strain of hugely influential thought in communication in shaping Jürgen Habermas’s theory of communicative action and his development of a discourse ethics (Habermas, 1984, 1987, 1995). Habermas’s project – that of recovering rationality in the structures of intersubjective communication as a normatively desirable framework for social organization – is grounded in Mead’s understanding of symbolically mediated interaction (Habermas, 1987, p. 4). In setting out his discourse ethics, Habermas draws centrally on Mead’s notion of “ideal role taking,” the process by which an individual is able to see a situation from the viewpoint of the “generalized other” and thus is able to

achieve a universalized insight central to the justification of norms (Habermas, 1995, p. 65). The Chicago School, then, has contributed the irreversible understanding that communication matters profoundly and shapes who we are and how we live.

Conclusion

The Chicago School is central to most accounts of the history of mass communication research. But that does not necessarily mean that it has had a profound structuring influence on the work done by most scholars in the field today. Rather, there is a great deal of sympathy for its preoccupations, coupled by a relative neglect of its actual work and methods. Disciplinary histories are weapons of epistemological policing and warfare, determining the way things should be based on the way they have been and are. Mass communication research is like a Rorschach test: It is whatever you see in it and make of it. The disciplinary boundaries of mass communication research are so poorly defined that the choices we make about what disciplinary territory to annex are profoundly normative. Here, I have traced the interconnections between mass communication research and the Chicago School of Sociology, placing the account in the context of prevailing historical narratives. What I have suggested is that although communication was central to the Chicago scholars' theory of society – foundational, as it was, to the symbolic interactionists – the study of media, though a substantial strand of their research, was just one of many avenues for understanding society. In their holistic and often exhaustive and exhausting research projects, Chicago sociologists sought to view communities as living, breathing, and complex organisms that cannot be reduced to their parts and components.

Such a view stood in sharp contrast to the scholarly paradigm that subsequently structured mass communication research, in part a product of wartime and Cold War propaganda efforts and in part the result of the victory of quantitative, positivist social science – a development to which the Chicago scholars themselves contributed. Nevertheless, after 1930, Chicago came to play second fiddle to the Columbia Bureau of Social Research in the disciplinary hierarchy of the sociological discipline. Columbia took a much narrower view of communication, focusing on its effects through quantitative measurement techniques and shaping the subsequent development of sociological research in the United States. At the same time, the institutionalization of communication studies as a discipline in its own right contributed to the eclipse of Chicago as a center for scholarly endeavors focused on the social role of mass media.

Here, however, I have argued that while the dominant narratives of mass communication research convincingly describe the rejection of the Chicago School's concerns and methods, another story that could be told is a more complex one that also involves the incorporation of the Chicago School into the propaganda work of the World War II and Cold War eras and the rediscovery of the school by mass

communication scholars eager to connect with normative and substantive agendas around the role of media and communication in the making of communities and societies.

NOTES

- 1 Though note that Sue Curry Jansen (2009) has suggested that the widely reproduced and received account of a conflict between Lippmann and Dewey is the product of historical reconstruction from the 1980s onward and that, in fact, they represented closely aligned schools of thought.
- 2 This section draws extensively on Wahl-Jorgensen (2004), which provides more details on archival and interview sources used.

Propaganda Studies

The US Interwar Years

Sue Collins

ABSTRACT

The interim between World War I (1914–1918) and the onset of World War II (1941–1945) illustrates the discursive struggle over evolving conceptions of propaganda. Propaganda meant different things to different observers, but for the most part, everyone agreed that its conditions were worth debating, and most people believed that, left unchecked, it posed some kind of threat to democracy. In intellectual, political, and social senses, propaganda became the subject of protracted study and deliberation concerning how best to understand its various incarnations in relation to democratic capitalism. Discourses generating stringent critiques of propaganda's dangers to democracy gradually shifted toward a new focus on mass persuasion and social influence informed by scientific behavioralism and quantitative methodology in relation to media effects. As the field of communication took hold, propaganda's political significance was overshadowed by more apolitical projects, such as public opinion and marketing research, which contributed to the distinction between political propaganda and social influence and the eventual subsumption of propaganda to mass persuasion.

No interim period other than the one between World War I (1914–1918) and the onset of World War II (1941–1945) more critically illustrates the discursive struggle over evolving conceptions of propaganda in the modern age. The word “propaganda” derives from a relatively benign designation in its Latin root, *propagare*, “to propagate,” as in to germinate, or to spread the seeds of the Catholic faith by proclamation of the *Congregatio de propaganda fide* (Office for the Propagation of the Faith) in the seventeenth century. The practice of propaganda as a political concept is much older, of course, than the word used to describe it, dating back to techniques of persuasion characterized by ancient Greece and the beginnings of mass communication systems employed by the Roman Empire (Taylor, 1990). The “idea” of propaganda, as opposed to the actual workings of the phenomenon itself, is the primary focus of this chapter during the interwar years when critics, scholars, practitioners, and ordinary people alike considered what this ostensibly new form of mass persuasion meant for US capitalism, democracy, and world peace. Propaganda as a political tool or technique predates World War I, but what matters about this context is that people became aware of it in a new light for the first time during the war and, more saliently, during the interwar years. In other words, propaganda itself was not new, but public awareness of its ostensible impacts was.¹

In the postwar context, propaganda meant different things to different observers, but for the most part, everyone agreed that its conditions were worth debating, and most people believed that, left unchecked, it posed some kind of threat to democracy’s health. In intellectual, political, and social senses, propaganda became the subject of protracted study and deliberation concerning how best to understand its various incarnations in relation to relative conceptions of democratic capitalism. This question came under fire at the end of World War I when progressive intellectuals deeply troubled by the apparent manipulability of public opinion by special interests confronted competing perspectives about what propaganda’s utility was and what its impacts were or could be in relation to a host of positions: practitioners of free enterprise, positivist social scientists, government bureaucrats, and advocates for a pragmatics of better and ethical communication. Throughout the 1920s and the 1930s, the common connotation of the word “propaganda” was pejorative, and the idea of propaganda generally was considered disturbing, even as it was subject to dissections of its *modus operandi*. However, discourses generating stringent critiques of propaganda’s dangers to democracy gradually shifted toward a new focus on mass persuasion and social influence informed by scientific behavioralism and quantitative methodology in relation to media effects (Sproule 1987, 1997). In some ways, as the field of communication took hold, propaganda’s political significance was overshadowed by more apolitical projects, such as public opinion and marketing research, which contributed to a distinction between political propaganda and social influence and the eventual subsumption of propaganda to mass persuasion. The objective in this chapter is not to uncover some “true” or definitive definition of the word “propaganda” but rather to highlight the historically specific struggle that ensued over claims about what propaganda was and how it operated and, more

significantly, assertions over what should have been both the popular and the policy response to propaganda in the interwar years. But to understand the ideological import of propaganda during this time, we must make a brief foray to the critical prewar years and World War I.

Progressivism, Publicity, and the Committee on Public Information

The stakes over the uses of propaganda became especially clear in the immediate postwar context when its *raison d'être* was subject to intense scrutiny and debate. The critical paradigm, as Sproule (1987) refers to it, began when the progressive faith in the faculties of the intellect to resist human folly was displaced by widespread disillusionment over world war and the possibility of rationality acting as an antidote to stop it. But the roots of propaganda's postwar angst lay in the social and political critiques of the muckrakers and the Progressive movement; the intellectual currents of crowd psychology and Freudian theory; and the appropriation of the Progressives' beloved concept of publicity, first by industry, then by the US government's campaign to wage support for war.

From the late nineteenth century and through the great reforms of the early twentieth century, urban liberal reformers made productive use of *publicity*, a mechanism that could hold up the inequities and injustices of a chaotic and unstable industrializing nation to shameful illumination. The idea of publicity, Ewen (1996) points out, held a historically specific connotation, "understood as a crystalline light by which an unraveling society and its toxic contradictions might be illuminated and brought to order" (p. 48). Relying on the idea that an enlightened bourgeois public would be activated given verifiable material facts, muckraking journalists thus put to task their investigative and narrative skills in great national exposés of social documentation to incite what they hoped would be a reform-minded response worthy of a great democracy. Progressives held faith in the rational individual, whose actions were dictated less by impetuousness than by reasoned argument facilitated by knowledge carried on the wings of publicity. One only needed to make the facts widely known to effect social change on behalf of the poor and working class. This aggregate of individuals and beneficiaries of the paternal bourgeois public was conceptually positioned between the poles of a potentially dangerous crowd prone to mob-like incitement and a fragmented mass susceptible to social persuasion. In this light, publicity, along with a new-found conviction in the powers of social engineering, compelled several intellectuals, social scientists, and reform workers to "indulge the illusion of progressive fulfillment" as they valorized the new bureaucratic structure in search of a means for social control and order (Wiebe, 1967, p. 222).

This thinking became tenuous as the rise of mass communications challenged the progressive project with an increasingly commercial agenda and as progressives

re-evaluated social class and human behavior in light of competing formulations of crowd psychology. On the one hand, the power of publicity as a muckraking tool used to galvanize a national public around vital social issues was immense. In the process, the new journalism gave rise to propaganda analysis, which Carey (1995) describes as “the unmasking of attempts by interests groups to control and manipulate the press [. . .] aimed at provoking public action rather than theoretical reflection” (p. 388). On the other hand, the public became the problem of the mass, defined “increasingly by its vulnerable condition of isolation and spectatorship” produced by the new mass media, which put it at risk of ideological manipulation (Ewen, 1996, p. 56). The public, then more broadly defined, seemed potentially unruly under the strain and uncertainties of modernity, yet it could be rendered passive by its fragmentation and diffusion. Social institutions of communication such as the burgeoning professions of public relations and advertising recognized that strategies for managing Le Bon’s irrational crowd, Trotter’s herd, or Freud’s unconscious desire were needed to rationalize public opinion, which, so it seemed, could also be put to work to “make the world safe for democracy.”

When the European powers entered into the Great War in 1914, the idea of propaganda had not yet been linked with these seemingly benign civilian professions. Rather, propaganda had been the political currency of government. But as publicity could be deployed to make known the horrors and abuses of modern living under the dominance of the trusts, so too could individuals sympathetic to the needs of big business appropriate its vigor to amplify their cases. Increasingly, publicity became an institutionally organized apparatus defending the interests of the powerful in the tug for public opinion. Upon entrance into world war, belligerent governments were not remiss in seeing the advantages of having well-organized information bureaus to disseminate their propaganda, but initially, at least, clear distinctions between publicity and propaganda were not pronounced. Propaganda as a form of “geopolitical name-calling” came during and after the war when for the first time people became aware of and alarmed by its efficacy in the service of state power (Gary, 1999, p. 9). In the US public mind’s eye during the war, however, propaganda was primarily associated with Germany and German violence because British and US propagandists made it so.

Mark’s (1957) work, for example, shows how a negative perception of propaganda came to be associated with underhanded activities by Germany to win US public opinion during US neutrality. Early in the European war, US journalists vociferously countered the propaganda of German–US alliances and worked to link the activities of such groups to US neutrality law violations by the German government. The release of the so-called “Albert letters” contributed in no small measure to the intensity with which the public became interested in propaganda and would summarily adopt its negative connotation. Having fallen into the hands of a US agent, these papers were published in the *New York World* with sensational headlines promising to expose the extent of “German propaganda,” which readers undoubtedly found shocking. Marks (1957, pp. 5–8) argues that alleged German offenses such as buying

newspapers to control news, agitating for strikes in munitions plants, lobbying for arms embargos, and setting bombs on ships and destroying canals surely contributed to war propaganda hysteria and successfully linked German propaganda with conspiracy, espionage, and violent sabotage in the public's mind for the duration of the war and long after. Moreover, anti-German US writers and political elites actively infused the public with the idea that German propaganda was not only insidious but covertly invasive, having targeted US citizens before the war through the "psychology of suggestion" (Marks, 1957, p. 10). Thus, the association of propaganda with Germany alone and the linking of the term with acts of criminal violence as well as the attempt to influence public opinion "were both reasons for not liking Germany and for not liking propaganda" (Marks, 1957, p. 15).

Britain, of course, was also competing over winning US public opinion at the start of the Great War in Europe. The British, however, were largely successful because they had targeted and won the support of US opinion leaders well before the United States entered the war (Lavine & Wechsler, 1940). The Wellington House War Propaganda Bureau intended its propaganda campaign to reach foreign elites not through the overt and mass methods characteristic of the German propaganda ministry but through a disguised and indirect campaign that targeted important people in positions to influence others. The British policymaking elite was accustomed to the personal appeal in British diplomacy with foreign elites and generally was not familiar with or skilled at the business of manipulating mass popular opinion. It also was assumed that political elites would resent the efforts of any foreign government in trying to sway the thoughts and behavior of its populace without its sanction. For the first three years of the war, the British strategy cautiously avoided overt propaganda in its overseas campaigns,² which "was not simply a device to prevent clean hands from getting dirty but the product of a genuine belief in the value of disguised and indirect propaganda" (Sanders & Taylor, 1982, pp. 101–102). Pamphlets and articles written by famous British writers, for instance, were attractive to US publishers and were less likely to be traced back to the British government as its source.

In the United States, the extensive use of propaganda as an instrument and strategy of state power is explained, in part, by the marshaling of the liberal thinkers who had conceived of publicity as a progressive tool (Vaughn, 1980). When President Wilson was faced with the task of persuading a reluctant public to support an interventionist war, progressive intellectuals wrote him about the need for an infrastructure to mobilize public opinion on a widespread scale. In 1917, Arthur Bullard wrote a treatise arguing that the United States should avoid the errors of the European nations' decision to censor war propaganda. Rather, the United States needed to provide an open statement as to why isolationism was to be abandoned and an infrastructure for mobilizing public opinion in the government's favor should be instituted. What was needed was a publicity campaign that would make the call to arms "definite and explicit" and would serve as "a ringing inspiration" to the average US citizen asking, "What can I do?" (Bullard, 1917, p. 35). In this appeal to Wilson, Bullard suggested setting up a non-partisan publicity bureau. Relying on the benevo-

lence of publicity, the idea would be to relentlessly publicize the needs of the nation and the activities proffered by US citizens serving their country by requisitioning space on the front page of the newspapers, thus calling to service a “draft” of trained writers to feed “army stories” to the public and to enlist a corps of press agents, poets, and publicists at home and abroad to aid the campaign (pp. 42–43). It was imperative to stimulate robust public opinion, Walter Lippmann also argued, by controlling deceit while also not suppressing truth. War could achieve the objectives of peace if done so properly, which was to say that the question of censorship should be handled not by the military but by civilians whose democratic proclivities would have the insight to disseminate information wisely (Vaughn, 1980, pp. 5–6). In March 1917, Lippmann submitted a memorandum to presidential advisor Col. Edward House offering a rationale for abandoning neutrality and a set of ideas for how to mobilize public opinion.³

On the heels of advice from progressive intellectuals and his war secretaries, Wilson instituted the Committee on Public Information (CPI) in April 1917, one week after Congress declared war on Germany. He appointed former muckraking journalist George Creel to head the bureau (which also came to be known as the Creel Committee). Despite its improvisational start,⁴ the scope of the CPI rendered it into an unprecedented ministry of propaganda to sell war, “a gargantuan advertising agency the like of which the country had never known,” comprising an array of activities unparalleled “until the rise of totalitarian dictatorships after the war” (Mock & Larson, 1939, p. 4). Despite what became the CPI’s questionable means to an end, it was able to attract leading progressives who sincerely felt that the European war threatened democracy; thus, they aligned themselves with the state publicity bureau while holding a “naïve faith in the integrity of the American government and its leaders and in the power of ideas to transform men and society” (Vaughn, 1980, p. xii). It was also the case, Vaughn points out, that “propaganda” did not yet have the negative connotation that it earned from the fervor with which the CPI did its work, nor did the intelligentsia of the time witness the abuses of later propagandists. As well, Kennedy (2004) notes, a number of nationally known socialist intellectuals may have anticipated the setbacks pro-war sentiments would afflict on the party⁵ and so they “sought refuge in the Wilson administration’s welcoming embrace,” hoping they might also “use the war emergency to further the socialist cause” (p. 27). Yet, by condoning the paradox of what became his administration’s legacy in the manipulation of public opinion, Wilson adopted policies that would enforce loyalty through repressive measures on the one hand and would enact state censorship without seeming to do so on the other.

In charging Creel with the task of galvanizing public support for war, Wilson put his faith in Creel’s determination to implement policy in which censorship and publicity could coexist in such a way that the former would be “voluntary” and the latter would, as Mock and Larson (1939) put it, choke all channels of communication with officially approved information, “leaving little freeway for rumor or disloyal reports” (p. 11). Creel believed that some policy of censorship would be needed, but he

resolved it could be attained without the heavy price of formal law; rather the bureau would rely on the “aroused patriotism” of his professional colleagues (Creel, 1920, p. 16). In his unabashed postwar memoir of CPI history, Creel (1920) called the committee’s mission “the world’s greatest adventure in advertising” (p. 4) as he praised the stockpile of notable contributors: renowned scholars, journalists, writers, and novelists for writing pamphlets, news articles, and stories; famous artists and cartoonists for designing posters and other artwork; film professionals for their work with the Signal Corps, the CPI film division, and the commercial industry; prominent national figures in politics, the military, and foreign relations for their speaking contributions; and an army of some 75,000 Four Minute Men speakers for saturating local communities nationwide with upwards of a quarter of a million patriotic speeches.⁶ These materials, Creel (1920) wrote, “became an arsenal from which speakers and newspapers drew whole batteries of speeches and editorials and special articles,” filling the pages of “privately published patriotic collections” and “widely used text-books in history and civics” (p. 109).

Linking the CPI with publicity and the German campaign with an increasingly vile perception of propaganda – that is, the domain of lies and deceit, but especially violent misdeeds – crystallized the distinctions among white, black, and gray propaganda that were well recognized by the time of World War II.⁷ Writing in the *Scientific American* in April 1918, Creel (1918a) devoted an article to the German “campaign of lies.” Three months later, in *The Annals of the American Academy*, Creel (1918b) explicitly distinguished the US approach from its adversary by positioning US propaganda as if it were a form of public diplomacy (on the basis of its openness) rather than psychological warfare:

Much has been said in praise of German propaganda, but from the first our policy has been to find out what the Germans were doing, and then not to do it. Rottenness and corruption and deceit and trickery may win for awhile, but in the long run it always brings about its own inevitable reaction. What we are doing in foreign countries is being done openly. What we are trying to do is to bring home to them the meaning of American life, the purposes of America, our hopes and our ambitions. (Creel, 1918b, p. 190)

In sharp contrast to the transparent magnanimity of the CPI’s foreign and domestic campaign, Creel alleged that Germany and Austria promised imprisonment and execution for their citizens if caught in possession of CPI literature that had been smuggled across enemy lines (Creel, 1918b, p. 185). On the home front, Creel insisted, the CPI’s efforts relied on direct presentation of educational and informative facts. This strategy, Creel boasted, worked to fight intolerance, indifference, and ignorance without concealment or repression. It relied on inspirational appeals to the intellect that would move people “through their minds, rather than their emotions” and with “unanswerable arguments that would make every man and woman know that the war was a war of self-defense that had to be waged if free institutions were not to perish” (Creel, 1920, p. 100).

Notwithstanding Creel's imagined sense of the CPI's mission, the repressive impacts of the committee's patriotic zealousness spread far and wide, and it was dogged with controversy throughout its tenure, prompting Henderson (1969) to call the CPI the "true progenitor of the USIA" (pp. 23–24). The patriotic fervor with which the CPI instituted its objectives worked to squelch dissenting opinions through emotional appeals designed to foster a climate of fear and hatred. Opponents of war, voices of conscientious objection, and pacifists became subject to the severe local harassment of vigilante groups or more formal punitive measures ensured by the Espionage and Sedition Acts. US citizens who openly objected to war or those who did not vigorously support the war were subject to intense scrutiny and made to prove their loyalty. Some cases of vigilantism were state-sanctioned, such as the unruly surveillance activities of the American Protective League, whose members, with the tacit approval of Attorney General Thomas Gregory, conducted "slacker raids" involving physical assaults on people deemed to be dissenters. To speak up for the rights of immigrants and labor in this atmosphere of patriotic fervor was "to risk being persecuted for disloyalty" and "to criticize the course of the war, or to question American or Allied peace aims, was to risk outright prosecution for treason" (Vaughn, 1980, pp. 88–89). The committee's view toward labor, Ross (1996) argues, was the catalyst to "an exploding national intolerance of political dissent" that left an indelible mark on the Cold War sentiment starting in 1918, not 1945" (p. 23). Combined with the "loose" interpretation of the Espionage Act, the labor movement was conveniently crushed and domestic dissent was subsumed by a jingoistic national mood. The "majority's acquiescence to the draft and the war," Zinn (2005) argues, "was achieved by shrewd public relations and by intimidation – an effort organized with all the power of the federal government and the money of big business behind it" (p. 368).

In the wartime climate of fear and recklessness, the US Justice Department actively complied to keep dissenting opinions out of the public sphere. In retrospect, Gary (1999) notes, this had to do with the emerging recognition of propaganda as invasively dangerous to democracy, requiring some measure of inoculation. People, it seemed, needed to be protected from German propaganda or any speech that could be conveniently deemed "un-American" during a time of national crisis. By the war's end, the Justice Department successfully convicted about 900 prosecutions out of the 1,956 cases brought before it. Almost all of the convictions rested on evidence that treated opinions about the war as statements of facts that were condemned as false because, as First Amendment scholar Zechariah Chafee noted, "they differed from the President's speech or the resolution of Congress declaring war" (Gary, 1999, p. 186). Hostile discussion to the idea of war was hence unprotected by the Constitution. In trying to explain the climate of excess during the Great War when looking back on the eve of the next one, Chafee, along with other postwar scholars and intellectuals, blamed "propaganda as the chief culprit" (Gary, 1999, p. 186).

Postwar Discourses: From Critique to Application

The idea of propaganda decidedly shifted in the postwar public imaginary. Although the CPI and the British propaganda apparatuses had successfully convinced a nation of US citizens that Germany and the Central Powers had committed war crimes, the discovery that the US public had been the target of British propaganda – and that all the combatants had used and abused propaganda to suit their interests – forced the purview on propaganda to change; it was now popularly conceptualized as “all lies.” Postwar publications such as Will Irwin’s *An Age of Lies* (1919) reassessed the distorted arguments leading to war, Sir Campbell Stuart’s *Secrets of Crewe House* (1920) detailed the scope of British propaganda operations, and Charles Hunter Hamlin’s *Propaganda and Myth in Time of War* (1927) revealed the entangled financial relationships among US bankers, industry, and Allied governments. Hamlin’s indictment of the CPI was unequivocal, calling it “the greatest fraud ever sold to the public in the name of patriotism and religion” (Hamlin, 1973a, p. 92). Similarly, Arthur Ponsonby’s *Falsehood in Wartime* (1928) exposed such widely circulated atrocity stories as the German “corpse factories” and the “Belgium babies” of the British Bryce Report as either patently false or simply unsubstantiated in any credible way. Even the German U-boat sinking of the passenger ship *Lusitania*, which was used in part to justify the US entrance into the war, turned out to be an armed ship carrying munitions and other contraband. Indeed, the atrocity story “became a piece of evidence in the belief that ‘propaganda’ was synonymous with ‘lie,’ a further evidence that the American public had been terribly deceived, as well as the explanation of how and why Allied propaganda had been so shockingly effective” (Marks, 1957, p. 44). The discovery of British and other Allied propaganda consequently focused the spotlight on US propaganda. But, Marks (1957) argues, the issue was much less about the casualty of truth than it was the “shock” that hit when “it became clear that propaganda was a force capable of *conquering the learned* with as much ease as it conquered the average man” (p. 45). To be sure, war hysteria left few educators⁸ outside its path (Angoff, 1927; Grattan, 1927; Hamlin, 1973b). Consequently, propaganda was perceived as a new kind of omnipotent and insidious force.

Critical suppositions about propaganda’s effects in the war’s immediate aftermath attached themselves to a new perception of the public as a modern mass incapable of discerning rational argument, or at least rendered defenseless when victimized by nefarious machinations of propaganda. “The cruelest damage,” Kennedy (1980) argues in relation to the progressives’ postwar change of attitude, “was visited on their very social philosophy, their most cherished assumption about the reasonableness of mankind, the malleability of society, and the value of education and publicity as the tools of progress” (p. 90). The irrationality once ascribed to the working class, to Le Bon’s irrational crowd at the turn of the century, appeared to be “the habitual filter through which human nature, in its most general terms, was understood” (Ewen, 1996, p. 144). This formulation, as Ewen (1996) shows, involved multiple

renditions. Gabriel Tarde, for example, had suggested that the crowd, when dispersed through the mechanisms of modern communication, lost the contagion that made it unruly and thus could be controlled. The association of people in mobs and the “herd instinct” that governed them was inevitable, claimed Wilfred Trotter, making people susceptible to leadership. Following Le Bon’s understanding of the crowd as a productive part of the cyclical rise and decline of civilizations, US sociologist Robert Ezra Park argued that the crowd was a necessary phase in the evolution of institutions and in the birth of social movements, in particular (Leach, 1986). The crowd also held out the promise of its manageability *because* it lacked culture and a stable social structure (p. 105). The public was theorized as dispersed and anonymous, united not by physical proximity or interaction but by an imagined sense of community, which made it interesting from the perspectives of both psychology and business marketing.

As collective behavior underwent conceptual transformations (involving crowd, mass, market, and public), so too did viewpoints on the best way to understand propaganda. In the 1920s, the progressive critique dominated the discourses on propaganda, which characterized it writ large as a menace to society. However, social scientists who took an interest in the study of social influence and public opinion formation more broadly construed began to shift the emphasis of inquiry from humanistic critique to scientific analysis. All the while, the problem of whether the public could protect itself from the authority of propaganda remained at the forefront of concern.

For Walter Lippmann, the answer to this question was, categorically, no. Having been disturbed by the successes of war propaganda and by his role in the “engineering” of public opinion during the war, Lippmann decried propaganda’s abuses in a democratic state. For Lippmann (1920), propaganda was an “increasingly disserviceable mechanism” with few virtues, which had been separated out and given another name such as “advertisement” or “advocacy” (pp. 49–50). The focus for Lippmann, however, was on what he identified as the problem of democracy and its relation to public opinion in the modern age of communication. This had to do, in large part, with the unreliability of the press to inform the public, particularly when the stakes for winning public opinion had become critical to institutional power. Lippmann made this case in three essays published in *Liberty and the News* (1920).⁹ The project of liberty in a democracy required the uninhibited flow of information. In the first place, the news functioned to ensure the veracity of information, but it was also necessary to make it comprehensible to people because most people live in the “pseudo-environment of reports, rumors, and guesses,” what Lippmann (1920) considered the detritus of second-, third-, and even fourth-hand information, preying off comfortable “prepossessions” in the face of unmanageable complexities of “assertion and propaganda” (p. 55). Taking up the question of propaganda directly, Lippmann argued that because journalists had turned to their consciences to decide what to publish during the war, news had consequently become confused with propaganda. Lippmann conceived of liberty, in contradistinction to propaganda, as

a robust environment conducive to inquiry and judgment, optimally in service to society. "Without protection against propaganda," Lippmann (1920) insisted, "without standards of evidence, without certain criteria of emphasis, the living substance of all popular decision is exposed to every prejudice and to infinite exploitation" (p. 63). Thus, "there can be no liberty for a community which lacks the information by which to detect lies" (p. 64).

The press, however, was only part of a bigger problem. In his influential book *Public Opinion*, Lippmann (1922) framed the issue epistemologically: people, including journalists, know the world not as it is but as the "pictures in our heads" represent it. In the struggle to make sense of reality, imagination precedes experience. The inescapable human propensity to stereotype combines with a store of cultural preconceptions and prejudices, intentional censorship, and the compression of complex information to digestible messages, to limit access to the facts of the world outside the pseudo-environment. The intentions of self-interested parties complicate this relationship to the point of risking representative government, given the public's perceptual cognitive deficit in deciphering politically motivated distortions. In short, the public was too easily incapacitated by propaganda's quotidian exploits, and thus susceptible to the "manufacture of consent" (Lippmann, 1949, p. 248). In effect, Lippmann debunked the very premise of the omniscient citizen central to a functioning democracy and called for the institution of an expert class – equipped with specialized knowledge to operate on behalf of the public – to wade through and clean up the muck obscuring perception and access to facts.

Herein lay the solution to propaganda's threat to democracy: "the 'technic' employed by scientifically trained and disciplined policy experts" (Gary, 1999, p. 31). Only it wasn't so clear, as Gary (1999, pp. 31, 33) suggests, whether Lippmann thought the technocratic elite itself would be exempt from propaganda's mesmerizing effects. In any case, Lippmann's instrumentalist theory of expert-driven democracy lent legitimacy and credence to the imminent paradigm shift to positivist social science, despite what Jansen (2008) refers to as Lippmann's "cosmopolitanism" and his deep commitment to the ideals of his mentor, Graham Wallas, and his "Great Society."¹⁰

Propaganda was a threat to rationality, the prerequisite to a functional democracy, but it also had utility as an instrument of manipulation expedient to government, especially when the managing of consent was construed as necessary, as in crisis: "The necessity is often imagined, the peril manufactured. But when quick results are imperative," Lippmann (1922) proposed, "the manipulation of the masses through symbols may be the only quick way of having a critical thing done" (p. 236). Propaganda warranted study to dissect its mechanisms so that it could be made to work for society. Underscoring its radicalness, Gary (1999) notes that Lippmann's position was "a powerful and profoundly elitist idea, one that argued for expert-driven politics, a politics of manipulation, a politics of empty symbols, a politics bereft of an active and self-interested public" (p. 33). Similarly, Carey (1995) argues that Lippmann's expert-centered policymaking apparatus "took the public out of

politics and politics out of public life, depoliticizing the public sphere” (p. 390).¹¹ Indeed, by the time he wrote *The Phantom Public* in 1925, Lippmann’s estimation of the public diminished to the point of referring it to as a “mere phantom,” that is, to an abstraction residing outside political activity as bystander or spectator, unable to anticipate or comprehend the critical issues of a democratic state.

Lippmann’s instrumentalist prescription for salvaging democracy in the age of modern communications prompted John Dewey to challenge his indictment of the public. “It is not that there is no public,” Dewey wrote in *The Public and Its Problems* (1927), but that the public was “too diffused and scattered,” easily distracted by rival interests, and disposed to habits of thought that were conditioned by culture and society (pp. 137, 158). Although Dewey agreed that propaganda was problematic for democracy, he argued that the problem was less the fact of propaganda than the “emotional habituations and intellectual habitudes on the part of the mass of men [that create] the conditions of which the exploiters of sentiment and opinion only take advantage” (p. 169). The state of mass society warranted concern because the public was kept scattered by the diversions of mass entertainment and consumerism, fodder for the ad men and public relations specialists. Indeed, he agreed that hired hands for publicity in the service of government was antithetical to democracy, but the solution was not expert paternalism; rather, it was “the improvement of the methods and conditions of debate, discussion and persuasion” (p. 208). Dewey thought Lippmann’s expert class could not be counted on in lieu of the public; what was needed was for intellectuals to bring the public back into the project of democracy. The best way to do this involved better communication through education and inquiry, combined with unfettered flows of ethical uses of publicity. Thus, for Lippmann, “democracy rose and fell with the intelligence of the masses,” while Dewey insisted that “the widespread debunking of popular intellectual capacities by democratic realists was not a conclusive sign of the innate incompetence of the masses but a failure to achieve meaningful forms of public participation” (Peters, 1989, p. 212). Lippmann treated postwar publicity and propaganda as companion adjuncts to political power, but Dewey held on to publicity as the early progressives imagined it – as the free flow of expression and information, which, if employed at the local level of community, could be part of the solution to propaganda.

The flipside of the progressive critique belonged to the public relations professionals, who forwarded arguments in defense of the field in the wake of the Great War. One such apostle was former CPI official Edward Bernays, who in 1923 published *Crystallizing Public Opinion*, a practitioner’s perspective on the growing profession of public relations and management of public opinion. Influenced by Trotter’s ideas on the malleable crowd and Lippmann’s thoughts on managing public opinion, Bernays’s exposition was a clear attempt to neutralize the profession’s association with “that vaguely defined evil, ‘propaganda’” (Bernays, 1923, p. 12). Recalling the prewar progressive enunciation of publicity, Bernays resituated the publicity man as the “public relations counsel” whose talent included honed intuition and the application of a

wide range of psychological measures to assess the public mind. In short, the public relations consultant was an indispensable service to US capitalism and democracy, “ideally a constructive force in the community” whose work was derived out of responsibility to the public of individuals and institutions (p. 57).

Bernays (1923) agreed with the progressive critique insofar as he thought mass society posed new challenges to social organization requiring social engineering by experts. Propaganda was necessary to combat the predispositions of the common mind. Ideas did not exist in isolation but were formed by “precedent authority, habit, and all the other human motivations” (p. 97). Stereotypes could be reinforced or contested, or new ones could be created as a means to desirable ends. Moreover, people were subject to the herd mentality, so propaganda used effectively worked to overcome “the censorship of the group mind and herd reaction” (p. 122). On this point, Bernays took issue with Lippmann’s assertion that propaganda relied on censorship by equivocating on the term. Bernays claimed that from his professional perspective the opposite was true. Propaganda was a purposeful attempt to get the individuals to surpass the censorship of their own minds – their “logic-proof compartments” that precluded them from “seeing in terms of experience and thought rather than in terms of group reaction” (p. 122). The PR counsel’s important function was to “understand and analyze obscure tendencies of the public’s mind” and to create the symbols that appeal to “instinct and universal desires,” which will bring about the desired response (p. 173). Thus, knowledge of individual and group psychology was imperative to the business of public relations.

Bernays (1923) declared propaganda a neutral mechanism by reducing the question of whether it was good or bad to a dependency on the merit of the cause and the accuracy of the information used to further it. One person’s notion of the public conscience was another’s ascription of sinister propaganda, depending upon whether one’s disposition was in or out of “sympathy with the accepted point of view” (p. 70). “The only difference between ‘propaganda’ and ‘education,’ really is the point of view,” Bernays claimed. “The advocacy of what we believe in is education. The advocacy of what we don’t believe in is propaganda.” (p. 212) Nothing prevented propaganda from serving the demagogue’s intent on pulling the wool over the public’s eyes. But, if the industry held itself up to the moral standards proposed by Bernays, if the public relations counsel scrutinized his actions, if he premised his actions with truthfulness and accuracy, then he would avoid propagating harmful or “unsocial” ideas (p. 215).¹²

Many of the assertions made in *Crystallizing Public Opinion* are repeated in *Propaganda* (1928), but here Bernays took on the word “propaganda” directly in an attempt to normalize the concept in the public’s mind and to win approbation of its routine use. As Miller (2005) points out, “*Propaganda* is primarily a sales pitch, not an exercise in social theory” (p. 17); consequently, its goal was to reach potential corporate clientele. In this volume, Bernays distanced “the new propaganda” from wartime propaganda gone awry and justified its employment as a natural technique amenable to the development of peace.¹³ An apologist for capitalism, Bernays detailed

propaganda's wonders when put to work servicing business, but he also included sections on political leadership, women's activities, education, social service, and art and science.¹⁴

Neutralizing the Menace: Social Science and the Behavioral Approach

Bernays's supposition declaring propaganda's neutrality was famously reiterated by social scientist Harold Lasswell, who at one point compared the morality (or immorality) of propaganda to a "pump handle" (Lasswell, 1928). His first book, *Propaganda Technique in the World War* (1927a), decidedly sharpened the focus of propaganda with a social scientific lens, and his name became most notably associated with propaganda as an object of study within political science, although his background with the Chicago School of sociology reflected broader interests. Having been influenced during his doctoral work by political scientist and former CPI official Charles Merriam, Lasswell wrote his dissertation on the content and techniques employed by the major belligerents of the Great War, which "seemed to place him at the driving center of the social and intellectual movement to study mass persuasion" (Sproule, 1997, p. 49). Lasswell's book may have seemed in some ways like an addendum to the progressive critique because he was critical of the abuses of propaganda to serve self-interest from all sides, but his larger treatment is framed more as a disinterested, if not prescriptive, account of the necessity of propaganda in modern large-scale warfare. In fact, Gary (1999) argues, the most distinctive aspect of Lasswell's work was his "insistent distancing of his objective analysis from the war generation's moral outrage about propaganda" (p. 61).

In the first place, Lasswell (1927a) showed how all the belligerents used propaganda in ways that would mobilize their civilian populations to their own ends, most egregiously using atrocity stories to instill hatred for the enemy and outright lies to demoralize the enemy. But he also rejected the predominant contemporary critique of propaganda. He argued that propaganda was not inherently mysterious, cunning, or noxious. Rather, when considered systematically, which he did, propaganda could be shown to be a rational and expedient endeavor in the measurement and formation of public opinion, which during wartime "calls forth the most strenuous exertions" (p. 8). Defined as the "direct manipulation of social suggestion" using "significant symbols" such as "stories, rumors, reports, pictures and other social communication" (p. 9), Lasswell maintained that propaganda's success depended on mobilizing the civilian population with particular uses of propaganda which, in turn, depended on the extent to which the propagandist understood the limits of the targets' predispositions in perception and behavior. Although he did not use the term, later communication scholars associated Lasswell's attribution of propaganda's power with the so-called "hypodermic needle" model of direct media effects (Chaffee & Hochheimer,

1985; Lubken, 2008), against which “limited effects” experimental research would take shape (see Chapter 29, this volume). Lasswell’s (1927a) comment that “propaganda is one of the most powerful instrumentalities in the modern world” (p. 220) overshadowed his attention to the social forces circumscribing its success given the large body of critical and empirical work on propaganda to which Lasswell contributed and the uncertain implications of the new media environment dominated by mass media.¹⁵

Pushing conceptions of its hazards aside, Lasswell (1927a) positioned propaganda as but one of three critical elements to be used by any country interested in winning a war, alongside the coercive pressure of the military and the economic pressure of access to war resources. Illusion, however, was better than coercion and this could be accomplished most efficaciously through social manipulation, so great were the “psychological resistances to war in modern nations” (p. 47). As a technique of warfare, propaganda held no privileged purview; it could be used to lie and all historians and “seekers of truth” wrote respective histories blaming the enemy (p. 53). Accordingly, Lasswell refused to blame the medium for the ends to which propaganda might be put. Rather, his treatment justified its various uses (and abuses) as unavoidable or inevitable and with a certain agency of its own: “the wolf of propaganda does not hesitate to masquerade in the sheepskin. All the voluble men of the day – writers, reporters, editors, preachers, lecturers, teachers, politicians – are drawn into the service of propaganda to amplify a master voice” (p. 221).

This argument was equally if not more salient with respect to peacetime. In an article for the *American Political Science Review*, Lasswell (1927b) defended propaganda as a necessary adjunct to the Faustian bargain of democracy: “Most of that which formerly could be done by violence and intimidation must now be done by argument and persuasion. Democracy has proclaimed the dictatorship of palaver, and the technique of dictating to the dictator is named propaganda” (p. 631). Selectively borrowing from Lippmann, Lasswell considered the manipulation of symbols as imperative to social control and the inhibition of violence. Expanding on this idea in “The Function of the Propagandist,” written for the *International Journal of Ethics* a year later (this also appeared in *Democracy Through Public Opinion* in 1941), Lasswell (1928) proposed that the need in a democratic society for propaganda was structural and that this could be reconciled within a system of ethics. The propagandist was better thought of as a “species of advocate” whose work, if vigorously pursued from all sides, would keep people interested in public affairs and bring social harmony to society in lieu of violence. It was “possible to make out a case for the idea that the long-run interests of society may be served by adjudicators and propagandists at the sacrifice of conformity between private and public convictions on their part” (p. 263). Propaganda was the weapon by which social scientists and ruling elites could also peacefully win stability.

For better or for worse, propaganda was here to stay, and with such conviction Lasswell heralded an intensification of propaganda analysis and the broader enterprise of public opinion research from the social scientific standpoint. Lasswell’s interest in

psychoanalysis and politics landed him a fellowship with the Social Science Research Council (SSRC) in 1928, which marked the beginnings of a long-standing relationship with institutional funding. From 1930 to 1934, Lasswell's service on the SSRC's Committee on Pressure Groups and Propaganda resulted in a bibliographic project that included annotative references to works that spanned the terrain from cultural critiques to experimental and quantitative approaches (Lasswell, Casey, & Smith, 1935). In the introductory essay to the project, Lasswell (1935) summarized his case:

Not bombs nor bread, but words, pictures, songs, parades, and many similar devices are the typical means of making propaganda. Not the purpose but the method distinguishes propaganda from the management of men by violence, boycott, bribery, and similar means of social control. (Lasswell, 1935, p. 3)

He reiterates the symbolic significance of propaganda as part of a "politics of prevention" (Lasswell, 1930). Distinguishing propaganda from a slew of words muddling its scope – education, pedagogy, information, news, publicity, public relations, and advertising – Lasswell (1935) introduced the idea of *process* and clarified the process of propaganda as "the transmission of attitudes that are recognized as *controversial* within a given community" (p. 3). Lasswell's accent on controversy is noteworthy because it reflected his interest in the management of political power by elites in world politics, which continued to separate out his understanding of propaganda *qua* politics from other analyses associated with social influence and behavioralism more broadly construed.¹⁶

The less politically charged language of empiricism characterized the behavioral approach, which would become the dominant paradigm for propaganda analysis and communications research in the United States for the next 50 years. Psychologists and sociologists had already begun to examine propaganda systemically, to classify it and identify its working mechanisms within the context of crowd psychology or the mass society thesis, but for some the dividing line between science and critique was not so clear-cut. For example, in his 1925 book *Means of Social Control*, Frederick Lumley devoted a chapter to propaganda alongside persuasion and advertising, noting its neutral Latin etymology and its modern-day analogous relation to dishonest publicity. Refusing the predominant public classification as "all lies," Lumley suggested that while propaganda might sometimes be truthful, an important feature defining it is its *de facto* flight from the very label "propaganda" (p. 188). In an article for *Sociology and Social Research*, Lumley (1929) more emphatically stated his standpoint: propaganda is "almost wholly bad" because it is "inimical to intellectual development" (p. 324). In *The Propaganda Menace*, Lumley (1933) noted in the preface that he had been remiss in his earlier "superficial" treatment of propaganda and that "Professor Dewey's estimate of the dangers involved in propaganda was not exaggerated" (p. vii). In social scientific fashion, Lumley analyzed propaganda in terms of its content, its method (mechanical, literary, artistic), its affiliations, and its results and limitations, in order to detect it but also, in turn, to condemn it.

The progressive critique did not go ignored, but others such as Leonard Doob and Edward Robinson problematized propaganda's utility in light of the turn to scientific inquiry. In particular, they argued for a clear distinction between the value of scientific study and the "naïve" view of propaganda dominated by critique that identified it as "false, unwholesome, or subversive" (Doob & Robinson, 1935, p. 88). The disinterested or neutral analysis of the social scientist warranted defending, given contemporary pressures to condemn the practice of propaganda. Doob and Robinson agreed with Lasswell: Propaganda was "neither invariably better nor worse than 'rational' discourse" (Doob & Robinson, 1935, p. 89). These were relative ideas. What mattered was the end to which an appeal was put, whether it was intentional or unintentional, and how propaganda actually worked on people's perceptions and attitudes toward specific actions, which depended on the psychological predisposition of the targets, the nature of the suggestion, and the setting within which the propagandist worked. Important for Doob (1935) was to highlight both the unpredictability of success for the propagandist and the possibility and implications for propaganda as an unintentional endeavor, a point which he criticized Lumley for neglecting. In *Propaganda: Its Psychology and Technique* (1935), Doob laid out the mechanisms underlying the "principles of propaganda," which he illustrated with contemporary examples and through communications media such as the press, radio, motion pictures, stage, art, and other printed materials. The idea was to provide readers with an understanding and ability to recognize any and all propaganda, in all its manifestations, whether good or bad. Underlying Doob's project was the hope that people will "puncture the lies in the 'truths' which they accept, and appreciate the truths in the 'lies' which they reject" (p. 412). Only this way, Doob insisted, would people choose leaders wisely and inoculate themselves from fascism.

Propaganda and Media Effects

Consistent with broader trends in the social sciences, the inchoate body of scholarship soon to be identified as communication research lent itself to more pointed questions about the empirical effects of mediated messages in the 1930s and 1940s. The idea of the neutral observer informed by an array of quantitative tools (e.g., sampling, content analysis, survey questionnaires, interviews, measures and rating scales, experimental methods) began to push to the forefront of widely respectable (and more amply funded) inquiry and investigation. Propaganda critique did not entirely evaporate, but the appearance of positivist social science on the scene reshaped attention to Lasswell's definition of propaganda – the manipulation of significant symbols to influence collective attitudes – in the direction of an apolitical interest in the behavioral science of attitude change and media effects. Whereas Lasswell continued to think about propaganda as a political construct, intending to

counter anti-democratic propaganda, other social scientists relegated propaganda to empirical study as uncontroversial mass persuasion.

One area of study still oscillating between critique and media effects, however, concerned the possible impacts of movie-going on early audiences of motion pictures, particularly children and adolescents. The motion picture, like all other facets of communication, had been enlisted to serve the war effort, which called attention to its possible illusion-generating properties, socializing influences, and insidious effects as a mechanism of propaganda (Jacobs, 1939; Johnston, 1939; Peet, 1936). Even before US entrance into the war, the moving picture as a new medium of communication was scrutinized for how its visual grammar might influence emotion, cognition, and the imagination (Lindsay, 1915; Münsterberg, 1916). In addition, the motion picture was vulnerable to attack on a morality front because it was feared that its content could contribute to delinquent, criminal, or immoral behavior of youth. Despite attempts to identify direct effects between the movies and crime in the 1920s, the research yielded inconclusive results, suggesting that wider social experiences of movie-going were important factors in shaping behavior. Yet discourses on the motion picture industry were controversial, and in a sense, they contributed to a shift of attention from the reputed harmful effects of propaganda to the idea that reform-minded counterpropaganda was itself a kind of propaganda.

In the late 1920s, an unprecedented nationwide effort was launched by what would become the Motion Picture Research Council – under the auspices of the Payne Fund – to study the influence of motion pictures on children and adults. Initially, the impetus for the studies was split between reformist impulses emanating from the Rev. William Short, who had secured the funding in order to substantiate his calls for policy reform, and W. W. Charters, head of the Bureau of Educational Research at Ohio State University, who as director of the research team had intended an objective account of the motion picture underwritten by the protocols of social scientific methodology (Jowett, 1999, pp. 217–223). Short's intention was to compile a stockpile of scientifically based evidence detailing the offenses of movies and the movie industry, and then to launch, in his own words, a “program of propaganda and action” (Jowett, 1999, p. 217).

Over a four-year period (1929–1933), the council released an extensive series of self-contained studies, the significant results of which were published in *Motion Pictures and Youth* (Charters, 1933). The Payne research did not expressly query the effects of propaganda *vis-à-vis* motion pictures on audiences. Rather, the studies concentrated more broadly on the effects of motion pictures on emotions, attitudes, beliefs, and conduct, in addition to measuring frequency of attendance and taste preferences. Most notably, the Payne studies indicated that movies exerted quantitatively measurable influences, but “individual differences,” such as age, sex, experience, and cultural background, were critical factors contributing to how children responded to motion pictures, as well as frequency of attendance (Jowett, 1976, pp. 222–223; Jowett, Jarvie, & Fuller, 1996, pp. 83, 91). Moreover, consistent with Lasswell's suppositions on propaganda, the studies suggested that movies tended to reinforce already existing prejudices, attitudes, and

behaviors rather than change them. Of the most controversial of the findings was Blumer's (1933) study on motion pictures and conduct, in part because it drifted from the quantitative methodology that dominated the bulk of the research and because Blumer's findings tended to support the criticisms that had been dogging the industry for a decade, or at least they could be interpreted that way.

Despite the Payne Studies' conscious attempts to present the interpretations as objectively as possible, the studies indicated "an underlying but subtle hostility toward the immense socializing influences of the movies" (Jowett, 1976, p. 225). The publication of Henry James Forman's *Our Movie Made Children* (1933), a popularized version of the study, represented an unabashed indictment of the industry backed by cherry-picked evidence from the Payne research. Forman had been employed to write the book with the express purpose of winning public officials' support for the establishment of a film censorship board. The Payne researchers defended their work in the face of Forman's efforts to link the studies' findings with a propaganda campaign. The internal controversy that ensued worked to obscure the importance of the studies' findings, which Jowett, Jarvie, and Fuller (1996) argue had to do with a methodological paradigm shift that would influence future communications research (pp. 120–121). According to Lowery and DeFleur (1995), the pioneering efforts of Payne Fund studies reinforced "the *legacy of fear* that had been kept alive by strident denunciations of the evils of propaganda" while they also shifted concern from propaganda criticism toward the establishment of "the field of media research within the perspectives of science" (pp. 41–42).

A body of scholars increasingly coalesced around an emerging interdisciplinary field in the 1930s, making use of quantifiable data and funding awarded by foundations and the media industries to research attitude and behavioral change. The "agencies of mass impression," as the 1933 President's Research Committee on Recent Social Trends called them, involved the one-to-many modes of communication that in the 1940s would be referred to as "mass media": newspapers, magazines, motion pictures, and radio broadcasting (Czitrom, 1982, p. 126). In addition to propaganda analysis, research under other names began to define the nascent field of communications such as public opinion research, social psychology, and the emerging field of marketing research. The advertising field in the 1920s had already enlisted the behavioral science of psychology to assist in the influencing of consumer choices. Radio broadcasting's commercialization led the charge of integrating marketing with communication research. Broadcasters and advertisers alike stood to gain from measurements of their programming and advertising effectiveness. More than any other figure, social scientist Paul Lazarsfeld promoted this integration while establishing "the theoretical relevance of communication research based on applied problems" (Delia, 1987, p. 51). Lazarsfeld's establishment of an Austrian research center in 1925 that combined market research (and its funding opportunities) with social scientific inquiry was the template from which he would work institutionally in the United States (Morrison, 2008). In this way, Lazarsfeld's work shaped the direction of communication research for the next decade.

Lazarsfeld believed that marketing research could provide sound strategy and methodology in applied research for both predicting and controlling consumer behavior and, at the same time, the data by which psychologists could mine theory “to illuminate the subtleties of psychological processes, particularly in the area of motivation” (Czitrom, 1982, p. 128). In 1937, Lazarsfeld was appointed director of a new project, the Princeton Office of Radio Research (ORR), the full name of which was *The Essential Value of Radio to All Types of Listeners* (Rogers, 1994, p. 265). According to Buxton (2003), the Rockefeller Foundation initially supported the project because officials hoped it could yield insight into how commercial broadcasting might integrate educational, artistic, and public interest programming into its mandate. Radio, it was thought by the foundation’s humanities division, “could be used as a vehicle for enhancing the cultural levels of the mass public” (Buxton, 2003, p. 301). However, under Lazarsfeld’s direction, the project shifted away from the possible reconciliation between broadcasters and educators and instead moved toward methodological concerns in answering effects-related questions about radio listening.

A central focus of the work became the generation of hypotheses about measurable effects of persuasion, such as attitude changes in getting people to buy something. Despite its shift in focus, Lazarsfeld’s radio research was enormously productive. In collaboration with Hadley Cantril, Herta Herzog, and CBS executive Frank Stanton, the radio project published four books and more than 40 articles (Lazarsfeld, 1940; Lazarsfeld, Cantril, & Stanton, 1939; Lazarsfeld & Stanton, 1941, 1979). The project pushed beyond the laboratory or experimental approach to radio taken by Cantril and Allport (1935) by using survey research, polling data, in-depth interviews, focus groups, and content analysis in examining all sorts of radio programming, such as daytime soap operas and popular music, as well as the panicked reaction to Orson Welles’s broadcast, *Invasion from Mars* (Cantril, Wells, Koch, Gaudet, & Herzog, 1940).¹⁷ In 1939, Lazarsfeld and his project moved to Columbia University where he became a professor of sociology, and his radio research was administered through the newly developed Bureau of Applied Social Research, of which he appointed himself the director. Having made use of market research funding to pursue his larger research agenda,¹⁸ Lazarsfeld’s scholarship would eventually crystallize around behavioral communications research and be linked most notably to a body of empirical work subsequently described as media effects, or “the limited effects model” (see Chapter 29, this volume).

Lasswell also was moving in this direction, but he remained true to his focus on propaganda as a means to exert and maintain political control, which he thought could be best achieved by integrating political propaganda with all other forms of social control. The late 1930s raised new concerns that would provide opportunities for scholars at the forefront of communications research. The question of what to do about propaganda in relation to the public held its ground, but the arrival of “antidemocratic propaganda” (Gary, 1999) onto the scene propelled Lasswell’s expertise to the apex of policy work on communication and national security.

Propaganda, Education, and Policy

Two main strands of thought concerning the public's ability to protect itself against propaganda dominated the 1930s. Progressives and social scientists alike agreed that the public was psychologically vulnerable to the irrational, that it could be fooled at least some of the time, and that some measures were needed to counteract propaganda, or at minimum, to militate against mass persuasion directed at questionable ends. One response was to promote education as a defense against propaganda; the other was to counter propaganda with expert-directed propaganda. The former was the approach taken by the Institute for Propaganda Analysis. The latter included the policy work sponsored by the Rockefeller Foundation. The roots of the tension over how to best protect the public lay in Dewey and Lippmann's respective stances on public and participatory democracy.

Dewey's thinking had stimulated others to consider propaganda more directly in relation to education. But the suggestion that education was the antidote to propaganda was not without its Lippmann-inspired skeptics. As several progressive critics had pointed out, educators seemed too easily swept away with the tide of war propaganda during the CPI campaign. New concerns included the infiltration of propaganda into school curricula during peacetime, and more alarming, the idea that educators and researchers themselves could be persuaded to lend their expertise to pseudo- or quasi-scientific projects sponsored and funded by private interests for commercial gain.¹⁹ At lower levels of education, fears of propaganda's dangers in everyday life resonated, prompting the National Education Association in 1929 to caution educators through an informational campaign against the possibility of propaganda infiltrating the school curriculum. In 1937, the National Council for Social Studies put out a yearbook entitled *Education Against Propaganda* that advocated for teachers to learn about public opinion research in order to aid their students in recognizing propaganda "disguised as information or entertainment" (Ellis, 1937, p. iii). Journalists, educators, and social scientists (including Lasswell and Hadley Cantril) wrote its articles.

One main culprit in the battle for clarity and rationality in knowledge over propaganda was the problem of language. If thinking could be understood scientifically, and if better thinking could be taught as Dewey maintained, then language was not to be neglected in the arsenal of double-sided weapons. The field of general semantics saw itself as the solution to obfuscation in language. People could be taught to think about language scientifically, they could be shown that language was distinct from reality (e.g., as in Hayakawa's [1941] map/territory distinction), and that it could be used to manipulate how one thinks. The way to protect oneself from loaded abstractions and vacant meaning was to deconstruct the machinations of language. In this way, semanticists such as Alfred Korzybski, I. A. Richards, S. I. Hayakawa, and Stuart Chase argued that general semantics could inoculate people from the illogic and abuses inherent in word play on which propagandists depended. This line of

thinking buttressed the call for education as a practical but imperative endeavor, which was taken up by the Institute for Propaganda Analysis (IPA), an initiative for adult education started in 1937 by faculty and anti-propaganda progressives associated with Columbia University Teacher's College. The rationale underpinning the need for the IPA was the contention that propaganda worked because people failed to see it when it was in operation. Word play and logical fallacies were the grist for propaganda's emotional and irrational appeals, so the way to combat it was to teach people to detect its devices.

At the start, the IPA operated like a movement interested in advancing the propaganda critique, even as it called itself a non-partisan organization conducting objective research guided by scientific method. Its mission had two prongs: first, to formulate an anti-propaganda praxis that could provide adults with a model to analyze propaganda, and, second, to expose case studies or examples of propaganda by which an analysis could be walked through with lay readers using the model. The institute was successful on the first count, enough so to attract sufficient attention and funding to keep it going for another four years after the first publication of its volume, *Propaganda Analysis: A Bulletin to Help the Intelligent Citizen Detect and Analyze Propaganda*, in 1937. The second bulletin, "How to Detect Propaganda," introduced to the general public a framework of strategies developed by Columbia University professor Clyde Miller, which he entitled, "Seven Propaganda Devices."²⁰ As Sproule (1997) argues, neat "gimmicks" such as this and the "ABCs of Propaganda Analysis" gained widespread popularity because they satisfied a material need to do something for the public's benefit about the problem of propaganda. Book treatments such as *Group Leader's Guide to Propaganda Analysis* (Edwards, 1938), for example, offered a kind of hands-on practicum for educators to adopt. But the institute soon ran into trouble when the novelty of its atheoretical framework wore out and when it could not sustain the second part of its self-mandate in a timely fashion – to provide actual analyses of propaganda, especially contemporary examples. The institute's reliance on generalities and naïve analysis began to wear thin as its subscribers demanded more substantive research on actual controversies. More to the point for Sproule (1997), the culminating predicament for the IPA involved an untenable balancing act between foreign and domestic anti-propaganda at the crossroads of international crisis.

With nativist anti-Semitic propaganda on the rise in the United States and the likelihood of another world war around the corner, the stakes around the IPA's utility changed. The IPA's objective was to teach the layperson to identify propaganda content across an array of mediated formats, whether print journalism, photojournalism, radio, or motion pictures. The IPA bulletin topics ranged from domestic case studies in politics and industry to foreign war propaganda. Given that the institute tried to situate itself as a neutral enterprise, any and all propaganda was fodder for analysis, whether fascist, communist, corporate, or New Deal.²¹ An effort such as *The Fine Art of Propaganda* (Lee & Lee, 1939), a book-length study of Father Coughlin's incendiary radio rhetoric, provided a much-needed exposé on domestic anti-Semitism

that garnered more support for the IPA in the short term. But the decision to publish *War Propaganda and the United States* (Lavine & Wechsler, 1940) pitted the institute against the pro-intervention movement because it treated all propaganda more or less as worthy of dissection and condemnation. US opinion leaders began to grumble that anti-propaganda was anti-democratic, and the institute's work came under increased scrutiny. Sproule (1997) explains the IPA's eventual demise in late 1940 as chiefly a conflict in theory versus praxis.

Paradoxically, the IPA found that it could not preserve its scientific reputation by maintaining a relative neutrality of treatment when the opposed propagandas happened to be those of Britain versus Germany. In this case, equal treatment of propaganda rendered the IPA vulnerable to criticism that its approach was fundamentally defective for being unable to distinguish the relative moral qualities of democratic and fascist propaganda. Here, evenhanded criticism worked to eviscerate the institute's reputation as a contributor to progressive praxis. (Sproule, 1997, p. 156)

The IPA was never able to win the support of grantors interested in underwriting the kind of scientific research that could be wedded with policy concerns such as the work conducted by Lazarsfeld and Lasswell. The growing fascist movement in the United States, in combination with a consensus among political opinion leaders that Nazi propaganda was formidably extensive and demanded immediate response, brought new opportunities for communications research, particularly with respect to Lasswell's expertise. Lasswell's proposition that propaganda was a necessary instrument of modern warfare set up an argument for what should be the policy response to the Nazi menace. The question of whether democracy could endure anti-democratic propaganda had been raised by political scientist George E. Gordon Catlin in 1936. Catlin argued that the problem for a democratic government was not propaganda *per se* but rather a monopoly over expression. A democracy needed to use propaganda to promote its interests, but it must also permit the existence of competing propagandas. "This dilemma of tolerating but not being vulnerable to anti-democratic ideas," Gary (1999) notes, "was *the* problem of propaganda for late 1930s liberals" (pp. 75–76). In effect, propaganda had to be met with better, more successful propaganda. Against this backdrop, Lasswell would be a central figure in a normative approach to communication policy and national security.

In 1939, John Marshall organized a "communications group" to begin a series of seminars with the intention of forwarding Lazarsfeld's research but "along more systematic lines" (Buxton, 2003, p. 308). The group was to undertake the study of "mass communication."²² Having funded projects concerning educational uses of media, including Cantril's and Lazarsfeld's radio research, under Marshall's lead the Rockefeller Foundation recognized the utility in working with educators, broadcasters, related non-profits, and government agencies to forward the agenda of its humanities division. Marshall intended that the Communication Group bring theoretical and empirical coherency to bear on the rather disparate and insufficient state

of communication research. From this seminar transpired the general framework that would become the dominant paradigm for several decades of communication research – who said what to whom with what effect?²³ The four-question scheme provided researchers with a model for analysis that could coordinate specific questions with appropriate research strategies, and that would underscore the empirical validity of effects. Although the framework was enormously valuable for its heuristic property, as Czitrom (1982) and other communication historians have noted, the omission of the “why” question in combination with the framework’s reliance on behavioral science and empiricism effectively narrowed the scope of communication research and its explanation to “a process of persuasion” (p. 132). The broader questions of media power and long-standing rhetorical critique were pushed out of the picture at the same time that the view of propaganda as a neutral mechanism of mass influence began to crystallize under the group’s influence.

Hitler’s invasion of Poland and the threat of war, particularly the critical lack of preparation by the United States in relation to the problem of managing public opinion in the event of war, preoccupied the group at its onset. This at once produced consensus over the importance of a line of inquiry concerning propaganda analysis, but it also affirmed the group’s incongruence over the instrumental use of counter-propaganda in service to national security and over what should be their role as intellectuals in preserving the democracy on the eve of crisis. Nevertheless, under Lasswell’s guidance and Marshall’s support, the group nearly immediately aligned its research program with the security needs of the state through the creation of what Gary (1999) calls a “propaganda prophylaxis” that would involve “both offensive and defensive propaganda intelligence work” (pp. 89–91).

The piercingly anti-democratic implications of the prophylaxis was not lost on the group but was for the most part overridden by several factors. The idea of propaganda in association with the state and warfare recalled bad memories in the public imaginary, as it did for some of the group members themselves, and its negative connotations undoubtedly fueled the isolationist platform in Congress that inhibited Roosevelt. Because the government was not yet supporting the communications research deemed by the group as necessary to national security, the foundation provided sanction for the group to robustly hash out any controversial questions framing its inquiry. The July 1940 seminar report, “Research in Mass Communications,” was in Gary’s (1999) words “a crucial document in the intellectual history of communications research, in part because it was an ideological manifesto, intended to move scholars into the trenches of propaganda warfare” (p. 102) by justification of the imperative to control public opinion to save democracy.

A series of related and supporting assumptions about social scientists and what they could do were implicit: they could help leaders understand the public mind and its prejudices; they could help change troublesome prejudices; they could assuage the public’s fears in the crisis; they could effectively mediate between the public and its leaders; and finally, because democracy depends on the consent of the governed, social

scientists could contribute to more effective democratic processes because they could help leaders obtain consent more easily. (Gary, 1999, p. 103)²⁴

Ironically, skepticism among social scientists over propaganda's omnipotence – which explained the group's insistence that effects be empiricized – also coincided with genuine fears over the government's unpreparedness in the increasingly pervasive face of effective Nazi propaganda. Thus, as Gary (1999) shows, by the time the US Justice Department signaled its formation of a "propaganda defense unit" in spring 1940, the foundation's humanities division "had already erected an extensive, coordinated network of propaganda research projects, and listening posts to monitor, document, and analyze the international traffic in propaganda, especially the Fascist variety" (p. 109). To be sure, Lasswell's expertise proved expedient to the government's wartime needs, as it would also solidify his stature as a "founding father" (Schramm, 1954) of the field of communication research.

Conclusion

By the eve of World War II, the idea of propaganda could not be relegated to the enemy alone. At the start of the Great War, progressive thinkers could make the case that the benign publicity apparatus they had in mind would achieve peace in democratic stride. But the atmosphere of intolerance generated from abuses of propagandists during the CPI's tenure at home and abroad overwhelmed attempts to bifurcate propaganda by national associations. During the interwar years, the idea of propaganda and the public's capacity to critically engage it underwent new-found scrutiny. If propaganda and publicity had been equivocal notions before the war, the postwar environment sharpened distinctions. At best, propaganda promoted the economic growth and stability of commercial enterprise as it managed public opinion accordingly. At worst, propaganda was the hangman's noose strangling the free flow of information vital to a functioning democracy. Despite the efforts of public relations practitioners to neutralize propaganda's vigor, the progressive critique held ground, visible through adult education initiatives and the civic-minded work of the IPA, until giving way to the administrative research agenda dominated by Lazarsfeld and his colleagues. As Wahl-Jorgensen explains in Chapter 26 of this volume, although the normative project of the Chicago School was well suited to address the wider socio-cultural questions concerning cohesion, conflict, and control, "their tools were much less use in tapping into emerging agendas of propaganda and psychological warfare." In the late 1930s when another war loomed, intellectuals, acutely aware of propaganda's viral-like propensity, worried over how to direct its potency toward democratic ends while also shielding the public from the possibility of contamination from foreign propaganda. For those scholars at the forefront of communication research

as it intersected with national security policy, the solution could only be “democratic propaganda” as they, the experts, would engineer it.

NOTES

- 1 I am indebted to Barry Marks (1957), whose unpublished dissertation is central to this chapter's argument.
- 2 Brownlow (1978) claims that the secrecy of the British campaign stems from the fact that they found the need for propaganda “somewhat embarrassing” (p. 6.).
- 3 Vaughn (1980) suggests that Lippmann had a hand in setting up what became the Committee on Public Information (CPI), although former muckraking journalist George Creel was appointed to head it. Lippmann, who criticized Creel during the war's tenure, served in Europe as a military officer in an intelligence unit whose function was to disseminate propaganda across enemy lines. Vaughn (1980, p. 336, n. 9) notes that although the unit was separate from the CPI, its efforts were often coordinated with the committee's. See also Weingast (1949) and Cary (1967).
- 4 According to Mock and Larson (1939), the CPI was initially established for the purpose of managing the problem of censorship with the dissemination of war news.
- 5 At the same time, many pacifist progressives and the American Socialist Party were deeply cynical of the motives for US participation in the war. Increasingly, a rift grew on the left between those who deemed the war opportunism for US imperialism and expansion of capitalist domination and those who imagined that the war might provide an opportunity to pursue progressive policies.
- 6 Also see *The Creel Report: Complete Report of the Chairman of the Committee on Public Information* (United States Committee on Public Information, 1972) for a detailed account of the strategies used to reach the nation and international community.
- 7 The origins of these distinctions is not decisively known, but all three terms were in use in the 1940s, especially black propaganda, which was associated with the Nazis, although all belligerent governments employ black propaganda. The distinction among them refers primarily to sourcing: white is known, gray is unknown or ambiguous, and black is hidden, distorted, or misattributed. See Cull, Culbert, and Welch (2003).
- 8 For a more complex account of the context in which academics worked, see Gruber (1975). In the context of public intellectuals, see Dewey (1917) and Bourne (1917).
- 9 Two of the essays, “What Modern Liberty Means” and “Liberty and the News,” were originally published in the *Atlantic Monthly* in 1919.
- 10 Revisiting dominant interpretations of Lippmann, Jansen (2008) argues that the causal linking of Lippmann's “non-positivist understanding of the nature and limits of scientific inquiry” to the effects traditions of mass communication is an “epistemological incongruity,” or misreading of Lippmann's corpus of work (p. 83).
- 11 Jansen strongly disputes this reading of Lippmann, arguing that Carey neglects to give recognition to the full weight of Lippmann's philosophical position, which would complicate Lippmann's understanding of how to activate democracy in a large-scale complex society. Jansen charges Carey with the most responsibility in framing the debate between Lippmann and Dewey as dichotomous, which has had the effect of subsequent scholarship largely overlooking their philosophical commonality.

- 12 In kindred spirit to defend publicity work, public relations man Ivy Lee (1925) insisted that propaganda, as opposed to publicity, was bad only insofar as it failed to disclose the source behind it. As far as Lee was concerned, this was the chief distinction between propaganda and publicity, the latter being desirable as a strategy of "getting out the facts" because it could be held accountable.
- 13 A short time later, Lee (1934) addressed the uses of propaganda in an international context, forwarding the idea, in quick step with Bernays, that "legitimate international propaganda" could be used to win and keep the peace.
- 14 Notably, Bernays was among the first to attend to the idea of the group leader along the lines of opinion leadership, a concept that was examined academically some 20 years later. Bernays (1923) had touched on the subject in *Crystallizing Public Opinion*, suggesting that the leader held sway according to the judgment of the herd but that such potential power need not be associated with the leader's initial qualifications for leadership (p. 159). In *Propaganda*, Bernays (2005) expands on the idea, attributing his inspiration for its use as a PR technique to the CPI's successful enlistment of "key men" whose "mere words carried authority to hundreds or thousands or hundreds of thousands of followers" (p. 54).
- 15 Sproule (1997) situates the hypodermic needle model's history within the problematic of a paradigm shift in which the spokespeople for the new paradigm "misremember the preceding research tradition and its contributions" (p. 234). The emerging communication scientists erroneously charged the progressive critics of propaganda with assuming media effects rather than recognizing that their critique emphasized the relationship of propaganda to the larger sociocultural environment, which could resist propaganda and invite participatory democracy given the appropriate tools for exposing propaganda to the public. Lasswell's introduction to later editions of *Propaganda Technique*, written in 1970, more clearly couches his analysis in a wider sociocultural frame.
- 16 In the updated volume of *Propaganda and Promotional Activities*, entitled *Propaganda, Communication, and Public Opinion* (Smith, Lasswell, & Casey, 1946), the authors suggested that "the usefulness of the present volume will be greatest if special attention is directed toward the structure of the emerging science of communication" (p. 3), which reflected the fragmentation of propaganda analysis from wider processes that included the progressive critique. Sproule (1997) argues that the original project conceptualized as a heterogeneous amalgam of cultural critique, disinterested experimentation, and case studies only "proved tenable" because the imminent split between the humanities and social sciences was still "relatively unobtrusive in 1931 when the project was initiated" (p. 51). In 1937, *Public Opinion Quarterly* was founded in the spirit of continuing the annotative bibliographic project.
- 17 The significance of the radio research would have an important impact on securing the funding for Robert King Merton and his team's study of singer Kate Smith's radio bond drive during World War II (Merton, Lowenthal, & Curtis, 1946).
- 18 Referring to David Morrison's early work on Lazarsfeld, Rogers (1994) writes that Lazarsfeld's interest was not mass communication per se but rather methodology. Rogers argues Lazarsfeld was a "diffident pioneer in studying the effects of mass communication. He saw himself as a methodologist, and communication was just a convenient bathtub in which to float his research boats" (p. 270).
- 19 In 1927, for example, it was discovered that the National Electric Light Association had sponsored academic research on electric power and commissioned educators to write textbooks in support of industry privatization (Gruening, 1931).

- 20 The seven propaganda devices identified were name-calling, glittering generalities, transfer, testimonial, plain folks, card stacking, and bandwagon.
- 21 Because the institute had devoted much attention to fascist and pro-business propaganda, however, it opened itself up to the criticism that it was left wing, pro-New Deal, pro-communist, or anti-business, which it tried to address directly (Institute for Propaganda Analysis, 1939, p. 106).
- 22 According to Rogers (1994, p. 222, footnote), Marshall's correspondence suggests he may have been the first to use the term *mass communication* in 1939.
- 23 Gary (1999, p. 88) contends that the original four-question scheme, widely attributed only to Lasswell, was actually the result of months of exchanges among the members of the seminar. The group's 1940 paper, "Research in Mass Communication," identified the first question as who said what "with what intention" (p. 100). When Lasswell published the scheme, it became: "Who says what in which channel to whom with what effect?" (Lasswell 1948). Buxton (2003) claims that the initial formulation of the "charting" of the questions belongs to Marshall.
- 24 One important outcome of the Communications Group driven by the historical moment was University of Chicago professor Douglas Waples's proposal to create a permanent institute for communications research that would train individuals to work as administrators and propagandists. What resulted was a two-year degree-bearing master's program to study communications, public opinion, and mass persuasion more broadly construed (see Chapter 26, this volume).

Frankfurt School, Media, and the Culture Industry

Douglas Kellner

ABSTRACT

The Frankfurt School theorists were among the first theorists to examine the fundamental roles of the media in shaping thought and behavior, influencing politics, and managing consumer demand in the twentieth century. Horkheimer and Adorno's analysis of the "culture industry" presented a model of media as instruments of power and social control developed by Walter Benjamin, Herbert Marcuse, Erich Fromm, and Jürgen Habermas, who gave the Horkheimer and Adorno culture industry analysis a historical grounding. The Frankfurt School also studied the effects of mass culture and the rise of the consumer society on the working classes that were to be the instrument of revolution in the classical Marxian scenario. They also analyzed how the culture industries and consumer society were stabilizing contemporary capitalism and thus were among the first to see the expanding roles of mass media and communication in politics, socialization and social life, culture and the constructions of subjectivities. In this chapter, I examine the contributions to media and social theory developed by the Frankfurt School and their limitations and blind spots.

The term “Frankfurt School” refers to the work of members of the Institut für Sozialforschung (Institute for Social Research), which was established in Frankfurt, Germany, in 1923 as the first Marxist-oriented research center affiliated with a major German university. Under its director, Carl Grünberg, the institute’s work in the 1920s tended to be empirical, historical, and oriented toward problems of the European working-class movement. Max Horkheimer became director of the institute in 1930 and gathered around him many talented theorists, including Erich Fromm, Franz Neumann, Herbert Marcuse, and T. W. Adorno. Under Horkheimer, the institute sought to develop an interdisciplinary social theory that could serve as an instrument of social transformation. The work of this era was a synthesis of philosophy and social theory, combining sociology, psychology, cultural studies, and political economy. (On the Frankfurt School, see the readers edited by Arato & Gebhardt, 1982; Bronner & Kellner, 1989. On critical studies, see Jay, 1973; Kellner, 1989; Wiggershaus, 1994.)

The first major institute project in the Horkheimer period was a systematic study of authority, an investigation into individuals who submitted to irrational authority in authoritarian regimes. This culminated in a two-volume work, *Studien über Autorität und Familie* (1936), and a series of studies of fascism. (For the Frankfurt School on fascism, see Neumann, 1966; Kellner, 1989; Marcuse, 1998.) Most members of the Frankfurt School were both Jews and Marxist radicals and were forced to flee Germany after Hitler’s ascendancy to power. The majority emigrated to the United States, and the institute became affiliated with Columbia University from 1931 until 1949, when it returned to Frankfurt. Since 1936, the institute has referred to its work as the “critical theory of society.” For many years, “critical theory” stood as a code for the institute’s Marxism and was distinguished by its attempt to found a radical interdisciplinary social theory rooted in Hegelian–Marxian dialectics, historical materialism, and the critique of political economy and theory of revolution. Members argued that Marx’s concepts of the commodity, money, value, exchange, and fetishism characterize not only the capitalist economy but also social relations under capitalism, where human relations and all forms of life are governed by commodity and exchange relations and values.

In a key article, “Traditional and Critical Theory,” Horkheimer (1937) argued that “traditional theory,” which included modern philosophy and science since Descartes, tended to be overly abstract, objectivistic, and cut off from social practice. “Critical theory,” by contrast, was grounded in social theory and (Marxian) political economy, carried out a systematic critique of existing society, and allied with efforts to produce alternatives to capitalism and bourgeois society (then in its fascist stage in much of Europe). Horkheimer (1972) wrote that critical theory’s “content consists of changing the concepts that thoroughly dominate the economy into their opposites: fair exchange into a deepening of social injustice; a free economy into monopolistic domination; productive labor into the strengthening of relations that inhibit production; the maintenance of society’s life into the impoverishment of the people” (p. 247). The goal of critical theory is to transform these social conditions and provide

a theory of “the historical movement of the period which is now approaching its end” (p. 247).

Critical theory produced theoretical analysis of the transformation of competitive capitalism into monopoly capitalism and fascism and hoped to be part of a historical process through which capitalism would be replaced by socialism. Horkheimer (1972) claimed that “the categories which have arisen under its influence criticize the present. The Marxist categories of class, exploitation, surplus value, profit, impoverishment, and collapse are moments of a conceptual whole whose meaning is to be sought, not in the reproduction of the present society, but in its transformation to a correct society” (p. 218). Critical theory is thus motivated by an interest in emancipation and is a philosophy of social practice engaged in “the struggle for the future.” Critical theory must remain loyal to the “idea of a future society as the community of free human beings, insofar as such a society is possible, given the present technical means” (p. 230).

In a series of studies carried out in the 1930s, the Institute for Social Research developed theories of monopoly capitalism, the new industrial state; the role of technology and giant corporations in monopoly capitalism; the key roles of mass culture and communication in reproducing contemporary societies; and the decline of democracy and the individual. Critical theory drew alike on Hegelian dialectics, Marxian theory, Nietzsche, Freud, Max Weber, and other trends of contemporary thought. It articulated theories that were to occupy the center of social theory for the next several decades. Rarely, if ever, has such a talented group of interdisciplinary intellectuals come together under the auspices of one institute. They managed to keep alive radical social theory during a difficult historical era and provided aspects of a neo-Marxian theory of the changed social reality and new historical situation in the transition from competitive capitalism to monopoly capitalism.

The Culture Industry and Debates over Mass Culture

The Frankfurt School coined the term “culture industry” in the 1930s to signify the process of the industrialization of mass-produced culture and the commercial imperatives that constructed it (Horkheimer & Adorno, 1972). The critical theorists analyzed all mass-mediated cultural artifacts within the context of industrial production, where the commodities of the culture industries exhibited the same features as other products of mass production: commodification, standardization, and massification. The culture industries had the specific function, however, of providing ideological legitimation of the existing capitalist societies and of integrating individuals into its way of life.

For the Frankfurt School, mass culture and communications therefore stand at the center of leisure activity, are important agents of socialization, are mediators of political reality, and should thus be seen as major institutions of contemporary societies

with a variety of economic, political, cultural, and social effects. Furthermore, the critical theorists investigated the cultural industries politically as a form of the integration of the working class into capitalist societies. The Frankfurt School theorists were among the first neo-Marxian groups to examine the effects of mass culture and the rise of the consumer society on the working classes that were to be the instrument of revolution in the classical Marxian scenario. They also analyzed how the culture industries and consumer society were stabilizing contemporary capitalism and accordingly sought new strategies for political change, agencies of political transformation, and models for political emancipation that could serve as norms of social critique and goals for political struggle.

The positions of Adorno, Leo Lowenthal, and other members of the inner circle of the Institute for Social Research were contested by Walter Benjamin, an idiosyncratic theorist loosely affiliated with the institute. Benjamin, writing in Paris during the 1930s, discerned progressive aspects in new technologies of cultural production such as photography, film, and radio. In "The Work of Art in the Age of Mechanical Reproduction," Benjamin (1969) noted how new mass media were supplanting older forms of culture. In this context, the mass reproduction of photography, film, recordings, and publications replaced the emphasis on the originality and "aura" of the work of art in an earlier era. Freed from the mystification of high culture, Benjamin believed that mass culture could cultivate more critical individuals able to judge and analyze their culture, just as sports fans could dissect and evaluate athletic activities. In addition, Benjamin asserted that processing the rush of images of cinema helped to create subjectivities better able to parry the flux and turbulence of experience in industrialized, urbanized societies.

Benjamin worked with the prolific German artist Bertolt Brecht on films, created radio plays, and attempted to use the media as organs of social progress. In the 1934 essay "The Artist as Producer," Benjamin (1999) argued that radical cultural creators should "refunction" the apparatus of cultural production, turning theater and film, for instance, into a forum of political enlightenment and discussion rather than a medium of "culinary" audience pleasure. Both Brecht and Benjamin wrote radio plays and were interested in film as an instrument of progressive social change. In an essay on radio theory, Brecht anticipated the Internet in his call for reconstructing the apparatus of broadcasting from one-way transmission to a more interactive form of two-way, or multiple, communication (Silberman, 2000) – a form first realized in citizens band radio and then the Internet and new media.

Moreover, Benjamin wished to promote a radical cultural and media politics concerned with the creation of alternative oppositional cultures. Yet he recognized that media such as film could have conservative effects. While he thought it was progressive that mass produced works were losing their "aura," their magical force, and were opening cultural artifacts for more critical and political discussion, Benjamin recognized that film could create a new kind of ideological magic through the cult of celebrity and techniques such as the close-up that fetishized certain stars or images via cinematic technology. Benjamin was thus one of the first radical cultural critics

to look carefully at the form and technology of media culture in appraising its complex nature and effects. Benjamin also developed a unique approach to cultural history that is one of his most enduring legacies. In a micrological history of Paris in the eighteenth century, Benjamin used careful study of particulars and singular events to elucidate the more general contours of the epoch. This uncompleted project contains a wealth of material for study and reflection (see Benjamin, 2000, and the studies in Buck-Morss, 1977, 1989) and illustrates his obsession with both intensely focusing on particulars and creating constellations of categories that provide more comprehensive theoretical and historical vision and understanding.

Horkheimer and Adorno (1972) answered Benjamin's optimism concerning the mass media in a highly influential analysis of the culture industry published in their book *Dialectic of Enlightenment*, which first appeared in 1948 and was translated into English in 1972. They argued that the system of cultural production dominated by film, radio broadcasting, newspapers, and magazines was controlled by advertising and commercial imperatives and served to create subservience to the system of consumer capitalism. While later critics pronounced their approach too manipulative, reductive, and elitist, it provides an important corrective to more populist approaches to media culture that downplay how media industries exert power over audiences and help produce thought and behavior that conforms to the existing society (see Kellner, 1989, 1995).

The analyses by members of the institute of the functions of culture, ideology, and the mass media in contemporary societies constitute one of its most valuable legacies. The critical theorists excelled as critics of both so-called "high culture" and "mass culture" while producing many important texts in these areas. Their work is distinguished by the close connection between social theory and cultural critique and by their ability to contextualize culture within social environments and struggles. In particular, their theory of culture was bound up with analysis of the dialectic of enlightenment. Culture – once a refuge of beauty and truth – was falling prey, they believed, to tendencies toward rationalization, standardization, and conformity that they saw as a consequence of the triumph of the instrumental rationality that was coming to pervade and structure ever more aspects of life. Thus, while culture once cultivated individuality, it was now promoting conformity and was a crucial part of "the totally administered society" that was producing "the end of the individual" (Horkheimer & Adorno, 1972).

Their analysis of the fate of culture in modernity was part and parcel of the Frankfurt School's pessimism concerning the rise of the totally administered society in its fascist, democratic state capitalist, and state communist forms. Yet the group continued to privilege culture as an important, and often overlooked, source of social knowledge, as well as a potential form of social criticism and opposition. As Adorno (1967) once wrote:

[T]he task of [cultural] criticism must be not so much to search for the particular interest-groups to which cultural phenomena are to be assigned, but rather to decipher

the general social tendencies which are expressed in these phenomena and through which the most powerful interests realize themselves. Cultural criticism must become social physiognomy. The more the whole divests itself of all spontaneous elements, is socially mediated and filtered, is “consciousness,” the more it becomes “culture.” (Adorno, 1967, p. 30)

This passage points both to the Frankfurt School’s position that administered culture was coming to play ever more fundamental roles in social production and reproduction and to the position that analysis of culture can provide crucial insights into social processes. Critical theory thus assigned a central role to cultural criticism and ideology critique precisely because of the key functions of culture and ideology within contemporary capitalist societies. This focus, which corresponded to some of the institute members’ deepest interests, took the form of a systematic inquiry into the different types, forms, and effects of culture and ideology in contemporary capitalist societies. These ranged from theoretical reflections on the dialectics of culture, which are the ways in which culture could be both a force of social conformity and opposition, to critiques of mass culture and aesthetic reflections on the emancipatory potential of high art.

Adorno (1978) began the institute critique of mass culture in his 1932 article “On the Social Situation of Music” and continued it in a series of studies of popular music and other forms of mass culture over the next decades (see Buck-Morss, 1977). Adorno (1978, 1982) initially criticized popular music production for its commodification, rationalization, fetishism, and reification of musical materials – thus applying the key neo-Marxist social categories to culture – as well as the “regression” in hearing produced by popular music. The framework for his critique was thus the institute theory of the spread of rationalization and reification into every aspect of social life and the resultant decline of the individual.

Hence, while the origins of the institute’s approach to mass culture and communication are visible in Adorno’s early writings on music, the Frankfurt group did not really develop the theory of the culture industry until their emigration to the United States in the 1930s. During their exile period from the mid-1930s through the 1940s, members of the group witnessed the proliferation of mass communications and culture and the rise of the consumer society, experiencing first-hand the advent to cultural power of the commercial broadcasting systems, President Roosevelt’s remarkable use of radio for political persuasion, and the ever-growing popularity of cinema when 85 million to 110 million US citizens paid to see “the movies” each week. Further, they experienced the widespread popularity of magazines, comic books, cheap fiction, and the other flora and fauna of the new mass produced culture.

From their vantage point in California during the 1940s – where many of their exiled compatriots from Germany worked in the film industry – Adorno and Horkheimer were able to experience how business interests dominated mass culture and could observe the fascination the entertainment industries exerted within the emerging media and consumer society. Marcuse, Lowenthal, and others, who worked

in Washington during this period for the Office of War Information and the US intelligence services, were able to observe government use of mass communications as instruments of political propaganda (Marcuse, 1998). The critical theorists thus came to see what they called the “culture industry” as a central part of a new configuration of capitalist modernity that used culture, advertising, mass communications, and new forms of social control to induce consent to and reproduce the new forms of capitalist society. The production and transmission of media spectacles that transmit ideology and consumerism through the means of allegedly “popular entertainment” and information were, they believed, a central mechanism through which contemporary society came to dominate the individual.

Adorno and Horkheimer adopted the term “culture industry,” as opposed to concepts such as “popular culture” or “mass culture,” because they wanted to resist notions that products of the culture industry emanated from the masses (that is, from the people). They saw the culture industry as being an administered culture, imposed from above, as instruments of indoctrination and social control. The term culture industry thus contains a dialectical irony typical of the style of Frankfurt School critical theory: culture, as traditionally valorized, is supposed to be opposed to industry and expressive of individual creativity while providing a repository of humanizing values. In the culture industry, however, culture has come to function as a mode of ideological domination and social control rather than of humanization or emancipation.

The culture industry was perceived as the culmination of a historical process in which technology and scientific organization and administration came to dominate thought and experience. Although Horkheimer and Adorno (1972) carry out a radical questioning of Marxism and the development of an alternative philosophy of history and theory of society in *Dialectic of Enlightenment*, their theory of the culture industry provides a neo-Marxian account of mass media and culture that helps explain both how the culture industry reproduces capitalist societies and why socialist revolutions fail to take place in these societies. In this sense, the institute theory of “culture industry as mass deception” provides a rebuttal both to Lukács’s theory of revolution and “class consciousness,” and to Brecht’s and Benjamin’s belief (Silberman, 2000) that the new forces of mass communication – especially radio and film – could serve as instruments of technological progress and social enlightenment that could be turned against the capitalist relations of production and could be used as instruments of political mobilization and struggle (Kellner, 1989).

For Horkheimer and Adorno, by contrast, these new technologies were used as instruments of ideological mystification and class domination. Against Lukács (1972) and others who argued that capitalist society necessarily radicalized the working class and produced class consciousness, Horkheimer and Adorno argued that the culture industry inhibits the development of class consciousness by providing the ruling political and economic forces with a powerful instrument of social control. The conception of the culture industry therefore provides a model of a technically

advanced capitalist society that mobilizes support for its institutions, practices, and values *from below*, making class consciousness more difficult to attain than before. Using Gramsci's (1971) terminology, the culture industry reproduces capitalist hegemony over the working class by engineering *consent* to the existing society and thus establishing a socio-psychological basis for social integration. Whereas fascism destroyed civil society (or the "public sphere") through politicizing mediated institutions, or using force to suppress all dissent, the culture industry coaxes individuals into the privacy of their own home or the movie theater, producing consumers-spectators of media events and escapist entertainment who are being subtly indoctrinated into dominant ideologies.

For the Frankfurt School, mass culture and communications therefore stand in the center of leisure activity, are important agents of socialization and mediators of political reality, and should thus be seen as major institutions of contemporary societies with a variety of economic, political, cultural, and social effects. Furthermore, the critical theorists investigated the cultural industry politically as a form of integration of the working class into capitalist societies. The Frankfurt School theorists were among the first neo-Marxian groups to examine the effects of mass culture and the rise of the consumer society on the working classes, which were to be the instrument of revolution in the classical Marxian scenario. They also analyzed the ways that the culture industry and consumer society were stabilizing contemporary capitalism and accordingly sought new strategies for political change, agencies of political transformation, and models for political emancipation that could serve as norms of social critique and goals for political struggle. The analysis of the culture industry stands, therefore, in a quite ambivalent relationship to classical Marxism. On one hand, the theory is part of the foundation for the critical theory of society, replacing the critique of political economy that had been the foundation for social theories in the Marxian tradition. It also served as an important part of the explanation of why the institute's critical theorists no longer placed faith in the revolutionary vocation of the proletariat. Yet in other ways, the analysis of the culture industry employs Marxian arguments through stressing capitalist control of culture, the commodification and reification of culture, its ideological functions, and the ways that it integrates individuals into capitalist society.

Horkheimer and Adorno (1972) use a model that pits the individual against its "adversary – the absolute power of capitalism" (p. 120) and describe the tendencies toward conformity, standardization, and deception in the culture industry by means of its control by monopoly corporations that themselves are central to the capitalist system. The very processes of production in the culture industry are modeled on factory production where everything is standardized, streamlined, coordinated, and planned down to the last detail. Indeed, Horkheimer and Adorno use their analysis of the culture industry to call attention to what they perceive as the fundamental traits of the administered society and to carry out a radical critique of capitalism. They suggest that reflection on the culture industries illuminates the processes

toward standardization, homogenization, and conformity that characterize social life under what they call “totalitarian capitalism.” The tendencies toward manipulation and domination in the culture industry illuminate similar trends throughout capitalist society.

The “mass deception” present in the culture industries is similar to the deception, false promises, and manipulation in the capitalist economic, political, and social spheres. In this conception, one of the main trends of contemporary capitalist societies is the synthesis of advertising, culture, information, politics, and manipulation that characterizes the culture industries. This dialectical focus on the relationships between the culture industry and capitalism points to a basic methodological position within the institute’s critical theory of society that in turn marks its affinity to Marxian dialectics. For critical theory, every social phenomenon must be interpreted in terms of a theory of society that itself is part of a theory of capitalism. The theory of the relationships between society and the economy illuminates phenomena such as the culture industry, and its analysis in turn sheds light on the economy and society. Consequently, critical theory operates with a dialectic between its topics of analysis (the culture industry, anti-Semitism, or other themes) and its theory of society. In this dialectic, the theory of society illuminates the topic under investigation, which in turn illuminates the fundamental social trends (i.e., commodification, reification, etc.) described in the social theory.

In the *Dialectic of Enlightenment*, Horkheimer and Adorno (1972) describe the style of culture industry products and the formulas, conventions, and stereotypes that constitute it, as well as several of the strategies used to indoctrinate its consumers into acceptance of the existing society. “Entertainment,” they claim, accustoms the audiences to accept existing society as natural by endlessly repeating and reproducing similar views of the world that present the existing way of life as the way of the world. The eternal recurrence of the same in the culture industry changes, they suggest, the very nature of ideology:

Accordingly, ideology has been made vague and noncommittal, and thus neither clearer nor weaker. Its very vagueness, its almost scientific aversion from committing itself to anything which cannot be verified, acts as an instrument of domination. It becomes a vigorous and prearranged promulgation of the status quo. The culture industry tends to make itself the embodiment of authoritative pronouncements, and thus the irrefutable prophet of the prevailing order. It skillfully steers a winding course between the cliffs of demonstrable misinformation and manifest truth, faithfully reproducing the phenomenon whose opaqueness blocks any insight and installs the ubiquitous and intact phenomenon as ideal. Ideology is split into the photograph of stubborn life and the naked lie about its meaning – which is not expressed but suggested and yet drummed in. To demonstrate its divine nature, reality is always repeated in a purely cynical way. Such a photological proof is of course not stringent, but it is overpowering [. . .] The new ideology has as its objects the world as such. It makes use of the worship of facts by no more than elevating a disagreeable existence into the world of facts in representing it meticulously. (Horkheimer & Adorno, 1972, pp. 147–148)

The culture industry thus tries to induce the individual to identify with society's typical figures and models:

Pseudo individuality is rife: from the standardized jazz improvisation to the exceptional film star whose hair curls over her eye to demonstrate her originality. What is individual is no more than the generality's power to stamp the accidental detail so firmly that it is accepted as such. The defiant reserve or elegant appearance of the individual on show is mass-produced like Yale locks, whose only difference can be measured in fractions of millimeters. (Horkheimer & Adorno, 1972, p. 154)

The culture industry thus serves as a powerful instrument of social control that induces individuals to accept their fate and conform to existing society. Advertising progressively fuses in style and technique with the entertainment of the culture industry (pp. 156–167), which in turn can be read as advertisements for the existing society and established way of life.

From World War II to the Postwar Epoch

During World War II, the institute split up because of pressures of the war. Horkheimer and Adorno moved to California, while Lowenthal, Marcuse, Neumann, and others worked for the US government as their contribution in the fight against fascism. Horkheimer and Adorno (1972) worked on the *Dialectic of Enlightenment*, which sketched out a vision of history from the Greeks to the present that discussed how reason and enlightenment became their opposite, transforming what promised to be instruments of truth and liberation into tools of domination. Under the pressure of societal systems of domination, reason became instrumental, reducing human beings to things and objects and nature to numbers. While such modes of abstraction enabled science and technology to develop apace, it also produced societal reification and domination, culminating in the concentration camps that generated an instrumentalization of death. In the *Dialectic of Enlightenment*, reason thus turned instrumental, where science and technology had created horrific tools of destruction and death, culture was commodified into products of a mass produced culture industry, and democracy terminated in fascism in which masses chose despotic and demagogic rulers. Moreover, in their extremely pessimistic vision, individuals were oppressing their own bodies and renouncing their own desires as they assimilated and allowed themselves to be instruments of labor and war. Sharply criticizing enlightenment scientism and rationalism, as well as systems of social domination, Horkheimer and Adorno implicitly implicated Marxism within the “dialectic of enlightenment” because it too affirmed the primacy of labor, instrumentalized reason in its scientism and celebration of “socialist production,” and shared in Western modernity and the domination of nature. After World War II, Adorno,

Horkheimer, and Pollock returned to Frankfurt to re-establish the Institute for Social Research, while Lowenthal, Marcuse, and others remained in the United States.

In Germany, Adorno, Horkheimer, and their associates published a series of books and became a dominant intellectual current. At this time, the term “Frankfurt School” became widespread as a characterization of their version of interdisciplinary social research and of the particular social theory developed by Adorno, Horkheimer, and their associates (Wiggershaus, 1994). They engaged in frequent methodological and substantive debates with other social theories, most notably the “positivism dispute,” where they criticized more empirical and quantitative approaches to social theory and defended their more speculative and critical brand of social theory. The German group around Adorno and Horkheimer was also increasingly hostile toward orthodox Marxism and was in turn criticized by a variety of types of “Marxism-Leninism” and “scientific Marxists” for their alleged surrender of revolutionary and scientific Marxian perspectives.

The Frankfurt School eventually became best known for its theories of “the totally administered society” or “one-dimensional society,” which analyzed the increasing power of capitalism over all aspects of social life and the development of new forms of social control. During the 1950s, however, there were divergences between the work of the institute relocated in Frankfurt and the developing theories of Fromm, Lowenthal, Marcuse, and others who did not return to Germany. They often were at odds with both the current and earlier work of Adorno and Horkheimer. Thus it is misleading to consider the work of various critical theorists during the postwar period as members of a monolithic Frankfurt School. Whereas there was both a shared sense of purpose and collective work on interdisciplinary social theory from 1930 to the early 1940s, thereafter critical theorists frequently diverged, and during the 1950s and 1960s the term “Frankfurt School” can really be applied only to the work of the institute in Germany.

Following the lead of Horkheimer and Adorno, other critical theorists such as Fromm, Marcuse, and Habermas also attributed a fundamental role to the media and culture industries in their critical social theories. Their books helped lead many social theorists to perceive the importance of mass culture and communication in social reproduction. Fromm’s first book published in the United States, *Escape from Freedom* (1941), applied the culture industry model to a critique of advertising, mass culture, and political manipulation. After discussing some of the techniques of modern advertising, Fromm notes:

All these methods are essentially irrational; they have nothing to do with the qualities of the merchandise, and they smother and kill the critical capacities of the customer like an opiate or outright hypnosis. They give him a certain satisfaction by their day-dreaming qualities just as the movies do, but at the same time they increase his feeling of smallness and powerlessness. (Fromm, 1941, p. 128)

Fromm then calls attention to how mass communications dull capacity for critical thinking and contribute to the decline of the individual (p. 128), painting a picture of the style of the period:

Vastness of cities in which the individual is lost, buildings that are as high as mountains, constant acoustic bombardment by the radio, big headlines changing three times a day and leaving one no choice to decide what is important, shows in which one hundred girls demonstrate their ability with clocklike precision to eliminate the individual and act like a powerful though smooth machine, the beating rhythm of jazz – these and many other details are expressions of a constellation in which the individual is confronted by uncontrollable dimensions in comparison with which he is a small particle. All he can do is to fall in step like a marching soldier or a worker on the endless belt. He can act; but the sense of independence, significance, has gone. (Fromm, 1941, pp. 131–132)

Fromm (1941) also analyzes how public opinion is shaped by news media and how socialization patterns contribute to the decline of the individual. In 1955, the institute critique of the culture industries plays a central role in both Fromm's *The Sane Society* (1955) and Marcuse's *Eros and Civilization* (1955). Using Freudian and Marxian categories, Marcuse described the process through which sexual and aggressive instincts are tamed and channeled into socially necessary, but unpleasant, labor. Following the institute analysis of changes in the nature of socialization, Marcuse notes the decline of the family as the dominant agent of socialization and the rise of the mass media.

The repressive organization of the instincts seems to be *collective*, and the ego seems to be prematurely socialized by a whole system of extra-familial agents and agencies. As early as the pre-school level, gangs, radio, and television set the pattern for conformity and rebellion; deviations from the pattern are punished not so much in the family as outside and against the family. The experts of the mass media transmit the required values; they offer the perfect training in efficiency, toughness, personality, dream, and romance. With this education, the family can no longer compete. (Marcuse, 1955, p. 97)

In general, the characteristic themes of Marcuse's post-World War II writings build on the Frankfurt School's analyses of the role of technology and technological rationality; administration and bureaucracy; the capitalist state; mass media and consumerism; and new modes of social control, which institute scholars saw as producing both a decline in the revolutionary potential of the working class and a decline of individuality, freedom, and democracy. In Marcuse's view, the mass media were becoming dominant agents of socialization that were displacing the primacy of the family – its role in both Freudian and many US social science theories. The result is the decline of individual autonomy and manipulation of mind and instincts by mass communications:

With the decline in consciousness, with the control of information, with the absorption of individuals into mass communication, knowledge is administered and confined. The individual does not really know what is going on; the overpowering machine of education and entertainment unites him with all the others in a state of anesthesia from which all detrimental ideas tend to be excluded. (Marcuse, 1955, p. 104)

Marcuse continued to stress the manipulative effects of the culture industries in his major works and contributed to the widespread adoption of the so-called “manipulation theory” of the media by the New Left and others in the 1960s.

In *One-Dimensional Man* (1964), Marcuse provides an analysis of the synthesis of business, the state, the media, and other cultural institutions under the hegemony of corporate capital, which he argues characterizes the US economy and polity in the era of “advanced industrial society.” Marcuse claims that the inanities of commercial radio and television confirm his analyses of the decline of the individual and the demise of authentic culture and oppositional thought in “advanced industrial society.” Throughout the book, Marcuse assigns an important role to the media as “new forms of social control” that engender “false needs” and “one-dimensional” thought and behavior necessary for the smooth reproduction of advanced capitalism. Marcuse’s analyses were influential on the New Left that was criticizing and rebelling against a conservative capitalism and imperialism in the 1960s, but with the rise of global revolutionary movements, Marcuse revised his theory of “one-dimensional society” to articulate the new social antagonisms, struggles, and possibilities for change (Kellner, 1984; Marcuse, 2005).

Habermas, the Public Sphere, and the Media

In the 1950s, Jürgen Habermas was strongly influenced by Horkheimer and Adorno’s *Dialectic of Enlightenment*, which he first read in 1955. Habermas resolved to work with Horkheimer and Adorno because he believed they were establishing a dialectical and critical theory of society within a creative and innovative Marxist tradition. He thus went to Frankfurt and continued his studies in the Institute for Social Research and published his first major book, *Strukturwandel der Öffentlichkeit* (1962), which analyzed the rise of the culture industries and decline of the public sphere within liberal democracy. Combining historical and empirical research with the theoretical framework of critical theory, Habermas traced the historical rise and decline of what he called the “bourgeois public sphere” and its replacement by the mass media, technocratic administration, and societal depoliticization.

Habermas’s *The Structural Transformation of the Public Sphere* was published in 1962 and contrasted various forms of an active, participatory bourgeois public sphere in the heroic era of liberal democracy with the more privatized forms of spectator politics in a bureaucratic industrial society in which the media and elites control the public sphere. The two major themes of the book include analysis of the historical genesis of the bourgeois public sphere, followed by an account of the structural change of the public sphere in the contemporary era with the rise of state capitalism, the culture industries, and the increasingly powerful positions of economic corporations and big business in public life. On this account, big economic and governmental

organizations took over the public sphere while citizens became content to become primarily consumers of goods, services, political administration, and spectacle.

Generalizing from developments in Britain, France, and Germany in the late eighteenth and nineteenth centuries, Habermas first sketched out a model of what he called the “bourgeois public sphere” and then analyzed its degeneration in the twentieth century. As Habermas (1989) puts it in the preface to the book, “our investigation presents a stylized picture of the liberal elements of the bourgeois public sphere and of their transformation in the social-welfare state” (p. xix). The project draws on a variety of disciplines including philosophy, social theory, economics, and history, and thus instantiates the Institute for Social Research mode of a supradisciplinary social theory. Its historical optic grounds it in the institute project of developing a critical theory of the contemporary era and its political aspirations position it as critique of the decline of democracy in the present age and a call for its renewal – themes that would remain central to Habermas’s thought.

After delineating the idea of the bourgeois public sphere, public opinion, and publicity (*Öffentlichkeit*), Habermas analyzes the social structures, political functions, and concept and ideology of the public sphere before depicting the social–structural transformation of the public sphere, changes in its public functions, and shifts in the concept of public opinion in the concluding three chapters. The text is marked by the conceptual rigor and fertility of ideas characteristic of Habermas’s writing but contains more substantive historical grounding than much of his work and in retrospect discloses the matrix out of which his later work emerges.

The bourgeois public sphere, which Habermas argues began around 1700, was to mediate between the demands and concerns of social and public life and the private concerns of individuals in their familial, economic, and social life. This involved mediation of the contradiction between *bourgeois* and *citoyen*, to use terms developed by Hegel and the early Marx, overcoming private interests and opinions to discover common interests and to reach societal consensus. The public sphere consisted of organs of information and political debate such as newspapers and journals, as well as institutions of political discussion such as parliaments, political clubs, literary salons, public assemblies, pubs and coffee houses, meeting halls, and other public spaces where sociopolitical discussion took place. For the first time in history, individuals and groups could shape public opinion, giving direct expression to their needs and interests while influencing political practice. The bourgeois public sphere made it possible to form a realm of public opinion that opposed state power and the powerful interests that were coming to shape bourgeois society.

Habermas’s concept of the public sphere thus described a space of institutions and practices between the private interests of everyday life in civil society and the realm of state power. The public sphere thus mediates between the domains of the family and the workplace – where private interests prevail – and the state, which often exerts arbitrary forms of power and domination. What Habermas called the “bourgeois public sphere” consisted of social spaces where individuals gathered to discuss their common public affairs and to organize against arbitrary and oppressive forms of

social and public power. The principles of the public sphere involved an open discussion of all issues of general concern in which discursive argumentation was employed to ascertain general interests and the public good. The public sphere thus presupposed freedoms of speech and assembly, a free press, and the right to freely participate in political debate and decision-making. After the democratic revolutions, Habermas suggested, the bourgeois public sphere was institutionalized in constitutional orders that guaranteed a wide range of political rights and established a judicial system that was to mediate between claims between various individuals or groups, or between individuals and groups and the state.

Many defenders and critics of Habermas's notion of the bourgeois public sphere fail to note that the thrust of his study is precisely that of transformation, of the mutations of the public sphere from a space of rational discussion, debate, and consensus to a realm of mass cultural consumption and administration by corporations and dominant elites. This analysis assumes and builds on the Frankfurt School model of the transition from market capitalism and liberal democracy in the nineteenth century to the stage of state and monopoly capitalism evident in European fascism and the welfare-state liberalism of the New Deal in the United States in the 1930s. For the institute, this constituted a new stage of history, marked by fusion between the economic and political spheres, a manipulative culture industry, and an administered society, all characterized by a decline of democracy, individuality, and freedom. Habermas added historical grounding to the institute theory, arguing that a "refeudalization" of the public sphere began in the late nineteenth century. The transformation involved private interests assuming direct political functions as powerful corporations came to control and manipulate the media and state. On the other hand, the state began to play a more fundamental role in the private realm and everyday life, thus eroding the difference between state and civil society, between the public and private sphere. As the public sphere declined, citizens became consumers, dedicating themselves more to passive consumption and private concerns than to issues of the common good and democratic participation.

While in the bourgeois public sphere, Habermas argued, public opinion was formed by political debate and consensus, in the debased public sphere of welfare-state capitalism, public opinion is administered by political, economic, and media elites who manage public opinion as part of systems management and social control. Thus, while in an earlier stage of bourgeois development, public opinion was formed in open political debate concerning interests of common concern that attempted to forge a consensus in regard to general interests, in the contemporary stage of capitalism, public opinion was formed by dominant elites and thus represented for the most part their particular private interests. Instead of a pursuit for a rational consensus among individuals and groups in the interest of the common good, contemporary politics is characterized by a struggle among groups to advance their private interests.

Hence, Habermas describes a transition from the liberal public sphere that originated in the Enlightenment and the American and French revolutions to a media-dominated public sphere in the current era of what he calls "welfare-state capitalism

and mass democracy.” This historical transformation is grounded, as noted, in Horkheimer and Adorno’s analysis of the culture industry in which giant corporations have taken over the public sphere and transformed it from a sphere of rational debate into one of manipulative consumption and passivity. In this transformation, “public opinion” shifts from rational consensus emerging from debate, discussion, and reflection to the manufactured opinion of polls or media experts. Rational debate and consensus have thus been replaced by managed discussion and manipulation by the machinations of advertising and political consulting agencies where, Habermas (1989) argues, “publicity loses its critical function in favor of a staged display; even arguments are transmuted into symbols to which again one cannot respond by arguing but only by identifying with them” (p. 206).

For Habermas, the function of the media has thus been transformed from facilitating rational discourse and debate within the public sphere into shaping, constructing, and limiting public discourse to those themes validated and approved by media corporations. Hence, the interconnection between a sphere of public debate and individual participation has been fractured and transmuted into that of a realm of political information and spectacle in which citizen–consumers passively ingest and absorb entertainment and information. “Citizens” thus become spectators of media presentations and discourse that mold public opinion, reducing consumer/citizens to objects of news, information, and public affairs. Habermas (1989) argues that “inasmuch as the mass media today strip away the literary husks from the kind of bourgeois self-interpretation and utilize them as marketable forms for the public services provided in a culture of consumers, the original meaning is reversed” (p. 171).

Habermas (1989) offered tentative proposals to revitalize the public sphere by setting “in motion a *critical* process of public communication through the very organizations that mediatize it” (p. 232). He concluded with the suggestion that “a critical publicity brought to life within intraorganizational public spheres” (p. 232) might lead to democratization of the major institutions of civil society, though he did not provide concrete examples, propose any strategies, or sketch out the features of an oppositional or postbourgeois public sphere. Still, Horkheimer found Habermas’s works to be too left wing, in effect rejecting the study of the public sphere as a *Habilitation*s dissertation, and he refused to publish it in the institute monograph series (Wiggershaus, 1994, p. 555). It was published, however, in 1962 and received both an enthusiastic and critical reception in Germany; when translated into English in 1989, it promoted yet more discussion of Habermas and the public sphere, and lively debates continue today (Calhoun, 1993).

Critique and Contemporary Relevance

Like every theoretical conception, the notion of the culture industry was a product of its historical period and its insights and limitations result primarily from the fact

that it theorized features of a particular historical conjuncture. The institute's conception of the role of mass culture and communication was first shaped in the period of Nazi Germany where they witnessed Hitler's extraordinary use of mass communications and fascist spectacles. Obviously, the experience of fascism shaped the critical theorists' views of the rise of a behemoth state and cultural apparatus combined with an eclipse of democracy, individuality, and what they saw as authentic art. And in exile in the United States, they observed President Roosevelt's impressive use of the media and the propagandistic uses of the mass media during World War II. Consequently, political use and control of the media during conditions of warfare, with an enlarged wartime state and subordinate wartime economy, coupled with capitalist control of the entertainment industries, provided the historical roots of the institute model of the culture industry as instruments of social control. Indeed, under this type of militarized social system and war conditions, the media – whether liberal-democratic, fascist, or state socialist – tend to be rather one dimensional and propagandistic. Moreover, the Frankfurt School model of the media and society also rather accurately described certain dominant trends and effects during the Cold War when the media were enlisted in the anti-communist crusade and when media content was subject to tight control and censorship – a situation signaled by Horkheimer and Adorno's allusions to “purges” (1972, p. 123).

The culture industry theory was thus developed in the United States during the heyday of the press, radio, and cinema as dominant cultural forms; it was published just before the introduction of television, whose importance Adorno and Horkheimer, and other members of their group, anticipated. Not only did the Frankfurt School scholars provide an early model of critical communications research, but they were also among the first to see the importance of mass communications and culture for social theory and influenced some of the early attempts to incorporate such themes into critical social theory, influencing C. Wright Mills, David Riesman, and other social theorists to see the multiple functions of the media and mass communications in contemporary culture (Kellner, 1989).

The critique of the culture industry was thus one of the most influential aspects of Frankfurt School critical theory, and its impact on social theory and on theories and critiques of mass communication and culture accounts in part for the continuing interest in the Frankfurt School today. Yet from the beginning, critics of the institute's theory of mass culture stressed the similarity of the critical theory analysis to conservative critics of mass culture and condemned them for their cultural elitism (see Kellner, 1989, 1995). In retrospect, despite their many virtues, there are serious flaws in the original analysis of the culture industry. Overcoming the limitations of the classical model would include: more concrete and empirical analysis of the political economy of the media and the processes of the production of culture; more empirical and historical research into the construction of media industries and their interaction with other social institutions; more empirical studies of audience reception and media effects; and the incorporation of new cultural theories and methods into a reconstructed critical theory of culture and the media. Cumulatively, such a

reconstruction of the classical Frankfurt School project would update the critical theory of society and its activity of cultural criticism by incorporating contemporary developments in social and cultural theory into the enterprise of critical theory.

In addition, the Frankfurt School dichotomy between high culture and low culture is problematical and should be superseded for a more unified model that takes culture as a spectrum and applies similar critical methods to all cultural artifacts ranging from opera to popular music, from modernist literature to soap operas. In particular, the Frankfurt School model of a monolithic mass culture contrasted with an ideal of "authentic art," which limits critical, subversive, and emancipatory moments to certain privileged artifacts of high culture, is highly problematic. The Frankfurt School position that all mass culture is ideological and debased, having the effects of duping a passive mass of consumers, is also objectionable. Instead, one should see critical and ideological moments in the full range of culture and not limit critical moments to high culture and identify all of low culture as ideological (see Bloch, 1986; Jameson, 1979; Kellner, 1995). One also should allow for the possibility that critical and subversive moments could be found in the artifacts of the cultural industries as well as the canonized classics of high modernist culture that the Frankfurt School seemed to privilege as the site of artistic opposition and emancipation. One should also distinguish between the encoding and decoding of media artifacts and recognize that an active audience often produces its own meanings and uses for products of the cultural industries, an argument made by British cultural studies (Hall, 1980; Hall, Hobson, Lowe, & Willis, 1991).

In contrast to the mode of condemnatory criticism associated with Frankfurt School critical theory, many forms of radical cultural criticism today have been developing more complex strategies and attempts to develop more multidimensional approaches to mass culture. Rather than seeing its artifacts simply as expressions of hegemonic ideology and ruling-class interests, it is more useful to see popular entertainment as complex products that contain contradictory moments of desire and its displacement, articulations of hopes and their repression. In this view, popular culture provides access to a society's dreams and nightmares and contains both ideological celebrations of the status quo and utopian moments of transcendence, moments of opposition and rebellion, and its attempted containment. Recent studies of popular culture also perceive how social struggles and conflicts enter into works of popular entertainment and see culture as a contested terrain rather than a field of one-dimensional manipulation and illusion (Kellner, 1995, 2010; Kellner & Ryan, 1988). For example, Kellner (1995) argues that contemporary media culture reproduces social struggles about politics and ideology, gender, race, class, sexuality, and other key issues and has oppositional and critical potential in addition to reproducing dominant ideologies.

Contemporary critical theories of culture and communication must therefore be able to develop more complex methods of cultural interpretation and criticism that pay attention to and conceptualize the contradictions, articulations of social conflicts, oppositional moments, subversive tendencies, and the projection of utopian images

and scenes of happiness and freedom that appear within mainstream commercial culture. The classical critical theory approach, especially Adorno's work, generally limits itself, however, to attacking the ideology and purely retrogressive effects of radio, popular music, films, television, and so on. Moreover, there is a tendency to postulate a passive audience that is the object of ideological domination, resisted, however, by theorists such as Benjamin discussed above.

British cultural studies, by contrast, postulates an active audience that can produce its own meanings and uses for media culture (Hall et al., 1991). Contemporary cultural studies also has expanded the critique of ideology to include gender, race, sexuality, and other dimensions of media texts (Hammer & Kellner, 2009). By contrast, Horkheimer and Adorno's (1972) model of the culture industry does not allow for the heterogeneity of popular culture and contradictory effects, instead straitjacketing popular culture in the form of reification and commodification as signs of the total triumph of capital and the total reification of experience. To be sure, much popular culture (such as Top 40 music and certain Hollywood blockbuster films) lend themselves precisely to Adorno's categories and critique, though, as suggested, certain forms of oppositional music, film, and television resist his categories and require a more complex approach to cultural interpretation and critique.

Contemporary critical approaches to media culture should thus not simply limit themselves to denouncing bourgeois ideologies and escapist functions. Even conservative media culture often provides insights into forms of dominant ideologies and sometimes unwittingly provides images of social conflict and opposition. Studies of Hollywood films, for instance, reveal that this form of commercial culture exhibits a conflict of representations between competing social ideologies over the last several decades (Kellner, 2010; Kellner & Ryan, 1988). Particularly, since about 1967, a variety of competing ideological standpoints have appeared in mainstream Hollywood films. Consequently, there is no one monolithic, dominant ideology that the culture industry promotes, and indeed the conflicting ideologies in contemporary culture industry artifacts point to continuing and intensifying social conflict within capitalist societies.

However, precisely the critical focus on media culture from the point of view of commodification, industrialization, reification, ideology, and domination provides a perspective useful as a corrective to more populist and uncritical approaches to media culture that surrender critical perspectives, arguments made by Gunster (2004) and Steinert (2003). In contrast to approaches that displace concepts of ideology and domination by emphasizing audience pleasure and the construction of meaning, the Frankfurt School is valuable for inaugurating systematic and sustained critiques of ideology and domination within the culture industry, indicating that it is not an innocent "creative industry," as certain contemporary idioms would have it. The notion promoted by Hartley (2003) and other proponents of the "creative industries" model provides an ideological gloss of positivity on media industries. Such perspectives suggest media are inherently bastions of enlightenment, creativity, and abundance, and in opposition to this conception, one might prefer the Horkheimer and Adorno notion of "culture industry" that is more descriptive and critical.

Moreover, on the level of metatheory, the Frankfurt School work preceded the bifurcation of the field of media and communication studies into specialized sub-areas with competing models and methods. For the Frankfurt School, the study of communication and culture was integrated within critical social theory and became an important part of a theory of contemporary society in which culture and communication were playing ever more significant roles. Hence, despite its limitations, the Frankfurt School theory of the culture industry contains several novel features and makes many important contributions to the study of mass communications and culture. Critical theory conceptualizes culture and communications as part of society and focuses on how socioeconomic imperatives helped constitute the nature, function, and effects of mass communication and culture. By conceptualizing these important cultural and social forces as part of socioeconomic processes, critical theory integrates the study of culture and communication with the study of the economy and society. By adopting a critical approach to the study of all social phenomena, critical theory is able to conceptualize how the culture industry serves as an instrument of social control and thus serves the interests of social domination.

On the whole, later critical approaches to the media and culture within the contemporary academic division of labor tended to separate communications research from the study of mass culture, thus failing to provide a unified account of cultural production, distribution, and reception (see Hammer & Kellner, 2009). Consequently, critical theory is more than a piece of history because it contains a unified and critical approach to the study of culture and communication within the context of critical social theory that engages the political economy of culture and communication, analysis of texts, and the study of audience reception. Likewise, its mode of cultural criticism situates artifacts of analysis within the context of their social environment and uses social theory to help interpret cultural artifacts while using culture to help decipher social trends and processes. The institute's use of psychoanalytic theory leads them to decipher cultural works as exhibiting traits of individual and social psychology as well as sociohistorical content. However, despite its contributions, there are serious limitations to the Frankfurt School model, for much of their criticism of popular culture limits itself to denunciation of its ideological features. Yet because much in popular culture deserves and demands severe condemnation, critical theory ideology critique provides some useful tools for cultural criticism, although it also suffers the limitations mentioned above.

Finally, in an era of media concentration in which giant corporations own media empires that are dedicated to profit and advance the interests of media corporations (McChesney, 2007), the Frankfurt School theory and critique of the culture industry continues to be relevant. Yet Frankfurt School ideology critique tended to focus on the dominant capitalist-bourgeois ideology, and ideology critique today should be expanded to encompass gender, race, sexuality, religion, and other determinants of identities that are often produced in media culture (Kellner, 1995, 2010). Thus while the Frankfurt School critique of the culture industry needs to be expanded and reconstructed, it is still relevant in societies dominated by corporate media and consumer society.

The Rise and Fall of the Limited Effects Model

Peter Simonson

ABSTRACT

This chapter revisits the history of the so-called “limited effects model” of mass communication, associated with Paul Lazarsfeld and Columbia University’s Bureau of Applied Social Research. It argues that the model was in part a rhetorical invention of its critics in the 1970s and 1980s, when critical and cultural approaches to media studies were gaining widespread traction and a new generation of objectivist social scientists were carving out alternatives to inherited understandings. Pivoting from that moment of invention, it returns to Columbia research of the 1940s and 1950s, traces the rise and alternate understandings of the model, and contextualizes it in relation to competing approaches to media at Columbia frequently occluded in collective memories of the field.

Something named the “limited effects model” of mass communication did not emerge before the 1970s, at the very moment it was being called into question. Indeed, “limited effects” seems to have been a locution favored, if not invented, by its critics, who sometimes mischaracterized it and exaggerated its dominance as a paradigm governing media research in the previous decades. The story of its rise, fall, and continued life extends from the 1940s to the present and provides a window into broader stories about the intellectual and institutional development of media

studies in the second half of the twentieth century. It is a story about the perceived mainstream of social scientific media studies in the postwar era, which intersects with a number of the other foundations, moments, and approaches discussed in this volume. It grew up in an assemblage centered upon Columbia University, whose sociology program in the 1940s would come to rival – and eventually surpass – the University of Chicago's. The assemblage centered around Paul Lazarsfeld (1900–1976) and the Bureau of Applied Social Research (known as the Office of Radio Research before 1945), heirs like the University of Chicago to Enlightenment projects of scientifically oriented knowledge production and ideologically committed to pluralistic liberalism and social democracy. They would develop their so-called limited effects model through empirical studies of decision-making behavior related to the media of the early 1940s – radio, newspapers, magazines, and motion pictures. Emerging from studies funded by commercial and government agencies, the model articulated with a distinct political economy of research and thinking. Built upon the intellectual labor of women and ethnic outsiders, the model trails a distinctive and mostly unacknowledged social history. Named and taken to task in the 1970s by Marxian critical and cultural scholars (as well as critics from within the ranks of objectivist social science), the limited effects model reveals some of the main fault lines and boundary disputes of media studies since then. Revisiting it allows us to check and correct our collective memories of the field and also to reflect on elements of classic Columbia research that have been revived and extended in our own time.

First a word about definitions. The notion of “limited” media effects indexes several overlapping but analytically distinct ideas, frameworks, and propositions which are not always distinguished in discussions of the model. On the one hand, “limited” can mean minimal, as in the idea that “the media are not very important in the formation of public opinion,” as Todd Gitlin (1978, p. 207) put it in his carefully documented and very influential critique. “Limited” in this sense could be contrasted with “powerful” effects, a meaning Elisabeth Noelle-Neumann (1973) operated with implicitly when she introduced her alternative paradigm for understanding media, soon to be called the “spiral of silence” theory. Alternatively, “limited” can refer to an absence of direct effects, meaning that media influence on audiences is generally limited by social and psychological filtering mechanisms – “[s]elective attention, selective perception, selective retention, selective recall,” for instance, in addition to membership in groups whose beliefs and cultural stereotypes condition response to mass media (Bauer, 1973, pp. 143, 148). These mediating devices, often captured under the headings of selectivity and interpersonal relations, are said to limit the kind and amount of influence that media might exercise on individuals. More precisely, selectivity and interpersonal relations are said to limit the ability of the media to *change* people's attitudes, opinions, and behaviors. In both inflections, “limited effects” has typically been linked to the two-step flow model of communication – the idea that media campaigns and information flow to local opinion leaders who in turn pass them on to others via face-to-face talk. In its classic formulations in the 1940s and 1950s, the two-step flow model was linked with research data that

indicated that interpersonal influence exercised a stronger force than mass media on the opinion formation and decision-making of individuals. In comparison with people around us, then, media were said to have relatively limited effects. Critics would jump on that conclusion, the research methods that fed it, and the broader view of media, power, and society that underwrote it.

In this chapter, I will sketch the rise, fall, and recent revivals of components of the limited effects model. I'll launch the tale in the 1970s, when Gitlin and others named and historically amplified its significance as they advanced their own alternative understandings and theoretical approaches. From there, I will turn back to the emergence, consolidation, and diffusion of the two-step flow and limited effects ideas at Columbia and elsewhere from the 1940s through the 1960s. Among other points, I will show how it was built on an empirical base of women's talk, took initial shape as one model among several at Columbia, and rose to a position of rhetorical power – though not, I argue, clear or overwhelming dominance. I'll then go on to trace developments and criticisms of the semi-independent two-step flow and limited effects ideas in the 1960s and early 1970s, before Gitlin and other paradigm-shifting critics weighed in. From there, I consider ways that the “limited effects model” came into symbolic focus and did historical and rhetorical work in the 1980s and after, in addition to reflecting on ways that some of its core insights have reappeared in ways we have come to think about audiences, communicative flows, and networks today.

“Limited Effects”: Birth in Death

Before 1975, the term “limited effects” was rarely, if ever, used to name a model or paradigm for understanding media. It entered academic parlance over the next several years, and within a decade it had become a commonplace in media studies. It gained that status through work done by critics, some of whom marshaled the label explicitly, others who energetically questioned the findings, focus, and overarching framework it pointed to. Among the earliest adopters of the term was Steven Chaffee, the Wilbur Schramm-trained student of mass communication and politics whom one observer called “the outstanding communication research scholar of his generation” (Alexander, 2001).¹ Operating from the horizons of positivist, objectivist social science, Chaffee took a shot at the model in the ground-clearing introduction to his edited 1975 volume, *Political Communication*. “This book has been produced by social scientists who are willing to assume, in some degree or another, that the study of political communication needs to be approached from fresh intellectual perspectives, and with new tools,” he announced (p. 15), before moving on to specify his intellectual target:

At least since the publication in 1960 of [Joseph] Klapper's major synthesis of the Columbia University findings of only limited political effects of the mass media, it has been typical in academic circles to assume that communication campaigns can make

only minor dents in the political edifice. Citizens' processing of media information has been thought to be highly selective, conditioned by partisan predispositions, and subordinate to interpersonal influences (the "two-step flow"). Almost any message received, so it seemed, would stand a good chance of having at most the net effect of reinforcing the person's existing cognitive state. This limited effects model is simply not believed by the authors of the chapters that follow. The possibility that media effects on politics are only minor remains, but it is not *assumed* in this book. Instead many of these chapters are devoted to an analysis of the narrow range of studies from which limited effects have been inferred – and to proposing alternate directions for research that might demonstrate how limited the limited-effects model is. (Chaffee, 1975, p. 19)

Chaffee had been investigating the media's role in political socialization of the young for several years at that point, and had come to recognize the part it played in increasing political knowledge for those who paid attention to it (e.g. Chaffee, Ward, Scott, & Tipton, 1970). Now he was naming his foe, not yet sure whether to hyphenate the phrase "limited effects," but about to push forward with a series of criticisms of the model's deficiencies in understanding the fuller range of relations among media and politics, culminating in a thoroughgoing critique-cum-historical reconstruction of the model under the rubric of "the beginnings of political communication research in the United States" (Chaffee, 1977, 1978; Chaffee & Choe, 1980; Chaffee & Hochheimer, 1985; Chaffee & Wilson, 1977).

While Chaffee criticized "limited effects" as a model for political communication, the young critical media sociologist Todd Gitlin would cast it in broader relief – as the dominant model for media research writ large – in his thoroughgoing and influential critique, "Media Sociology: The Dominant Paradigm" (1978). Gitlin didn't use the new "limited effects" label, but his eloquent opening salvo made clear what his target would be: "Since the Second World War, as mass media in the United States have become more concentrated in ownership, more centralized in operations, more national in reach, more pervasive in presence, sociological study of the media has been dominated by the theme of the relative powerlessness of the broadcasters" (p. 205). Shortly thereafter, Gitlin made a powerful identifying assertion: "The dominant paradigm in the field since World War II has been, clearly, the cluster of ideas, methods, and findings associated with Paul F. Lazarsfeld and his school: the search for specific, measurable, short-term, individual, attitudinal and behavioral 'effects' of media content, and the conclusion that media are not very important in the formation of public opinion. Within the whole configuration," he went on, "the most influential single theory has been, most likely, 'the two-step flow of communications'" (p. 207).

Gitlin proceeded to unleash a devastating critique of Lazarsfeld, the dominant paradigm, and the field that was shaped by them, which he traced from *The People's Choice* (Lazarsfeld, Berelson, & Gaudet, 1944), the classic Columbia study of the 1940 presidential election campaign, through Klapper's "definitive compilation of the field's early stages" in *The Effects of Mass Communication* (1960). He devoted most of his attention however to Elihu Katz and Lazarsfeld's *Personal Influence* (2005), based

upon a 1945 study in Decatur, Illinois. Gitlin (1978) called it “the founding document of an entire field of inquiry” (p. 208), codifying the two-step flow model, its attention to short-run changes in individual attitudes and behavior, and its conclusion that media power was limited in comparison to interpersonal influence. Gitlin traced the model back to its origins in marketing research and its self-proclaimed advance over what he called an “earlier ‘hypodermic’ theory” in which society is conceived as a “mass society, and mass communications ‘inject’ ideas, attitudes, and dispositions toward behavior into passive, atomized, extremely vulnerable individuals” (p. 210). He critiqued its “administrative” mentality attuned to the needs of marketers and political campaigners and directing its narrow, positivist attention to influences on individual decisions to buy soap or vote for a candidate, and he argued that its conclusions about limited media power were unsupported by the facts marshaled for it. More broadly, he claimed that the view had the effect of deflecting attention from media as they operated at the macro level – e.g., in defining shared reality, establishing and undercutting the legitimacy of institutions and movements, and shaping political agendas and public images. The paradigm reflected an “abstracted empiricism [. . .] concretely founded on the prevailing political and commercial culture” (p. 240), and indirectly doing “its share to consolidate and legitimize the cornucopian regime of mid-century capitalism” (p. 245).

Gitlin’s critique flew at the dawning of a new moment in media studies, and what he called “the beginning of the decomposition of the going paradigm itself” (p. 206). As evidence, he cited Chaffee’s *Political Communication* (1975), Maxwell McCombs and Donald Shaw’s “Agenda-Setting Function of the Mass Media” (1972), and “in England, the alternative approach of cultural studies,” mentioning Stuart Hall’s work among others (Gitlin, 1978, p. 246, n.2; compare Gouldner, 1976, pp. 149–150). Hall would weigh in with his own influential critique of Lazarsfeld a few years later, pivoting from it to announcing “the rediscovery of the ideological dimension” by “the critical paradigm in media studies” then being revived by cultural studies (Hall, 1982, p. 65). Gitlin might have drawn evidence for the decomposition of the paradigm from other sources as well, including the right-leaning German public opinion researcher and theorist Elisabeth Noelle-Neumann (1973), who had advocated a “return to the concept of powerful mass media.” Drawing on openings provided by the British sociologists Jeremy Tunstall (1970) and Halloran, Elliot, and Murdoch (1970), Noelle-Neumann asked if researchers were asking the right questions about media, and sought (like Gitlin and others would) to broaden the frame to consider macro-level issues. Observing the news media’s ability to create a climate of public opinion and macro-level cumulative effects, she called into question the idea of audience selectivity, and argued that the media had the power to initiate what she would soon call a “spiral of silence” whereby those who perceived themselves to hold minority positions not favored in journalistic coverage would remain quiet about them, and the supposedly dominant views would grow in support and relative standing. Her critique meant that the limited effects model was attacked from left, right, and center; and from both within and beyond the borders of objectivist social science.

As it emerged from critiques and characterizations in the 1970s and early 1980s, the “limited effects” model was given a history. It was said to have arisen in the 1940s, marking the end of a more speculative period of propaganda research that tended to inflate media power (sometimes captured by the “hypodermic” image), and the beginning of a new era of methodologically sophisticated empirical social scientific study. It was associated with Paul Lazarsfeld (nearly always the central character in the story), Columbia University, and the Bureau for Applied Social Research. It came into focus across three books – *The People’s Choice* (Lazarsfeld et al., 1944), *Personal Influence* (Katz & Lazarsfeld, 2005), and *The Effects of Mass Communication* (Klapper, 1960), the first introducing the two-step flow model, and the second two consolidating it into the limited effects paradigm. It was said to have dominated the field – either of media studies writ large, or political communication more specifically. And it was widely considered to be inadequate as a theory – insufficiently supported by its own evidence, narrowly focused on short-term individual-level effects brought about by purposive media campaigns, and blind to broader collective and institutional dimensions of media in modern societies. While there was truth in the history and characterizations of the model, there were overstated, misleading, and strategically selective elements as well. To get a clearer sense of the origins and development of the model, I’d like to turn back to the 1940s and 1950s and sketch pieces of the social, intellectual, and rhetorical history of its central texts and key components.

Birth of the “Two-Step Flow”: *The People’s Choice* and Its Columbian Rivals

In the summer of 1940, a dozen or so women living in Erie County, Ohio laid the groundwork for what others would call the “dominant paradigm.” They were working with Elmo Wilson and Hazel Gaudet, who had taken up residence in Sandusky and were overseeing a major study conducted by Lazarsfeld’s Office of Radio Research (ORR), which had just moved from Newark to Columbia. Also collaborating was Elmo Roper, the pioneering marketing and public opinion survey researcher who at the time headed the *Fortune Survey*. Funded by the Rockefeller Foundation and money Lazarsfeld drew from marketing and consulting work done at the ORR, the Erie County study was an ambitious effort at tracking the interplay of political propaganda, public opinion, and voting behavior over the course of the 1940 presidential election campaign.

Between May and November, the specially trained local women knocked on the door of every fourth house in Sandusky and the rural towns of the county, recruited 3,000 local citizens, and interviewed each one multiple times during the unfolding presidential campaign. They gathered a wealth of information about each respondent, recorded their political preferences and communicative involvement in the campaign, and followed up with open-ended questions when someone reported changing

their vote intention in any way. War raged in Europe, France fell to the Nazis, and President Roosevelt campaigned for an unprecedented third term in office against the Midwestern Republican businessman Wendell Wilkie. The Erie County women made use of a still-new method of public opinion research recently codified by Lazarsfeld and Marjorie Fiske (1938), the “panel technique,” which utilized multiple interviews of the same respondents over time. In contrast with polling data, panels had the advantage of being able to track changes in opinion as they unfolded during a political campaign. The research team hoped to correlate changes with “exposure to campaign propaganda in all the media of communication – the press, radio, personal contacts, and others” (Lazarsfeld, Berelson, & Gaudet, 1944, p. 5).

Published four years later, *The People’s Choice* offered a snapshot of how campaign propaganda and informal face-to-face communication intersected with opinion formation and voting in a real-world setting. Scattering quotes from respondents with statistical charts of survey data (designed by the advertising agency McCann Erickson) and larger-bore narratives about the geographical setting and historical context for the campaign, Lazarsfeld, Berelson, and Gaudet (1944) charted among other things the ideological differences (their term) between the parties, the appeal of class-based argument, and the gendered ecology of attention and social influence during the campaign season. The book became a classic work in voting studies and public opinion research.

While change in voter intentions particularly interested them, they identified and discussed at least three major categories of effects brought about by what they called “the speeches, the events, the writings, the discussions, the total propaganda output” (p. 101). “The campaign activated the indifferent, reinforced the partisan, and converted the doubtful” (p. 101), in addition to creating a “bandwagon effect” (which sounds something like Noelle-Neumann’s spiral of silence) (pp. 107–109). Reinforcement was the main effect (occurring in 53% of the panel members), but more than 30% of the effects fell into categories that don’t fall comfortably within the limited effects model – conversion and activation (p. 103).

Beyond a study of voting behavior and opinion formation, *The People’s Choice* is a book about “propaganda,” as it reminds us from start to finish. The book’s two lasting ideas – opinion leaders and the two-step flow – emerge out of that problematic. In that regard, the book indexes a transition moment between two paradigms and overarching signs – *propaganda* and *communication* (on which, see Sproule, 1997, pp. 217–223; Collins, Chapter 27, this volume). That transition would continue through most of the 1940s, with Columbia’s work straddling both worlds – the civically engaged and publicly critical model of propaganda research, and the more removed or disengaged model of objectivist social science (compare Sproule, who puts Columbia firmly on the latter side). The book revolves around propaganda, as propagated through both mass media and face-to-face life. Through the 1940s, social democratic intellectual engagement vied with professionalized liberal objectivism as orienting ideologies governing communications and media research at Columbia (Simonson, 2010, pp. 141–161; Simonson & Weimann, 2003).

“Opinion leaders” straddled both worlds – more exposed to campaign propaganda in the media, and more engaged in talking about it with others. The concept was applied to anyone who answered yes to one of two questions raised by the interviewers: “Have you tried to convince anyone of your political ideas recently?” or “Has anyone asked your advice on a political question recently?” (Lazarsfeld, Berelson, & Gaudet, 1944, p. 50). (Twenty-one percent of their sample were designated “opinion leaders.”) They played a key role in “the two-step flow of communications” (plural in this first iteration), which named the way that “ideas often flow *from* radio and print *to* the opinion leaders and *from* them to the less active sections of the population” (p. 151). When local citizens reported that they changed their minds about something, they often made reference to interpersonal conversation, the authors found. The two-step flow helped explain that specific finding: “The person-to-person influence reaches the ones who are more susceptible to change, and serves as a bridge over which formal media of communications extend their influence” (p. 152).

The opinion leader and two-step flow ideas took shape within a book that functioned in the propaganda debate as a kind of democratic apologetic. Opinion leaders, the text announced (and Lazarsfeld consequently amplified), were “found in all occupational groups” (p. 50). Never mind that the chart they produced showed enormous differences among occupations in the prevalence of designated “opinion leaders” (44% of salesmen as opposed to 13% of housewives and 15% of the unemployed, for instance), the official rhetoric of opinion leadership suggested a democratic otherwise. The two-step flow played a similar function, suggesting that propaganda from the mass media might be refracted through the good sense of locals who pass it on to their friends. The moral of the story was clear in the book’s upbeat, democratic close: “In the last analysis, more than anything else people can move other people. From an ethical point of view this is a hopeful aspect in the serious social problem of propaganda. The side which has the more enthusiastic supporters and which can mobilize grass-root support in an expert way has a great chance of success” (p. 158). Limited media effects, in other words, were coupled with a vision of the power of grassroots organizing, and the hope that democratically supported propagandas might win the day.

When it came out in 1944, *The People’s Choice* was far from the most notable study of media produced by Columbia. That title belonged to *Radio Research 1942–1943* (Lazarsfeld & Stanton, 1944), which gave a varied and compelling picture of a field the editors saw on its way to merging “with the study of magazines, newspapers, films, and television into one broader discipline of communications research” (p. vii). Articles by Herta Herzog, Frankfurt School émigré-in-residence Leo Lowenthal, and others addressed everything from the characters and “listening gratifications” of soap operas to the popular music industry and the historical and cultural meaning of biographies in popular magazines, in addition to a series of articles about methodological issues and applications of the so-called Lazarsfeld–Stanton Program Analyzer, a kind of primitive polygraph machine that allowed researchers to determine when members of small test audiences liked or disliked parts of a radio broadcast or film.

With its range of media, topics, methodologies, and conceptual orientations, *Radio Research 1942–1943* ushered in modern media studies. Meanwhile, when *Radio Research* emerged from the presses, Lazarsfeld's colleague and longtime collaborator Robert K. Merton was in the midst of a study of a series of all-day radio marathons conducted by the patriotic icon and celebrity Kate Smith, which would yoke in-depth qualitative interviews with middle-range and larger-bore sociological theory and symbolic and ideological analysis (on middle-range theory, see Boudon, 1991). The result, *Mass Persuasion* (Merton, Fiske, & Curtis, 1946), signaled the birth of a cultural sociology of media, manifest with restrained critical civic impulses that channeled both Marx and Dewey. Neither *Radio Research* nor *Mass Persuasion* worked with the two-step flow / opinion leader ideas, nor did either feed straightforwardly into the limited effects paradigm.

Through the 1940s, media study at Columbia was a rich and internally diverse project – committed not just to “effects” studies, but also to probing qualitative inquiry into audiences’ social and psychological “gratifications” as well as the “functions and dysfunctions” of mass communication. “Effects” was Lazarsfeld’s preferred idiom, reflecting long-standing interest in determinants of individual action, his statistical acumen in investigating them, and a theoretical sensibility that blended European positivism and US pragmatism and rallied around the ideal of objectivist science as a potentially meliorative social force. In focusing on effects, he aligned himself with both the University of Chicago’s Douglas Waples and the polymath political scientist Harold Lasswell (1948), who generated the architectonic scheme for communication as a study of “who, says what, in which channel, to whom, with what effect?” While campaign research like *The People’s Choice* tended to focus on short-term media effects, Lazarsfeld actually aspired to address long-term and institutional effects as well (Katz, 2001; Lazarsfeld & Merton, 1948). Merton was less apt to write about “effects,” as was Herta Herzog (who left the ORR in 1943 to head the research department at McCann Erickson, where she disseminated media research techniques into advertising and marketing [see Gladwell, 1999]). Besides the Kate Smith study, Merton’s functionalist analysis is best exemplified in his superb 1948 essay with Lazarsfeld, which posits three middle-range concepts to describe ongoing media processes – enforcing social norms, conferring public status, and narcotizing citizens (Lazarsfeld & Merton, 1948; see Simonson & Weimann, 2003). Herta Herzog (1940, 1941, 1944), meanwhile, pioneered the study of audience gratifications, which she worked out through a deep understanding of psychology as understood by Karl and Charlotte Buhler, Hadley Cantril, and Freud. Bernard Berelson (1949) would move the gratification paradigm in more social dimensions in his classic study of a 1945 newspaper strike. Through the 1940s, then, the limited effects paradigm wasn’t even dominant at Columbia, much less the rest of the overlapping fields of propaganda, public opinion, and mass communications research.

There was diversity at Columbia, but also a family resemblance across research projects which distinguished them from other approaches represented in this volume and from earlier versions of social research at Columbia. Lazarsfeld and Merton set

the tone for an objectivist, scientifically guided style that blended sophisticated methodology, carefully articulated middle-range concepts, and a blend of qualitative and quantitative empirical research guided by them. It was both more professionalized and more advanced methodologically and theoretically than the publicly oriented work of the man who helped hire them, Robert S. Lynd, co-author with his wife Helen of the landmark *Middletown* studies of the 1920s and 1930s that presented US citizens with a social portrait of themselves. Lazarsfeld and Merton operated in a different intellectual style, also well distinct from that practiced by the Frankfurt School's Max Horkheimer and Theodor Adorno, who took up residence at Columbia for a time in the early 1940s in one of those meetings-of-the-paradigms that has become canonical in historical tales of media research (e.g., Morrison, 1978; see also Wheatland, 2009). Lazarsfeld (1941) himself tried to mediate the differences between what he termed "critical" and "administrative" media research, and both Merton and the Frankfurt School's Leo Lowenthal made efforts to do some of the same (on which, see Merton, 1968, pp. 493–509). In contrast with the Frankfurt group, the Columbians were less historical in their writings on media (though Merton's work typically cast mass communication in some historical perspective), less apt to situate media within a larger social order, more empirically positivist, and more attuned to audiences than industries (for a fascinating exception from Columbia, see Smith, 1945). Marxian and Freudian insights are scattered across classic Columbia writings from the 1940s, but as trace elements among an eclectic array of theoretical influences that also include Durkheim, Gabriel Tarde, Adolphe Quetelet, Talcott Parsons, and the pragmatists. It is worth remembering, too, that whereas Horkheimer's Institute for Social Research had a rich endowment that supported it, Lazarsfeld's Bureau needed to support itself in an era when foundations and funding agencies were just beginning to provide grants to the social sciences. This need would affect the kind of research the group did. *The People's Choice* was funded by the Rockefeller Foundation, which was broadly concerned with US culture and civic life; by *Life* magazine, which was interested in the influence of its publications; and by income generated by commercial marketing research done by the Bureau. A large subsequent study in Decatur, Illinois – about which more in a moment – was in turn funded largely by the magazine publisher Macfadden Publications, financially driven by the marketability of the two-step flow model to commercial funders (Morrison, 2006).

Beyond its differences from the Frankfurt group, Columbia differed from Chicago in several ways, too. For one thing, Columbia conducted far more funded research than its Midwestern rival, organizing larger-scale research-team projects of the sort represented by their community based voting and social influence studies. (The most famous team-based media project at Chicago in the postwar era – Kurt and Gladys Lang's [1968] classic study of the live-crowd vs. televisual experience of the MacArthur Day parade – was conducted by graduate student volunteers who set themselves up around the parade route.) Besides their differing political economies, Chicago-style research tended to work in a broadly symbolic interactionist tradition, attending to

cultural meanings, dramatic enactments, and community formations related to media and communication. Merton's Kate Smith study and Herzog's early work on soap opera listeners certainly attended to meaning-making and related cultural issues, but the mainstream of empirical research at Columbia attended more to flows of influence and behavioral effects brought on through mass media. Beyond the specific details and fault lines at Columbia that I have been charting, it is important to keep an eye on the bigger picture as well.

Personal Influence and Two-Step Flows in the 1950s

In the summer of 1945, women in Decatur, Illinois performed the communicative labor that led a decade later to the publication of Katz and Lazarsfeld's *Personal Influence*, which more than any other text narrowed the conceptual landscape of Columbia media research and established the limited effects model. The study was funded by Macfadden Publications, publisher of, among other periodicals, the popular lowbrow women's magazine *True Story* and the general interest *Liberty* magazine, on whose editorial pages Bernarr Macfadden had once boasted that he had "more influence politically on the masses than any one individual in the United States" quoted in Simonson, 2006, p. 12). *True Story* had commercial interest in the two-step flow idea, along with the finding that opinion leaders operated in all social strata – both of which served as fodder to persuade advertisers that there were valuable multiplier effects to running ads with them. *Time* magazine had funded a similar study a year earlier, searching out what Merton would re-name "influentials" in his administrative and scholarly write-ups of his field study in Dover, New Jersey (Merton, 1943, 1949).

In January 1945, Lazarsfeld and Merton hired a young C. Wright Mills to oversee field research in Decatur (Summers, 2006, pp. 28–29). He would work with Helen Dinerman and Thelma Ehrlich, two researchers at the newly renamed Bureau of Applied Social Research, trained in the panel technique by Jeannette Green. They would recruit some 15 local women to conduct repeated interviews with 800 Decatur women to determine how they made up their minds about marketing and political decisions (Douglas, 2006). It was the first time Mills had overseen a large empirical study, and it would be the wedge that drove him and Lazarsfeld apart, setting in motion one of the defining intellectual breaks in postwar sociology (Summers, 2006). Among their differences, Mills found the structure of opinion leadership and interpersonal influence to be less democratic than Lazarsfeld had been trumpeting since *The People's Choice*.

After more than a decade of travails following the field study in Decatur, *Personal Influence* was published. Through rhetorically compelling narratives that served to magnify its own significance, *Personal Influence* invented one of the most persistent – and inaccurate – accounts of the history of media research, and helped convince

a number of readers that mass media were not in themselves important social forces. Though it nowhere uses the term “limited effects,” *Personal Influence* laid out a problematic and tropes that – amplified by Katz, Klapper, and other former Columbia graduate students – settled into the limited effects model. It was really two books in one. Part I, “The Part Played by People: A New Focus for the Study of Mass Media Effects,” was a revision of Katz’s dissertation, which was in turn an extension of a report he wrote for a major but unpublished study of US television funded (and later killed) by the Ford Foundation (Katz, 1953; Morrison, 2000; see also Buxton, 2009). It presented a tale of discovering “intervening variables” in effects of mass communication, including the variable of interpersonal relations and opinion leaders, and consolidated Columbia research on the topic, including their second community based voting study (Berelson, Lazarsfeld, & McPhee, 1954). It also included a highly influential history of the field, which purportedly grew from an era when the audience was conceived as “an atomistic mass of millions of readers, listeners, and movie goers prepared to receive the Message,” and “every Message [was seen] as a direct and powerful stimulus to action which would illicit immediate response” (Katz & Lazarsfeld, 2005, p. 16). This image would later be associated with the “hypodermic model” Gitlin referenced, though it was essentially a straw man that referenced no actual earlier work. As Jefferson Pooley (2006) and Debora Lubken (2008) have convincingly shown, *Personal Influence* invented a flawed “other” to which it claimed superiority. Something analogous would happen in the 1970s when the “limited effects model” was rhetorically mobilized by its critics.

Meanwhile, the second part of *Personal Influence*, “The Flow of Everyday Influence in a Midwestern Community,” presented and interpreted the decade-old data from Decatur in a manner that has been roundly criticized by social scientists and critics since. Relying on self-reports of the Decatur women, it concluded that interpersonal influence was more important than mass media in decisions made about shopping, movie-going, fashion, and public affairs. It analyzed opinion leadership in those four realms, and concluded with consideration of the two-step flow and interpersonal influence. Like *The People’s Choice*, *Personal Influence* fits nicely into a liberal pluralist worldview and presented a reassuring picture to mid-century US citizens – opinion leaders came from all social strata and through face-to-face conversation helped limit the force of mass media; the book functioned as a democratic apologetic in the face of fears of a mass society (McCormack, 2006; Scannell, 2006). Some reviewers criticized the evidence advanced as support for the two-step flow theory, but most accepted the book’s claim that interpersonal outweighed media influence in individual decision-making. Kurt and Gladys Lang (2006) have argued that the book “heralded a clear shift in the rhetoric” of sociologists and political scientists surrounding the importance of mass communication and toward a “‘minimalist’ view of media effects” that pushed out alternative conceptions (pp. 165, 167). These included the broadly symbolic interactionist perspectives developed by the Langs and others at the University of Chicago, which mapped alternative paradigms of media sociology (Lang & Lang, 1961, 1968).

Though the minimalist view of media power shifted the academic rhetoric, the model actually contained two overlapping ideas, one of which could also support theories of more robust media power. On the one hand, the claim that selectivity and group norms limited the direct influence of mass media fed a conclusion supported across Columbia research, captured in a statement from a summary article of 1957: "Mass communication does not serve as a necessary and sufficient cause of audience effects, but rather functions among and through a nexus of mediating factors and influences [. . . which] typically render mass communication a contributory agent, but not the sole cause, in a process of reinforcing of existing conditions" (Klapper, 1957, p. 458). "Reinforcing existing conditions" could be taken as the start of a theory of media and ideological hegemony, a direction Lazarsfeld and Merton (1948) feinted toward a decade earlier (Simonson & Weimann, 2003). But *Personal Influence* dialed the resolution of the viewing frame down to the individual, short-term, and decision-making level, occluding the bigger picture, and downplaying the relative significance of mass media as a social force.

The two-step flow idea could be put to other uses, however. Beyond suggesting the interpersonal mediation and therefore limits of media power, it also pointed toward diffusion, larger-scale communicative flows, and social mechanisms of enhancing media effectivity. In this iteration of the two-step flow, media campaigns combined with word-of-mouth diffusion to cascade through social networks. Running alongside rhetoric of comparatively limited media influence, then, Columbia researchers also lay down a vision of communication in a networked society. In this regard, the Columbia paradigm merged with diffusion studies conducted by rural sociologists, with work in international development, and with psychological warfare efforts coordinated by the US government in collaboration with communication researchers (Simpson, 1994), all of whom looked at conversations as potential multipliers of media influence.

The opinion leader, interpersonal influence, and flow-of-communication ideas had entered the state-sponsored Cold War arsenal of psychological warfare by the late 1940s. Frankfurt School émigré and former Bureau affiliate Leo Lowenthal had become research director of the Voice of America, which funded opinion leadership and audience studies in Norway, Sweden, and other European and Latin American countries in 1948–1949, explicitly understood as a contribution to "psychological warfare" (Klapper & Lowenthal, 1951). Two years later, the Voice of America funded similar survey work in the strategic Near East countries of Turkey, Lebanon, Egypt, Syria, Jordan, and Iran, collecting information about media behavior and seeking out opinion leaders in towns and cities. At the same time, the Bureau prepared a survey research manual, *Are We Hitting Our Target?*, for an immediate predecessor of the US Information Agency, whose mission was to influence foreign publics in the US national interest; it guided opinion leader studies in the Philippines and elsewhere (Simpson, 1994, p. 73). The Near East study would be published as Daniel Lerner's (1958) *Passing of Traditional Society*, an infamous articulation of modernization theory as well as a fascinating historical portrait of communication, politics, and society in

those six still-important countries. Snapshots of opinion leadership are captured throughout (e.g., pp. 26–28, 185–196, 245–246, 333–338).

In the meantime, University of Washington sociologist Stuart Dodd and graduate students like Melvin DeFleur advanced the mass communication and interpersonal flow model through studies of airplane leaflet drops for the US Air Force and covertly funded by the CIA. Their Project Revere study (1951–1953) was a rather remarkable series of field studies of mass leaflet drops in the Pacific Northwest, which built off and considerably extended the general idea of communicative flows laid out in *The People's Choice*. Dodd and his students meticulously charted geographical diffusion pathways, as well as maximally efficient ratios of leaflets dropped to reception of the message (DeFleur & Larsen, 1987, pp. vii–xxxiv; Dodd, 1952; Lowery & DeFleur, 1995, pp. 213–237). Their work gave rise to a series of additional studies and publications that advanced the mediated-and-interpersonal diffusion model of mass communication, with specific attention to news stories (e.g., Danielson, 1956; Deutschmann & Danielson, 1956; Larsen & Hill, 1954;) and rumor (e.g., DeFleur, 1962). Meanwhile, rural sociologists at Iowa State University studying the adoption of modern farming practices developed their own pictures of the roles played by mass media and face-to-face contacts in the diffusion of information (Beal & Bohlen, 1957; Rogers, 1962; Rogers & Beal, 1958; see also Valente & Rogers, 1995). Through the 1960s, the model of flows contributed to what Everett Rogers (1978) would call the dominant paradigm of development research, partly organized around the idea that “mass communication was [. . .] a very powerful and direct force for development.”

Columbia sociologists rarely cited the Washington group's work, however, nor much from Chicago, choosing instead to solidify their own lineage as it passed from Lazarsfeld and Merton to their favorably placed and influential network of former students through what Terry Nichols Clark (1998) has called the “Columbia sociology machine.” Even then, however, Columbia media studies varied, with some more favorably placed and better amplified by the machine than others. A number of excellent studies lay clearly outside the realm of Lazarsfeldian effects or two-step flow studies – including Leila Susmann's (1956) study of mail to the president, Warren Breed's (1955, 1958) critical functionalist accounts of news, and Charles Wright's (1959) synthetic introduction to a functionalist sociology of mass communication. Katz and others consolidated the two-step flow and diffusion ideas, however, and underscored the argument from *Personal Influence* that media power to bring about change was relatively limited (Coleman, Katz, & Menzel, 1957; Katz, 1957, 1960). This line of second-generation Columbia thinking would eventually rise to symbolic dominance.

Consolidation and Challenge in the 1960s

Joseph Klapper's *Effects of Mass Communication* came out in 1960, consolidating the conceptual vocabulary of “effects” by surveying a wide but also limited body of social

scientific research on mass media. A broader and more subtle book than typically portrayed in the collective memory of media studies, Klapper's volume charted a range of effects of persuasive communication, from reinforcement (most prevalent) to the creation of opinion on new issues as well as conversion, along with specific consideration of portrayals of crime and violence, "escapist media," child audiences, and media-induced passivity. Klapper, who had taken his doctorate at Columbia and then gone to work in the research departments of CBS and General Electric, wrote as a skeptical social scientist surveying certifiable knowledge on the topic. His easy-to-read introduction summarized findings that provided fodder for a limited-effects understanding, including the much-repeated line, "Mass communication *ordinarily* does not serve as a necessary and sufficient cause of audience effects, but rather functions among and through a nexus of mediating factors and influences" (Klapper, 1960, p. 8). The book's conclusion would warn against "the danger [. . .] to go overboard in blindly minimizing the effects and potentialities of mass communications" (p. 252), identify ways that media can exercise "extensive social effects" by operating through elites (p. 253), and call for more attention to "the probable but unmapped interplay between the mass media and cultural values" (p. 255). As Roger Brown (1970) observed, the book's claims about limited media power received much more attention than its feints toward more powerful effects, an interpretation and uptake which in turn served the interests of CBS and other broadcasters faced with criticism about their offerings and accusations of their deleterious social consequences. In this respect, the paradigm did indeed deflect criticism from powerful media industries, as Gitlin and other critics would argue.

Klapper's book was widely cited, though its real influence is harder to discern. The Columbia two-step flow and effects models were both extended and criticized in the 1960s. Raymond Bauer (1964) condensed the limited effects hypothesis into the image of the "obstinate audience," which he flatly declared "a defense [. . .] of advertising and mass media" (p. 327), admitting a charge that critical researchers would later make of the paradigm. Lazarsfeld and Menzel (1963) posited a "multi-step flow of communications," while others distinguished relay and reinforcement functions of opinion leaders (Deutschmann & Danielson, 1960), drew attention to differences between diffusing information and persuading when it came to two-step flows (Troidahl, 1963), or refined the theory by adding categories like "opinion avoiders" and "opinion sharing" (Troidahl & Van Dam, 1965; Wright & Cantor, 1967). Other research called the two-step flow model into question, though, including studies of news diffusion for major events like the Kennedy assassination (Greenberg, 1964; Mendelsohn, 1964; Spitzer, 1964–1965). Agricultural diffusion researchers found the two-step flow model to be overly simplified and misleading, and found that both opinion leaders and followers were directly influenced by media sources, though at different stages of the adoption process (van den Ban, 1964). Others argued that the two-step flow model had never been adequately confirmed empirically (Arndt, 1968). From the perspective of Chicago sociology, Kurt and Gladys Lang (1968) offered a more culturalist alternative, building on a decade and a half of

pioneering work definitively outside the Columbia orbit. Interestingly, in the definitive compilation of media effects research of the era, the two-step flow model received very little attention (Schramm & Roberts, 1971).

By the early 1970s, it was clear to empirical researchers that “the two-step hypothesis appears to explain very few communication situations and is likely too simplified a concept for great utility in explaining the process of communication” (Bostian, 1973). Katz himself had turned away from short-term effects and diffusion to revive Herzog’s gratifications paradigm (Blumler & Katz, 1974; see also Katz, 1968), and Noelle-Neumann (1973) had called for a return to the concept of powerful mass media. From England, Jeremy Tunstall’s (1970) *Media Sociology* collection pivoted away from the US effect and flow models (p. 5) and toward two dozen essays that cast media in broad social and institutional terms. From the international New Left, Richard Hoggart and Stuart Hall’s Centre for Contemporary Cultural Studies was about to enter its most creative and influential phase in Birmingham, while Latin Americans were working out their own Marxian-inspired theories of dependency, domination, and resistance. In the United States, as left-leaning US sociologists invented and attacked “mainstream sociology” (Calhoun & VanAntwerpen, 2007), a new generation of media sociologists led by Gaye Tuchman (1978) cast broad attention to the institutional power, “symbolic annihilations,” and ideological dimensions of the media, at the same time that James W. Carey (1975) was laying the groundwork for US-style cultural studies. By the time Gitlin (1978) weighed in with his influential critique, the limited effects model was clearly on its down slope, with critics both within and outside objectivist social science.

Limited Effects Since the 1980s

By the mid-1980s, the “limited effects model” had become a rhetorical commonplace in mass communication and media studies, used to talk about, separate, normatively rank, and (de)legitimate competing theories and orientations. The “limited effects” locution was given a phantom history, with references to Klapper and other sources where it didn’t occur (e.g., Moschis & Moore, 1982). It would take its place in a mythic historical narrative of the field anchored on the far end by the “hypodermic” model of direct media injections into the masses, to which “limited effects” was a supposed response (Lubken, 2008). As these misrememberings were occurring, Elihu Katz (1980, 1987) substantively responded to and dialectically incorporated Columbia’s critics into the effects tradition, extending the idea from *Personal Influence* that all studies of media in some sense concern themselves with effects. Working with an expansive theoretical tent, he distinguished theories of limited and powerful effects, charted a history of their development, and defended Lazarsfeldian-style communications research as it had developed after the classic work of the 1940s and 1950s.

Adding further counterweight, former Columbia Yale social psychologist and persuasion researcher William McGuire (1986) savaged the claims and empirical evidence in dismantling what he called the “myth of massive media impact” and defending the idea of limited effects (cf. Zaller, 1996).

Katz and McGuire were responding to the fact that the limited effects model had come to serve as a discredited alternative against which some alternate approach was framed as superior – be it cultural studies (Curran, Gurevitch, & Woollacott, 1982; Hall, 1982), political economy (Schiller, 1989), humanistic rhetorical studies (Gronbeck, 1984), or competing social scientific theories like agenda setting (McCombs, 1981), political socialization (Chaffee & Hochheimer, 1985; Moschis & Moore, 1982), or information processing (Entman, 1989). In short, in the 1980s, “limited effects” came to serve as a symbolic boundary marker with considerable rhetorical power in teaching, textbooks, and research about media.

The opinion leader and two-step flow components of the model have in the meantime taken on new life in network theory and studies of Internet-related diffusion. Heinz Eulau (1980) and Katz’s student Gabriel Weimann (1982, 1994) joined Columbia ideas to a new generation of network analysis techniques. Others incorporated part of the classic model into increasingly sophisticated network models that tracked diffusion (Valente, 1996), social capital (Burt, 1999), and marketing and social epidemics (Watts, 2007; Watts & Dorrs, 2007). Featured as the Number One “Breakthrough Idea” of 2007 in the *Harvard Business Review*, Duncan Watts’s notion of the “accidental influentials” shifted attention from influential individuals to network structures that allow influence to cascade widely. Campaign researchers continue to find variations on the two-step flow idea useful (e.g., Hornik, 2006; Southwell & Yzer, 2007). It has provided a tool for mapping Internet-related diffusion and influence patterns related to medicine, politics, and climate change campaigns, among other topics (Case, Johnson, Andrews, Allard, & Kelly, 2009; Nisbet & Kotcher, 2009; Norris & Curtice, 2008). The Columbia flow paradigm lives on, and helps to explain one family of mediated social processes. More recently, it has been joined by a revival of the idea of limited effects within political communication and persuasion research; reflecting on “the continued detachment of individuals from group-based society, and the increasing capacity of consumers to choose from a multitude of media channels,” Lance Bennett and Shanto Iyengar (2008), for instance, have argued that we are entering “a new era of minimal consequences” (pp. 708, 725; see also Bennett & Iyengar, 2010; Holbert, Garrette, & Gleason, 2010).

Conclusion

The rise and fall of the limited effects model turns out to be a more complex and interesting story than might be suggested by its place in the collective imagination

of contemporary media studies. Let me end by summarizing and reflecting on what I take to be some of the lessons of this historical episode. I have traced some of the intellectual, institutional, and rhetorical origins and fault lines of the model and shown how these developed over time. It grew out of Columbia's Office of Radio Research in the early 1940s, mediated through women interviewers in three small provincial cities, and taking shape through the objectivist language and middle-range theory of Columbia sociology. The "two-step flow of communications" was one of those middle-range theoretical concepts, linked in its development to the conceptual problematics of propaganda and public opinion, the new research method of the panel interview, and funded investigations that served the purposes of media organizations and commercial marketing as well as progressive tolerance campaigns and the social scientific pursuit of new knowledge. The two-step flow came to be linked to a view of the mass communication process that posited a number of intervening psychological and social mechanisms limiting the ability of purposive media campaigns to change people's attitudes and behaviors. This finding led to the conclusion that most of the time media play a reinforcement role. Together, these semi-independent elements came together into what its critics named the limited effects model.

Since the 1950s, the flow, limiting mechanisms, and reinforcement ideas have all found places in a range of research and thinking. This traverses work done both within the Columbia lineage and by critics of it. The "discovery" of people as intermediaries and disseminators fed into both research and practice in diffusion, development, marketing, and psychological warfare. It is one of the birth points for understanding communication networks and flows. The idea that audiences can be "obstinate," resisting the efforts and messages that come to them through mass media, has in turn fed images of the active audience in uses and gratifications research. Since the 1970s, active audiences have also been a staple in cultural studies, though rarely with positive acknowledgment of the Columbia tradition that preceded it. Audiences who resist or put media to active work in their social environments have been heroes across wide swaths of media studies, which from a grander historical vantage point complexifies and disperses core insights of 1940s Columbia work. Reinforcement, meanwhile, is itself a core concept in Marxian and other critical media studies, worked out through Althusserian, Gramscian, Foucauldian, and other theoretical idioms. The Columbians came to their conclusion from very different political and intellectual horizons, but their baseline conclusions about media's power to reinforce dominant attitudes, public opinions, and behaviors clearly pointed in complementary directions (Katz, 1980, p. 134). That they rarely drew that conclusion – Lazarsfeld and Merton (1948) being an exception – is of course significant, and supports their critics' charge that their middle-range theory was sociologically myopic and obfuscating. Still, as Katz (1987, 2005) has skillfully shown, a good number of contemporary research programs can be cast as extensions of early Columbia insights. Though the limited effects model was itself rather limited, it still flows through our histories and contemporary work.

NOTE

- 1 Rothschild (1978) cites a 1973 Association for Education in Journalism (AEJ) conference paper by Jay Blumler and J. M. McLeon, "Communication and Voter Turnout in Britain," that uses the term "limited effects."

The Political Economy of Communication

An Idiosyncratic Presentation of an Emerging Subfield

Robert W. McChesney

ABSTRACT

The political economy of communication has three main components. First, it addresses *in a critical manner* how the media system interacts with and affects the overall disposition of power in society. Second, it examines how market structures, advertising support, labor relations, profit motivation, technologies, and government policies shape media industries, journalistic practices, occupational sociology, and the nature and content of the news and entertainment. The detailed examination of the policymaking process is the third core component. Political economic analysis suggests that media development has been inflected most strongly at critical junctures, moments when media technologies, political power, and economic structures simultaneously undergo stress and change. The present moment suggests the potential for political economic study of the media to have real impact.

What follows is an idiosyncratic presentation of the area of research called the “political economy of communication” or the “political economy of media.” I justify this approach because the subfield is small and has only a loosely recognized canon at this point. My aim is to contribute to the process of developing our understanding of this field of research, its history, the great influences upon its development, and its immense potential and importance going forward.

Political economy of communication has three main components. First, it addresses *in a critical manner* how the media system interacts with and affects the overall disposition of power in society. Do the media, on balance, serve as a progressive force to draw people into political debate as informed and effective participants, or does the media system as a whole tend to reinforce elite rule and inequalitarian social relations? This is a topic of concern for more than political economists – in fact it drives much of communication research, especially cultural studies – but it is always central to the political economic tradition. It requires a certain command of history and political theory. Simultaneously, and of necessity, this requires looking at how the media and communication systems were integrated into the economy. This requires some facility with economics.

Now what I meant by “in a critical manner” gets to the nub of the matter. There are many different measures one could use, and over time the one I emphasize rests upon the provision of journalism, or, more broadly, the information necessary for self-government and effective freedom. In my view, the media system, with particular emphasis upon journalism, needs to provide several services to meet the communication requirements of a free and self-governing people. The media system needs to keep a ruthless check on people who are in power or who wish to be in power, whether in the public or private sector. The media system has to be a watchdog. It has to be capable of ferreting out truth from lies, so liars cannot prevaricate endlessly, shamelessly, and without consequence. And the media system has to provide a range of informed opinion on the crucial social and political issues of the day, as well as be the advance scout to locate problems on the horizon.

Not all media have to do all of these things, but in combination a healthy media system makes these services available to the great bulk of the citizenry, and does not discriminate against people based on race, class, or gender. If it fulfills these criteria, the media system would be a democratic force in society. Now if one looks at the list closely, these are all classical liberal criteria; when applied to other nations or to history, they are not especially controversial. But when such criteria are applied to the United States, or the US role in the world, without pulling punches, the results are generally unflattering, and the critique is regarded as radical. And it is radical, because the logic of the critique suggests that structural reform of the media system and society is necessary if we are serious about democracy.

In addition, what this first area of the political economy of communication suggests is that the relationship of media to society is not a one-way flow. Not only does democracy require viable media and journalism to prosper; so, too, do media and journalism require healthy democracy and strong popular politics to survive and be effective as progressive institutions. It is a close and symbiotic relationship.

The second area in the political economy of communication tradition is largely its exclusive domain: an evaluation of how market structures, advertising support, labor relations, profit motivation, technologies, and government policies shape media industries, journalistic practices, occupational sociology, and the nature and content of the news and entertainment. This requires a certain mastery of microeconomics,

history, journalism, and policy studies at a minimum. While some legal scholars, political scientists, and economists are interested in these questions too, they rarely are interested in the critical implications for society as a whole. They are content to accept the status quo as an unalterable given. And when one accepts the status quo as an unalterable given, it doesn't take long before it starts to seem benevolent. Political economy by definition is a critical enterprise (Gandy, 1992).

The detailed examination of the policymaking process is the third core component of political economy of communication. When one examines the policymaking process, one can see what the real options are and have been, and why a system later regarded as "natural" got put in place as it did. Policymaking is becoming a new area of intense research in communication. The research places particular emphasis upon what I term "critical junctures," the moments in policymaking history when the range of debate is relatively broad and society can go in any number of directions with its media policies and subsidies. Much of this research has a strong historical component.

The notion of critical junctures explains how social change works; there have been relatively rare and brief periods in which dramatic changes were debated and enacted drawing from a broad palette of options, followed by long periods in which structural or institutional change was slow and difficult (Collier & Collier, 2002). During a critical juncture, which usually lasts no more than one or two decades, the range of options for society is much greater than it is otherwise. The decisions made during such a period establish institutions and rules that likely put us on a course that will be difficult to change in any fundamental sense for decades or generations.

This notion of critical junctures is increasingly accepted in history and the social sciences. It has proven valuable for thinking broadly about society-wide fundamental social change, and also as a way to understand fundamental change within a specific sector, like media and communication. The two types of critical junctures are distinct, yet very closely related. Most of our major institutions in media are the result of such critical junctures, periods when policies could have gone in other directions, and, had they done so, put media and society on a different path.

As a result of my research, I have concluded that critical junctures in media and communication tend to occur when at least two if not all three of the following conditions hold:

- There is a revolutionary new communication technology that undermines the existing system.
- The content of the media system, especially the journalism, is increasingly discredited or seen as illegitimate.
- There is a major political crisis – severe social disequilibrium – in which the existing order is no longer working and there are major movements for social reform.

In the past century, critical junctures in media and communication occurred three times: in the Progressive Era, when journalism was in deep crisis and the overall

political system was in turmoil; in the 1930s, when the emergence of radio broadcasting combined with public antipathy to commercialism against the backdrop of the Depression; and in the 1960s and early 1970s, when popular social movements in the United States provoked radical critiques of the media as part of a broader social and political critique.

The result of the critical juncture in the Progressive Era was the emergence of professional journalism. The result of the critical juncture in the 1930s was the model of loosely regulated commercial broadcasting, which provided the model for subsequent electronic media technologies like FM radio, terrestrial television, and cable and satellite television. The result of the 1960s and 1970s critical juncture is less tangible for communication. In many respects the issues raised then were never resolved and they were buried by the neoliberal epoch that followed.

Today, we are in the midst of a profound critical juncture for communication. All three conditions for a critical juncture are already in place, the first *trifecta* in at least 80 years in the United States: the digital revolution is overturning all existing media industries and business models; and journalism is at its lowest ebb since the Progressive Era. The third condition – the overall stability of the political and social system – is the most important and the great unknown. Our overall political system is awash in institutionalized corruption and appalling inequality. The economy is mired in the worst stage of secular stagnation since the 1930s and it appears likely that we are entering a period of structural transformation to points unknown. The entire public sector of pensions, education, and healthcare is under sustained and relentless attack. US global military dominance is wobbling with the disaster of the various Asian wars, and the combination of empire and republic is difficult to maintain.¹ In January 2007 the *Bulletin of the Atomic Scientists* moved its symbolic doomsday clock to five minutes to midnight. For the first time ever, the editors stressed the role of not just nuclear weapons but of global climate change in the impending catastrophes facing humankind. This is becoming a political and social crisis of major proportions.²

In 2011 the other shoe fell that demonstrates that we are indeed entering mostly uncharted historical waters, at least by recent standards. The battle was joined, first on the snowy streets of Wisconsin and then, by the end of the year, in hundreds of “Occupy” protests across the nation. The system is failing and millions of US citizens stood up to say “We choose to live.” Even more impressive uprisings have occurred across the world, and have overturned governments in the Middle East. Given the structural crisis of capitalism, there is every reason to believe this is the start of something big. It is this precise moment that makes the work of critical scholars in general suddenly relevant and no longer “academic.” It is especially true for those working in the political economy of communication, because media issues are central to the upheavals.

It is worth noting that the study of the political economy of communication first emerged and thrived as a response to critical junctures. It is then that the types of questions political economists of communication ask seem especially pertinent, and connect to social movements off-campus. In quiescent periods, in contrast, political

economy of communication tends to stagnate and appear irrelevant to the “real world.”

As just noted, this should be the moment in the sun for political economy of communication at US universities. Indeed, in the not too distant past, that was what seemed to be on the horizon. It certainly had a roaring start coming out of the last critical juncture in the late 1960s and 1970s. “I have no doubt that many communication scholars can hardly believe their luck,” the political economist Nicholas Garnham (1983) wrote in the *Journal of Communication*. “After years on the margins of intellectual concern and academic power, we suddenly find ourselves center stage, with the spotlight of social relevance full upon us.” Political economy of communication even had a *de facto* professional organization, the Union for Democratic Communications. Nearly one-third of the articles in the special edition on the future of the field in the George Gerbner-edited *Journal of Communication* in 1983 grew out of the political economic tradition.

In the early 1980s, the foundations of the political economy of communication, such as they are, were in place. Dallas Smythe and Herbert I. Schiller unquestionably were the dominant senior figures associated with the subfield in North America.³ Smythe was a native of Canada who earned his PhD in economics at Berkeley and went on to become the first chief economist at the US Federal Communications Commission in the 1940s. While at the FCC, Smythe was the primary author of the “Blue Book,” the public interest standard for commercial broadcasters that was arguably the most progressive regulation in US broadcasting history (Meyer, 1962a, 1962b; Pickard, 2006; Socolow, 2002). In 1948, he joined the faculty in the newly formed Institute of Communications Research at the University of Illinois. Smythe immediately launched the first formal classes in the political economy of communication – not only in the United States, but possibly the world – and gave the field a toehold in the United States. Before returning to Canada in the 1960s, where he had considerable influence over Canadian political economy of communication, Smythe established himself as one of the foremost figures in US media studies and plowed a wide path for others to follow behind.

During his 15 years at Illinois, Smythe wrote papers on a broad range of topics, including how commercialism is the defining feature of US television; how US broadcast regulation and policy debates were distorted to serve corporate interests; the commercialization of the electoral process; and the elements of propaganda in the US media system. He wrote reports or testified on policy debates surrounding the development of public broadcasting, pay television, satellite communication, and the telephone monopoly of AT&T (Smythe, 1994).⁴ His landmark work from this era addressed telecommunications economics and policymaking, and here too, Smythe was decades ahead of his time in recognizing the need to fuse telecommunications with media in communication research (Smythe, 1957).

After returning to Canada, Smythe remained highly influential. In the 1970s and 1980s he redefined the study of commercial media, challenging the mainstream perspective that the primary relationship within media was that between media and

the audience. Smythe argued that the core relationship, at least for broadcast media, was between the broadcaster and the advertiser. The product of value that was being produced, therefore, was in fact the audience, which was then sold to advertisers. Smythe then argued that the audience was in fact being exploited as it labored on behalf of the media company. His pacesetting work on the “audience commodity” has become central to the political economic tradition and debates in the United States.⁵

Herbert Schiller was a trained economist, too, who became Smythe’s colleague at Illinois before moving to the University of California at San Diego in 1970. He is the single person most commonly identified with the political economy of communication, and in his long and storied career his work covered a broad range of issues. (For an excellent overview of Schiller’s intellectual history, see Maxwell, 2003.) Like Smythe, Schiller looked at communication as an important component of corporate power. His first book, *Mass Communications and American Empire*, argued that communication and culture were an indispensable and growing part of the US global economic, political, and military agenda. It became the work that defined the debate on media or cultural imperialism for the next generation. To provide some sense of what a departure this was from thinking at the time, Schiller could find no publisher for the book among university or commercial presses, and had to rely upon a small publishing house that specialized in out-of-print economics classics, and was managed by an old friend (Schiller, 1992).⁶ Schiller wrote several more books in his career. His greatest work, in my opinion, was 1989’s *Culture, Inc.*, published just before his 70th birthday, in which Schiller made a compelling argument about the excessive commercialization of culture and everyday life in the United States and its anti-democratic implications. The book includes, among other things, a superb analysis of the commercialization of the First Amendment, one of the best critiques of the “audience has all the power” argument, and a discussion of the privatization and commercialization of information and data services and how this pertains to communication (Schiller, 1989).⁷

Together, Smythe and Schiller made the crucial and original argument that communication was becoming a central component of capitalist accumulation, with significant and striking implications for both communication and capitalism. They viewed communication and information – journalism, entertainment, libraries, museums, telecommunication – as a totality. Smythe and Schiller were making a historically specific argument about contemporary capitalism, one that had strong implications for politics. In many respects, these can be regarded as the founding observations upon which the political economy of communication is based. It was an argument made not just to communication scholars, but to political and social theorists and scholars in general, whom they believed undervalued the importance and role of communication. (The classic piece in this regard is Smythe, 1977.)

Smythe and Schiller were products of the great critical juncture of the 1930s and 1940s. They waded through the dark years of the 1950s and then dove headfirst into the tumult of the 1960s and 1970s. Although Smythe left for Canada in the early

1960s, he had helped lay the groundwork by participating actively in political discussions in Congress and in as many public forums as possible about satellite communication and other policy issues. By the late 1960s, Schiller began to forge contacts with the progressive FCC commissioner Nicholas Johnson and with media reformers connected with the civil rights and antiwar movements. Smythe and Schiller's influence can be seen on a whole range of progressive reforms that emerged in that period: policies encouraging minority employment in the telecommunication and broadcasting industries; issues around concentration of ownership and cross-ownership (from blocking the ITT/ABC merger to pushing the "FinSyn" rules that prevented vertical integration in the television industry); and of course extending the earlier tradition of concern with the rights of viewers. Schiller is best known for his active role in publicizing and supporting efforts for a New World Information & Communication Order through UNESCO in the 1970s and 1980s.⁸

Finally, Smythe and Schiller both worked tirelessly to spawn a new generation of communication scholars working in the political economy tradition. Most of the next generation of scholars, which came of age in the 1970s and 1980s, had relationships with one or both of them. I was at the end of that generation and both of them embraced me and my research with open arms. They set the bar very high for those who followed.

Although Smythe and Schiller can be regarded as the founders of the field, Edward S. Herman and Noam Chomsky played every bit as large a role for me and for many others who studied the political economy of communication. Herman was an economist who taught at the Wharton School of Finance at Penn, and he occasionally taught media courses at the university's Annenberg School. He was well aware of the field and close to Schiller. Chomsky was a linguist at MIT. Although I believe that linguistics belongs in the broader domain of communication studies, there wasn't much overlap between Chomsky's revolutionary research in linguistics and his prodigious analysis of media and politics.

Herman has made foundational contributions to the political economy of communication. He employed public good theory and microeconomic analysis to provide the basis for a critical assessment of media markets, one that did not presuppose profit-seeking media as inexorably "giving the people what they want" (Herman, 1993). Herman's work gave me increased respect for how the liberal tradition in mainstream economics could be used to great effect in understanding media industries.

Most important, along with Chomsky, Herman developed the "propaganda model" to explain the pro-elite and anti-democratic bias built into US news media coverage of public affairs. The propaganda model uses five filters – media ownership, advertising, sourcing, flak, and anti-communist ideology – to explain how very similar stories get radically different press treatment depending on their relationship to US elite interests. Stories that serve elite interests, like the Soviet downing of Korean Airlines flight 007 in 1983, receive extensive coverage and the treatment is full of outrage and sympathy for the victims; stories that go against US elite interests, like the US-allied death squads that murdered tens of thousands of civilians in Central

America in the 1980s, barely rate a mention. The US role is downplayed, and the victims are regarded with suspicion (Herman & Chomsky, 1988). The system works not through any form of conspiracy; it is a “guided market” system where core values are internalized so that the story selection process seems natural and proper. Herman (1998) updated the propaganda model in the 1990s to account for the collapse of the Soviet Union. The propaganda model remains a useful reference point for critical assessments of the news media, and, as I discuss at the end of this chapter, is one of the signal contributions of the political economy of communication.

Herman earned his PhD in economics at the University of California at Berkeley, which was a locus for critical and institutional approaches to economics during the middle decades of the twentieth century. The most important figure at Berkeley was Robert A. Brady, who in the 1930s conducted pacesetting research on the relationship of business to policymaking. Brady (1937, 1943) compared the situation in Nazi Germany and fascist Italy with the United States, and saw parallels in the use of media, public relations, and advertising to control public opinion. In this sense his work dovetails the outer limits of what communication scholars like Paul Lazarsfeld were broaching at the same time. As Dan Schiller (1999) demonstrates, Brady’s work was influential on Smythe and Herbert Schiller.

Noam Chomsky is the scholar who revolutionized the study of linguistics and ranks among the most prominent US intellectuals of the past hundred years. Beginning in the 1960s Chomsky began a parallel career as a social critic and activist, and soon he was arguably the best-known and respected radical critic of US foreign policy in the world. In the course of developing his criticism of international politics, Chomsky began to critique US news media coverage of foreign affairs, which he found highly propagandistic on behalf of elite interests. It was this work that led to his collaboration with Herman and the development of the propaganda model in the late 1980s. Chomsky’s contributions to the political economy of communication go beyond his collaboration with Herman. His own writings in the 1980s, most notably 1989’s *Necessary Illusions*, developed a rich media critique that pursued the tension between capitalist and democratic societies. Chomsky, more than any other figure, argued that the United States was far from being a genuine democracy, and that the media system played a major role in cementing inequalitarian class relations. His work drew from a critical reading of mainstream scholarship and a rich understanding of the classical and Anglo-American democratic traditions.

Chomsky’s courage in forcefully critiquing communist countries while refusing to budge from his democratic, egalitarian, and radical principles influenced me a great deal. His commitment to rationalism, to evidence, to clear thinking, and his refusal to hold any sacred cows was intoxicating. Chomsky also, for the power and the principled nature of his critique, was remarkably open-minded and pragmatic about the process of making social change. His work with Herman became the prism through which my critique of news media, and much else, would be developed.

I also began to devour the work of Brits like Garnham (Garnham, 1979, 1985, 1983; Garnham & Bakewell, 1978; Garnham, Collins, & Locksley, 1988;), James

Curran (Curran, 1977, 1978, 1980, 1981, 1986; Curran, Smith, & Wingate, 1987), Peter Golding (Golding, 1974a, 1974b; Golding & Elliott, 1979; Golding & Middleton, 1982; Golding & Murdock, 1978; Golding, Murdock, & Schlesinger, 1986; Sills, Taylor & Golding, 1988), and Graham Murdock (Halloran, Elliott, & Murdock, 1970; Murdock, 1978, 1989a, 1989b; Murdock & Golding, 1989; Murdock & Janus, 1984; Murdock & Phelps, 1973; Schlesinger, Murdock, & Elliott, 1983). This was the gold standard; the four of them and their British cohort staked out the parameters for political economic analysis of communication. Golding and Murdock often wrote together, and their seminal 1973 essay in the *Socialist Review* effectively introduced the notion of the political economy of communication to the world at large (Murdock & Golding, 1974). I examined the emerging US tradition, too, reading the younger generation of scholars like Vinny Mosco, Dan Schiller, Oscar Gandy, Eileen Meehan, Manjunath Pendakur, Stuart Ewen, Eileen Mahoney, Sut Jhally, and Janet Wasko.⁹ One of the truly important works of the political economy tradition was a path-breaking and underrecognized collection called *The Political Economy of Information* edited by Mosco and Wasko (1988).

As impressive as this tradition was, even in its most dynamic phase there were only a relatively small number of scholars working in the area, and many important areas were unaddressed. The political economy of communication seemed like a great idea, but it was an idea still crystallizing. Therefore, I read widely in a number of other disciplines. In time, by the early 1990s, I cobbled together my own vision of what the political economy of communication entailed. When I read Vinny Mosco's admirable *The Political Economy of Communication* upon its publication in 1996 – arguably the first systematic effort to define the subfield – I realized there really was no consensus about the core issues and readings; everyone was cobbling just like I was.

In addition to the work being done inside the subfield, my understanding of the political economy of communication drew from a handful of intellectual traditions, only a little of which was found within the field of communication. In just about everything I taught, and in the formation of all my arguments in all of my research, these traditions have played a foundational role. They include:

- 1 The *Monthly Review* political economy of Paul Baran, Paul Sweezy, and Harry Magdoff.
- 2 The political sociology of C. Wright Mills and Jürgen Habermas.
- 3 The work on technology and communication of Harold Innis, Marshall McLuhan, and Neil Postman.

In each of these traditions there were a number of scholars who influenced me, but I will mention the signature figures herein.

First, there was the *Monthly Review* political economy of Paul Baran, Paul Sweezy, and Harry Magdoff, which highlighted the nature and importance of monopoly and corporations in modern capitalism. Sweezy, arguably the most original and brilliant

US Marxist economist of the twentieth century, expanded upon Thorstein Veblen's work, and also drew from Marx and the left Keynesian tradition to produce the definitive treatment of modern corporate or "monopoly" capitalism.¹⁰ He also studied under Harold Laski and Joseph Schumpeter. This school of work is called the *Monthly Review* tradition after the magazine Sweezy founded in 1949 with Leo Huberman, and later co-edited with Harry Magdoff.¹¹
